v.124 Jl-Dec. 1929

INDEX

Illustrated articles indicated by *

A

Aarst, H.:
Synthetic Molding Sand, July 18 p 152

Abbott, Charles F.:
Courageous Spending in Industry, Oct 3 p 901
Rationalizing Output, Oct 3 p 912
Salesmanship, Dec 19 p 1680
Structural Steel Mart Bears Fruit, Aug 1 p 299
Urges Creative Spending, Dec 12 p 1632

Accidents:
Carrie Furnace Lost-Time Record, Dec 26 p 1736
Foundry, Study of*, Oct 10 p 964
Prevention Contest at Springfield, Nov 7 p 1284
Railroad, in Great Britain (Editorial), Sept 26 p 851
Reduced by Conveyors*, Oct 24 p 1098

Acheson Medal:
Awarded to Edward G. Acheson, Sept 26 p 826

Acids:
Tests During Pickling, Nov 7 p 1288

Adam, A. T.:
Wire for Mining Rope, Oct 10 p 956

Adams Co.:
Milling Head for Planers*, Oct 3 p 905

Advance Diamond Tool Co.:
Grinding and Lapping Machine*, Dec 19 p 1671

Advertising:
Against Use of Word Only, July 4 p 40

Aeronautics:
Symposium on Electrochemistry in, Sept 26 p 832

Agnew, Dr. P. G.:
Role of Trade Associations in Standardization, Oct 31 p 1172

Aircraft:
British Disaster Caused by Fatigue of Steel, Sept 5 p 600
Dirigible ZMC-2, All-Metal*, Aug 22 p 453
Dirigibles, Trend in Design, Nov 7 p 1240
Engines, Developments, Dec 12 p 1596
Goodyear-Zeppelin, Factory and Dock for*, Oct 3 p 885
Graf-Zeppelin Crankshaft Failure, Sept 12 p 672
Growing Size of Industry, Sept 5 p 648
Light Alloys for, Sept 5 p 615
Mass Production in Waco Plant*, July 4 p 1
Metal Supplanting Wood in Construction, Sept 19 p 778
Metals Used in Making Airplanes*, July 25 p 211; Aug 8 pp 360, 361
Parts, Heat Treating*, Aug 29 p 519
Passenger Depots, Designs for*, Oct 17 p 1023
Rust-Proofing Steel and Aluminum Parts, Aug 15 p 409
Tubing, Flash Welds on*, July 25 p 214

Airports:
In United States, Nov 28 p 1456

Alemite Die Casting & Mfg. Co.:
Intricate Castings from Automatic Dies*, Oct 10 p 968

Alexander, Magnus W.:
Economic Evolution of United States, Nov 28 p 1463
Suggests International Statistical Bureau, July 11 p 131

Allegheny Metal:
Sheets, Cover Corridor Bridge*, July 18 p 158

Alloy Steel:
(See Also Steel)
Colhed, Aug 22 p 480
Definition for, Dec 12 p 1594
Gains in (Editorial), July 18 p 172
In the Railroad Field, Dec 12 p 1592
Past and Present, July 11 p 108
Production, 20 Years*, Aug 29 p 544
Quantity of Each Type Made in 1928, Dec 26 p 1735
Ratio to Carbon Steel Production, Sept 5 p 648
Spark Testing*, Oct 10 p 953
Structural, Tests on Columns*, Nov 14 p 1300
Studies on, Oct 24 p 1112
Trends in, Dec 12 p 1593
Unusual Uses for (Editorial), July 11 p 106

Alloys:
Aluminum-Copper, Thermal Conductivity*, Oct 17 p 1036
Aluminum, Forge Shop, Dec 5 p 1521
Aluminum, Heat Treating, Aug 29 p 514
Aluminum, in Aeronautics, Sept 26 p 832
Beryllium, in Aircraft Construction, Sept 26 p 833
Brass, P. M. G., Aug 29 p 548
Chrome-Nickel Stainless*, Oct 3 p 887
Hascrome, Hard Surfacing, Nov 7 p 1279
Iron, Castings, Ascendency of, Aug 1 p 282
Iron, Engineering Foundation Committee to Study, Oct 3 p 940
Light. for Aircraft, Sept 5 p 615
Low-Ex for Gas Engine Pistons, Aug 29 p 561
Magnesium, in Aeronautics, Sept 26 p 833
Non-Ferrous, Melting in Cupola, Aug 22 p 502
Pure Manganese and Manganese-Iron, Oct 24 p 1111
Pyrasteel, Chicago Heat Resisting*, Aug 29 p 538
Zinc Base for Die Castings*, Dec 19 p 1655

All-Metal Construction:
White Castle System*, Aug 1 p 281

Aluminum:
Alloys, Discussed by British and German Metallurgists, Oct 3 p 914
Alloys, in Aeronautics, Sept 26 p 832
Alloys, Solution Potentials of Corrosion and, Sept 26 p 833
Automobile and Cooking Utensil Consumption, Sept 26 p 852
Cans, Experiment in Norway, Oct 31 p 1201
Chrome Plated, Aug 1 p 325
Electroplating on Steel, Sept 26 p 833
Production, 1928, Sept 19 p 776
Progress, Display*, Sept 19 p 737
Used in Architecture*, Nov 21 p 1361; (Editorial) p 1397

Aluminum Co. of America:
Fairfield Jobbing Foundry*, Aug 15 p 406
Forge Shop for Aluminum Alloys, Dec 5 p 1521
Low-Ex Alloy, Aug 29 p 561

American Association of Engineers:
New Constitution, Oct 10 p 976

American Bolt Co.:
Acquired by Lake Erie Bolt & Nut Co., Aug 22 p 485

American Car & Foundry Co.:
Annual Report, July 4 p 51

American Chain Co., Inc.:
"Don'ts" for Chain Users, Aug 1 p 265

American Drop Forging Institute:
Convention Proceedings, Oct 3 p 912

American Electric Furnace Co.:
High-Speed Furnace*, Aug 29 p 533

American Electrochemical Society:
Convention Proceedings, Sept 26 p 825
Spring Meeting Convention Program, Oct 24 p 1119

American Engineering Council:
Reviews Patent Bills, Oct 31 p 1191

American Forge Co.:
Development of Upset Forgings*, Dec 5 p 1513

American Gear Manufacturers' Association:
Convention Proceedings, Oct 31 p 1171

American Institute of Steel Construction:
Annual Meeting, Nov 14 p 1328; Nov 21 p 1376
Buildings 2000 Ft. High Structurally Possible, Oct 10 p 1016
New Method of Sales Promotion Work, Aug 22 p 485
Selects Most Beautiful Bridge Built in 1928*, Nov 7 p 1231
To Hold Trade Practice Conference, Sept 26 p 870

American Institute of Weights and Measures:
Nominations to Fill Vacancies, Nov 7 p 1244

American Iron and Steel Institute:
Honors Charles M. Schwab for Service in Steel Industry*, Oct 3 p 915
Fall Meeting Proceedings, Oct 31 p 1165
Pig Iron and Ferroalloys Production First Half 1929, Aug 15 pp 419, 420
Steel Ingot Production by Months, June, p 101; July, p 425; August, p 685; September, p 985

283380

(*American Iron and Steel Institute, continued*)
Trackwork Shipments, June, p 168; July, p 586; August, p 780; September, p 1048; October, p 1481; November, p 1715

American Management Association:
Convention Proceedings, Nov 14 p 1319

American Manganese Producers' Association:
Convention Proceedings, Sept 12 p 684; Sept 19 p 780

American Puddled Iron Co.:
To Take Over Warren Plant, Aug 8 p 378

American Radiator Co.:
Conveyors and Ovens for Large Cores*, Dec 5 p 1516

American Refractories Institute:
Officers, July 4 p 31

American Rolling Mill Co.:
Blast Furnace Record, Sept 12 p 678
Bonus System, Nov 14 p 1319
Continuous Sheet Process Licenses, Oct 3 p 921; Dec 5 p 1560; Dec 12 p 1625
Park Employees' Cars*, July 18 p 167
Safety Record, Sept 19 p 780
To Close Elyria Plant, Dec 26 p 1761

American Society for Steel Treating:
Convention Proceedings, Sept 12 p 693; Sept 19 p 733

American Society for Testing Materials:
1930 Meeting Announcement, Oct 31 p 1191
Aircraft Symposium Planned, Nov 7 p 1244
Convention Proceedings, July 4 p 9
Symposium on Cast Iron as Engineering Material*, July 4 p 6

American Society of Mechanical Engineers:
Annual Meeting, Dec 12 p 1584
Conference on Wire Rope, Sept 26 p 838
Nominations, July 18 p 166
Steel Mill Bearings Research Committee, Sept 19 p 785
Technical Committee Chairmen, Dec 26 p 1761
To Celebrate 50th Anniversary, Oct 10 p 976

American Standards Association:
Campaign to Finance Industrial Standardization, July 18 p 161
Cut and Ground Thread Standards, Nov 28 p 1462
Directors*, July 11 p 104

American Steel & Wire Co.:
Expansion Plans, Nov. 28 p 1486; Dec 19 p 1675
Human Side of High Productivity (Editorial), July 18 p 171

American Tool Works Co.:
Radial Drilling Machine*, Oct 10 p 981

American Welding Society:
Convention Proceedings, Sept 19 p 741
Specifications for Manganese Steel Welding Rod, Aug 29 p 524

Americanizing Industry Abroad:
(Editorial), July 18 p 171

Amtorg Trading Corporation:
Purchases for Russia, Oct 10 p 1014; Oct 17 p 1048

Anderson, Robert J.:
Aluminum Can Be Slush Molded, Nov 28 p 1468
Heat Treating Aluminum Alloys, Aug 29 p 514

Andrews, Toledo, Ltd.:
To Operate Sheffield Works, July 18 p 196

Annealing:
(See Heat Treating)

Apex Machine Co.:
Nut Setter, Universal Joint*, Oct 10 p 981
Lindmark Tool Holder*, Aug 15 p 414
Tool Holders, Full Floating*, Oct 3 p 905

Apprenticeship:
Cleveland Foundry School*, Dec 12 p 1579
Training in Warner & Swasey Plant*, Nov 14 p 1293
Training in Worthington Plant*, Aug 8 p 333
Universal Essential*, July 25 p 203

Architecture:
Use of White Metal in*, Nov 21 p 1361, (Editorial) p 1397

Armor Electric Mfg. Co.:
Abrasion-Proof Induction Motor*, July 18 p 162

Armstrong-Bray & Co.:
Flexible Belt Lacing*, Dec 26 p 1742

Armstrong, Edward H.:
Seadrome, Steel Tonnage*, Nov 14 p 1298

Army Ordnance Association:
Demonstrates New Munitions of War, Oct 17 p 1049

Art Metal Radiator Co.:
Radiator Covers*, Sept 12 p 673

Arter Grinding Machine Co.:
Cylindrical Grinder*, Sept 19 p 672

Associated Machine Tool Dealers:
Officers, Oct 10 p 991

Associated Metal Lath Manufacturers:
Trade Practice Conference, July 4 p 13

Association of Iron and Steel Electrical Engineers:
Electric Heating and Welding Conference with Pennsylvania State College, Nov 21 p 1387

Aston, James:
Wrought Iron Process in Byers Plant*, Aug 8 p 341

Atlas Steel Barrel Corporation:
Trailers for Quantity Delivery*, Dec 12 p 1595

Aufderhaar and Smith:
Molybdenum in Cast Iron*, Dec 5 p 1507

Austin Co:
Contract to Build Russian Automobile Plant, Aug 29 p 578
Creates Foreign Department*, Nov 28 p 1464
Design for Airport Depot*, Oct 17 p 1023
Expansion Plans, Dec 12 p 1632

Auto Specialties Mfg. Co.:
Solderless, Puttyless Skylights*, Nov 28 p 1440

Automatic Transportation Co.:
Merged with Barret-Cravens and Walker Vehicle Companies, Dec 26 p 1759

Automobiles:
Assembling Bodies in Durant Plant*, Nov 21 p 1374
Assembly Plants, World Wide Distribution of American*, July 25 p 225
Bus Bodies, Manufacture in Lang Plant*, Dec 26 p 1732
Consumption of Steel (Editorial), Sept 12 p 691
Exports, 1925-1929 (Editorial), July 25 p 229
Exports, First Half 1929, Sept 26 p 870; Nine Months, Nov 28 p 1456
General Trade and (Editorial), Nov 28 p 1467
Old, as Scrap (Editorial), Oct 24 p 1117
Output, Decline in (Editorial), Sept 26 p 851
Production by Months, June p 102; July p 586; August p 943; September p 1142; October, p 1416; November p 1693
Production Costs in Studebaker Plant*, Oct 3 p 891
Shipping Bodies to Utilize Space*, July 11 p 88
Steel Demand and (Editorial), Oct 31 p 1189

Automotive Industry:
Earnings (Editorial), Aug 29 p 559

Avey Drilling Machine Co.:
Bench Berjo Vises*, Des 19 p 1670

Axes:
Heat Treating Woodsmen's*, Oct 24 p 1094

B

Babbitt Metal:
Scrap, Recovering from Bronze, Sept 26 p 832

Babcock & Wilcox Co.:
Fatigue Tests on Drums and Shells*, Sept 5 p 607
Water Gage for High Pressures*, Oct 17 p 1044

Babson Episode (Editorial), Sept 12 p 690

Baird Machine Co.:
Horizontal Chucking Machine, New*, Nov 7 p 1249

Baker Brothers, Inc.:
Horizontal Drilling Machines, Hydraulic Feeds*, Sept 19 p 754

Baker, Dr. Hugh P.:
Trade Associations Important Business Factors, Oct 24 p 1114

Baker, Dr. Thomas S.:
Future of Coal a Chemical Problem, Dec 26 p 1766

Baldwin Locomotive Works:
To Acquire Southwark Foundry & Machine Co., Oct 10 p 984

Baldwin Tool Works:
Electric Furnaces vs. Gas for Heat Treating*, Dec 26 p 1725

Baling Press:
Galland-Henning Hydraulic*, Aug 29 p 550

Balls, Steel:
Chilled Mold for Making*, Aug 8 p 350

Band Saw:
Laidlaw, for Handling Two Jobs Simultaneously*, Oct 24 p 1109
Oliver, Direct Connected Motor Drive*, Aug 22 p 473

Bank of Manhattan Co. Building:
Record Speed in Steel Erection*, Sept 19 p 730

Barber-Colman Co.:
High-Production Hobbing Machine*, Nov 7 p 1252

Bardenheuer and Zeyen:
Superheating Cast Irons, Sept 12 p 674

Barnes Drill Co.:
Drilling and Tapping Machine, All Geared*, Sept 19 p 754
Gang Drill with Hydraulic Indexing Table*, Dec 5 p 1532

Barnes, Wallace Co.:
Spring Manufacture*, July 11 p 83
Barrett Co.:
Melting Non-Ferrous Metals and Alloys in Cupola, Aug 22 p 502
Barrett-Cravens Co.:
Merged with Walker Vehicle and Automatic Transportation Companies, Dec 26 p 1759
Barrett, Leon J., Co.:
Oil Extractor, Washers and Dryers*, Oct 24 p 1110
Barrett, William J.:
Studies on Migration of Industry*, Oct 24 p 1089
Barrows, W. P.:
Crystal Spots on Plated Ware, Aug 29 p 516
Bars:
Cold Finished, Extras, July 25 p 231
Concrete Reinforcing, Tests, Aug 8 p 361
Batty, George:
Electric Steel for Castings, Sept 26 p 828
Baush Machine Tool Co.:
Nut and Screw Driving Machine*, Aug 15 p 415
Bearings:
Anti-Friction, Investigations, Dec 12 p 1615
Bronze, Best Suited to Lack of Lubricant, Aug 1 p 265
Bronze, Wear Tests*, Nov 28 p 1431
Roller, Hyatt Single Row Radial*, Sept 12 p 682
Roller, on Old Mill Motors*, Sept 12 p 677
Roller, Steel Mill Research, Committee, Sept 19 p 785
Beatty Machine & Mfg. Co.:
Punch, Toggle Beam*, July 25 p 221
Becker, Luther:
American Scrap Exports and Imports, Nov 7 p 1245
Belfont Steel & Wire Co.:
In Receivership, Dec 5 p 1548
Bellevue Industrial Furnace Co.:
To Make Electric Furnaces, Aug 29 p 573
Belt Lacing:
Armstrong-Bray Flexible*, Dec 26 p 1742
Bennington, E. T.:
Designing for Safe Operation, Dec 19 p 1662
Materials Handling Equipment, Advantages of, Dec 26 p 1721
Savings from Use of Materials Handling Equipment, Dec 12 p 1586
Tying Up Production Control with Materials Handling, Dec 19 p 1654
Benson, Capt. Ronald:
Forging Seamless Steel Drums*, Aug 15 p 400
Berg, Cris:
Labor Incentives and Lower Costs, Dec 19 p 1647
Beryllium:
Discussed by British and German Metallurgists, Oct 3 p 914
Editorial, Sept 26 p 850
For Deoxidizing Copper Castings, Oct 3 p 911
German Output, Oct 31 p 1220
In Aircraft Construction, Sept 26 p 833
Best, C. H.:
Economic Production Quantities*, Dec 12 p 1584
Bethlehem Steel Co.:
Warehousing of Bolts and Nuts*, Aug 1 p 283
Bethlehem Steel Corporation:
Buys Pacific Coast Steel and Southern California Iron & Steel Companies, Dec 5 p 1535
Expansion Plans, Oct 31 p 1208; Nov 7 p 1284
Quarterly Report, Aug 1 p 293; Oct 31 p 1208
Steel Plant Capacities, July 4 p 36
Suit Against Steel Corporation Settled, Nov 21 p 1392
To Increase Sparrows Point Capacity, Sept 26 p 870
To Issue New Common Stock, Sept 12 p 714
Betts, Anson G.:
American Costs of Concentrating Manganese Ores, Aug 29 p 561
Foreigners Should Pay for Access to American Market, Aug 1 p 298
Biehl, John F.:
Apprenticeship Training in Worthington Plant*, Aug 8 p 333
Billings & Spencer Co.:
Drop Hammers, Motor-Driven Rolls*, Oct 17 p 1045
Binks Mfg. Co:
Spray Painting Outfit*, Aug 22 p 473
Blanchard, Edward P.:
Automatic Continuous Manufacturing, July 11 p 109
Blaw-Knox Co.:
Pavegard, for Longer Wearing Street Surface, Aug 15 p 424
Personnel Changes, Sept 12 p 678
To Acquire Union Steel Casting Co., Aug 1 p 299
Boats, Motor:
Steel, Government Built*, Aug 22 p 465
Boilers:
Fatigue Tests*, Sept 5 p 607; Sept 26 p 853
Bolckow, Vaughn & Co., Ltd.:
Merger with Dorman, Long & Co., Ltd., Oct 31 p 1219
Thomas Process Jubilee, Oct 31 p 1216
Bolts and Nuts:
Pacific Coast Steel Co.'s New Plant*, Oct 3 p 913
Bolts, Bearings and Profits (Editorial), Aug 29 p 560
Bolts, Screws and Rivets:
Cold-Heading and Thread Rolling, Oct 17 p 1027
Bonuses:
American Rolling Mill System, Nov 14 p 1319
Group, Incentives, Oct 31 p 1175
Book Reviews:
American Bureau of Metal Statistics Year Book, Sept 12 p 688
American Merchant Marine Problem, Dec 19 p 1707
Chains and Belts for Conveyors, Sept 19 p 742
Commodity Exchanges, Dec 19 p 1706
Continental Wire Making (Draht-Welt-Buch), Sept 12 p 686
Foundry Practice, Sept 12 p 688
German Treatise on Foundry Work, Aug 8 p 384
History of Manufactures in United States, Sept 12 p 687; Dec 19 p 1706
How Surface Damage Affects Fatigue, Nov 7 p 1242
Industrial Economics, Sept 12 p 686
Industrials, Their Securities and Organization, Aug 8 p 384
Manufacturing, Aug 8 p 384
Manufacturing Costs and Accounts, Dec 19 p 1669
Material Control and Storekeeping in Machine Shops and Foundries, Dec 19 p 1707
Mergers and the Law, Nov 7 p 1241
Mergers in Industry, Nov 7 p 1241
Photomicrographs of Iron and Steel, Nov 7 p 1241
Port and Terminal Charges, Dec 19 p 1706
Practical Industrial Furnace Design, Aug 8 p 385
Principles of Metallography, Aug 8 p 385
Principles of Metallurgy, Aug 8 p 384
Principles of Scientific Purchasing, Dec 19 p 1706
Production Planning—Its Engineering Elements, Dec 19 p 1669
Rolling Mill Encyclopedia, Nov 7 p 1243
Soviet Union Looks Ahead, Dec 19 p 1669
Steel and Its Heat Treatment, Aug 8 p 385
Steel for High Temperatures and Pressures, Sept 12 p 687
Story of Baltimore & Ohio Railroad, Nov 7 p 1232
Tariff on Iron and Steel, Dec 19 p 1668
Ten Years of Iron and Steel Industry in Poland, Nov 7 p 1243
Trade Associations, Sept 12 p 688
Books Received, Aug 8 p 385; Sept 12 p 688; Nov 7 p 1243; Dec 19 p 1707
Bopp Steel Corporation:
Organized, Nov 28 p 1458
Boring Head:
Gairing*, Sept 19 p 767
Boring Machine:
Defiance Two-Way Opposed Reaming and*, Dec 12 p 1602
Lucas Horizontal*, Sept 19 p 751
Moline No. 14 Hole Hog Cylinder*, Oct 3 p 907
Root, for Wooden Cable Heads*, July 18 p 162
Universal Horizontal*, Sept 19 p 752
Bossert, T. W.:
Aluminum Alloys in Aeronautics, Sept 26 p 832
Boston and Oxford:
Drilling Tests, Dec 19 p 1705
Boulton & Paul, Ltd.:
Heat Treating Stainless Steel Tubes*, Oct 31 p 1157
Bourne-Fuller Co.:
Merged with Republic, Donner and Central Alloy Steel Companies*, Dec 19 p 1675
Boye & Emmes Machine Tool Co.:
Coneless Engine Lathes*, Nov 21 p 1389
Brace, Dr. P. H.:
New High-Frequency Furnace, Sept 26 p 825
Bradley, Wilson:
Leaching Manganese Ore with Ammonia, Aug 8 p 345 (Editorial) p 359
Brandt Engineering Co.:
Furnace for Bright Annealing, Sept 12 p 683
Brass:
Recovering Scrap, Sept 26 p 831
Vickers High-Strength, Aug 29 p 548
Braune, Hjalmar:
Nitrogen Content in Steel, July 11 p 85
Brazing:
Steel, Failures, Oct 24 p 1103
Brecht and Wahl:
Mechanical Springs*, Dec 19 p 1664
Breuer Electric Mfg. Co.:
Electric Paint Spray*, Nov 14 p 1316
Brewer, Robert W. A.:
Alloy Steels, Past and Present, July 11 p 108

Brewster, William, Co.:
Elkonite Marking Tips, Nov 7 p 1248
Bridges:
Corridor, Polished Allegheny Metal Sheets*, July 18 p 158
Hudson River at Poughkeepsie*, Sept 5 p 606
Liberty, to Be Built Across Narrows, Nov 21 p 1399
Pittsburgh, Selected as Most Beautiful Built in 1928*, Nov 7 p 1231
Tests on Columns of Structural Alloy Steel*, Nov 14 p 1300
Brinton, William C.:
Flexibility Needed in Materials Handling, Dec 12 p 1606
Broaching Machines:
Foote-Burt Surface*, Sept 19 p 756
Broderick Fireside Homes Association:
Steel Frame Houses for South America, July 11 p 121
Brokers' Loans:
Mystery of Increase, Oct 10 p 990
Bronzes, Bearing:
Best Suited to Lack of Lubricant, Aug 1 p 265
Brosius, Edgar E., Inc.:
Welded Grab Bucket*, Nov 28 p 1462
Brown & Sharpe Mfg. Co.:
Micrometer with 0 to 4-in. Range*, Nov 28 p 1462
Plug and Ring Gages*, Nov 21 p 1389
Releasing Die Holder*, Sept 12 p 683
Brown Instrument Co.:
Improved Method of Installing CO_2 Meters*, July 18 p 164
Brown, J. L.:
Roller Bearings on Old Mill Motors*, Sept 12 p 677
Brush:
Paasche Wire*, July 18 p 163
Bryant Chucking Grinder Co.:
Deep-Hole Automatic Sizing Grinder*, Sept 19 p 759
Bucket:
Brosius Welded Grab*, Nov 28 p 1462
Erie Multi-Power*, July 18 p 163
Williams 10-Ton Clamshell*, Aug 1 p 274
Budd, Edward G., Mfg. Co.:
Flash Welding Steel Automobile Bodies*, Nov 14 p 1303
Buffalo Bolt Co.:
Simplification Exhibit*, July 18 p 156
Buffalo Forge Co.:
16-In. Sensitive Drill*, Aug 8 p 353
Bending Rolls*, Sept 19 p 770
Buffing Machine:
Hisey-Wolf Dual, with Independent Spindle Control, July 25 p 223
Buffington, E. J.:
Chicago's Expansion in Steel Production, Oct 17 p 1079
Building:
(See Also Construction)
Better Situation Foreseen (Editorial), Nov 14 p 1325
Contracts, June, p 131; July, p 485; August, p 778; September, October, p 1481; November, p 1715
Prolonged Activity (Editorial, Oct 17 p 1056
Revised New York Code May Allow Welding, Oct 3 p 935
Bundling Machine:
Garrett Scrap*, Aug 8 p 353
Bunnell, Sterling H.:
Material Handling in Chilean Nitrate Plant*, Sept 12 p 667
Bureau of Foreign and Domestic Commerce:
Cooper, William L., Head, Sept 19 p 777
Bureau of Standards:
Bend Test Machine, Sept 12 p 672
Polishing Machine for Metal Specimens, Nov 14 p 1312
Burgess, Robert W.:
Size of Organization, Dec 12 p 1599
Burlingame, Luther D.:
Making Machine Tools Safe, Oct 3 p 895
Burnisher:
City Gear*, July 18 p 163
Bus Bodies:
Steel, Manufacture in Lang Plant*, Dec 26 p 1732
Business:
Analysis and Forecasts, Sept 19 p 773; Oct 17 p 1034; Nov 21 p 1372; Dec 19 p 1673
And the "New Era" (Editorial), Nov 21 p 1396
Big, Danger in Growing Bigness of, Sept 19 p 784
Circles and Spirals in (Editorial), Sept 19 p 784
Effect of Stock Market on (Editorial), Nov 21 p 1396
General (Editorial), Oct 17 p 1054
Hoover Conferences on Stabilization, Nov 21 p 1391; Nov 28 p 1455, (Editorials) pp 1466, 1467; Dec 12 p 1608; Dec 19 p 1672; Dec 26 p 1765
Hoover Committee on Stabilization, Dec 19 p 1672; Dec 26 p 1765
New Trends in Distribution, Nov 28 p 1443
Outlook, Charles M. Schwab on, Dec 12 p 1610
Prospect for 1930, Nov 28 p 1449
Size and Success (Editorial), Aug 8 p 358
Status Quo of (Editorial), Dec 5 p 1538
Survey Reveals Good Conditions, Oct 17 p 1056
Trends, Discussed by Industrial Engineers, Oct 31 p 1179

Contemplating Tin Plate Mill, Nov 14 p 1337
Canton Rolling Mills Corporation:
To Make Coated Alloy Sheets, Oct 31 p 1216
Capacity:
Fabricated Steel, Distribution and, 1928, Nov 21 p 1380
Steel Plant, by Districts, July 4 p 36
Capital:
Prospects for Exports of (Editorial), Nov 21 p 1398
Car Axles:
Reclaiming, Nov 28 p 1438
Carboloy:
(See Tungsten Carbide)
Carborundum Co.:
Lapping Soft and Hardened Gears, July 11 p 99
Carburizing:
Rifle Parts*, Nov 28 p 1435
Carnegie Steel Co.:
33 and 36-in. Beam and Girder Sections, Sept 12 p 637
Carrie Furnace Lost-Time Accident Record, Dec 26 p 1737
To Add 10-in. Bar Mill at McDonald Works, Dec 5 p 1536
Carrier Engineering Co.:
Manufacture of Centrifugal Compressors*, Oct 3 p 897
Cars:
For Shipping Automobile Bodies*, July 11 p 88
Freight, Record Traffic with Less Equipment, Oct 24 p 1142
Steel Box on Rubber Tires*, Oct 17 p 1036
Cartels:
Continental Thin Sheet Proposed, July 25 p 253
International Sales Planned, Nov 21 p 1422
Carter, L. R., Co.:
Acquired by Stanley Works, Dec 26 p 1766
Castings:
Sherman Core Treatment for*, Dec 26 p 1736
Castings, Aluminum Alloy:
Equal to Die Castings*, Dec 26 p 1722
Casting, Centrifugal:
Guns, Oct 24 p 1106

Casting Machine:
For Chilled Steel Balls*, Aug 8 p 350
Castings, Alloy Steel:
Production, 1909-1928*, Aug 29 p 544
Castings, Bronze:
Porosity in, July 18 p 164
Castings, Copper:
Deoxidized with Beryllium, Oct 3 p 911
Castings, Iron:
Alloy, Ascendency of, Aug 1 p 282
Alloy, Output, 1928, Aug 1 p 282
As Engineering Material, Symposium on*, July 4 p 6
Chromium, Manganese and Nickel Alloy, July 4 p 16
Correlation of Test Bar with, July 4 p 15
Effect of Phosphorus on Graphite in*, Dec 5 p 1518
Heat Treatment of, Sept 26 p 826
High-Test, Possibilities, Oct 24 p 1101
Made in Brackelsburg Furnace, Dec 12 p 1586
Molybdenum in*, Dec 5 p 1507
Ram-Up Cores for*, Aug 8 p 346
Rejuvenation Planned, Nov 14 p 1321
Remedy for Enamel Blisters, Nov 21 p 1398
Size of Section and Strength of, July 11 p 80
"Slush Molding," Oct 24 p 1096
Solution in Acids, Nov 28 p 1445
Superheating, Sept 12 p 674
Test Bars for, Nov 28 p 1438
Unmachinable Caused by Fins*, Nov 28 p 1446
Uses for, Sept 19 p 776
Various Types, Oct 31 p 1174
Castings Malleable:
Made in Brackelsburg Furnace, Dec 12 p 1586
Production by Months, June, p 226; July, p 586; August, p 861; September, p 1079; October, p 1555
Production in Fort Pitt Plant*, Nov 21 p 1364
Short-Cycle Annealing Process, Sept 19 p 776
Castings, Steel:
240,000-lb. Anvil*, Aug 15 p 398
In Water-Cooled Copper Ingot Mold, July 11 p 109
Orders, June, p 248; July, p 584; August, p 984; September, p 1284; October, p 1486
Production Control in Sivyer Plant*, Oct 17 p 1029
Cement, Portland:
Production, July, August, p 780; September, p 1145; October, p 1481; November, p 1715
Census of Distribution:

ESTABLISHED 1855

VOL. 124, No. 1

Mass Production Methods Used in Airplane Plant

BY BURNHAM FINNEY*

EMPLOYING mass production methods similar to those long used in the automobile industry, the Waco Aircraft Co., Troy, Ohio, has recently put into operation a new plant which is now turning out more than six fuselages a day and which has the capacity for manufacturing ten or more a day.

Since the founding of the company in 1921, it has specialized in building three-place open cockpit commercial types of airplanes. The basic model has always been so designed as to allow for additional improvements and refinements without attempting to create yearly models. This method has permitted rapid adoption of new ideas and quantity production of service parts.

Models now being built are the "90," with 90-hp. "OX-5" motor; the "150," with Hisso 150-hp. motor; the "180," with Hisso 180-hp. motor; the "165" Straight-Wing, with 165-hp. Wright Whirlwind motor (five-cylinder); the "220" Straight-Wing, with 220-hp. Wright Whirlwind motor (nine-cylinder); the "220" Taper-Wing, with 220-hp. Wright Whirlwind motor (nine-cylinder); and the "300" Taper-Wing, with 300-hp. Wright Whirlwind motor (nine-cylinder). The Taper-Wing sport models are powered with either the 220-hp. or 300-hp. Wright Whirlwind motor (nine-cylinder).

Comprising eight buildings, the new plant has approximately 100,000 sq. ft. of floor space, of which 80,000 sq. ft. is in the main manufacturing building. Other structures consist of the office and administration building, heat and power plant, acetylene generator building, paint and oil storage building, repair hangar, sales department hangar and cafeteria. Adjoining the plant is the company's airport, which is of sufficient size to accommodate or test the largest planes. It has two runways, each of which is 3000 ft. long. One runway is 1300 ft. wide and the other 400 ft.

The main manufacturing building is of monitor-type construction and is exceptionally free from supporting columns, thereby affording excellent natural light and ventilation. The walls and flooring are concrete and the columns, trusses and sashes, steel. Rough actinic glass is used throughout to minimize heat and sun glare. Fire protection is afforded by an automatic sprinkler system, with an additional automatic deluge system in paint spray booths. A 75,000-gal. tank tower provides a source of water auxiliary to the city water system.

Stockroom Centrally Located

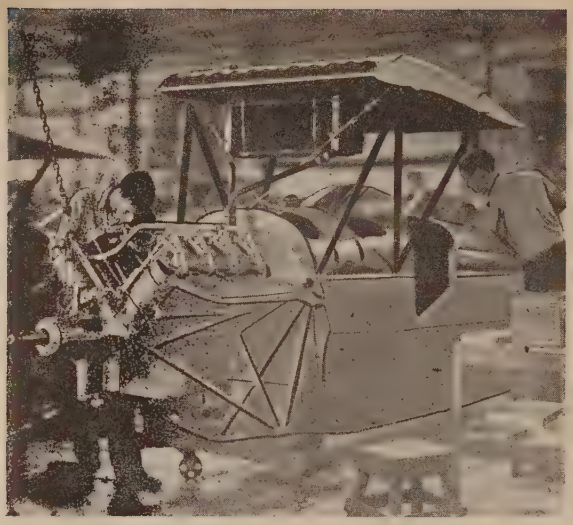
In the center of the building is a large rectangular stockroom, from which parts and raw materials go out to the sub-assembly and final assembly departments. Occupying one complete section of the building are woodworking, wing-rib assembly and wing assembly departments. Running the length of one side of the plant are the machine shop, sheet metal shop, fuselage and tail surface assembly jigs, welding jigs, motor and propeller sections, and sand-blast room.

All metal parts, such as cockpit cowlings, motor cowlings, instrument boards and spinners, are cut out and fitted to master molds in the metal department to insure uniformity of fit and to provide for interchangeability of parts for each airplane of a specified model. Rough edges are curled over a metal wire shaper, which acts as a stiffener for the beading. Thus, no sharp or serrated edges are allowed to come in contact with the pilot or passengers of a plane.

The cockpit cowling is drilled at close intervals around the upper edge, and through these holes are fastened the thickly padded, upholstered leather beading. Streamline metal covers for the oleo strut are cut out and constructed in the metal department.

Wherever a bolt attaches entirely through a wooden member, a steel plate is used to cover both ends of the bolt hole, thereby increasing its strength. Brace wires, for instance, are connected with jutted wings, which are an integral part of such a steel plate. This method has been

*THE IRON AGE, New York.



Fuselage Finished to Cockpit Covering, Motor Fairings and Gas Tank

substituted for washers wherever they have shown a tendency to grind themselves into the wood. All internal fittings, such as brace wires, bolts, screws, nuts, plates and control members, are cadmium-plated to prevent rust. Incidentally, all metal parts and fittings are tested and inspected according to military standards.

Close Attention to Detail in Rib Construction

In the construction of taper wings, tubular steel members of an ingenious design are added for interior bracing. They account, in part, for the sheer maneuverability of this type of wing. By the use of jigs of special design, wing ribs are rapidly fabricated by operators who specialize on this one operation. Stock for this purpose is prepared in the woodworking department and is conveyed to the jig, where it is placed in a group of small compartments close to the operator. With glue and a sufficient quantity of brads at his side, the operator quickly assembles the wing ribs. Jigs are constructed of steel blanks mounted on a solid steel plate, this structure being bolted to a rigid wood and steel unit waist high to the operator. This rigid set-up makes possible a uniformity of construction in each wing-rib.

The rib is built in the manner of a truss design with two long members of spruce, to which are attached five shorter members of spruce at proper cross-sections. At each intersection of the main and cross members, plywood plates are attached with brads. Following the custom of bridge engineering, these plywood plates are triangular in shape and attach equally to three points of the rib. Each brad is so placed as to strengthen and bind a member without causing splits or fractures.

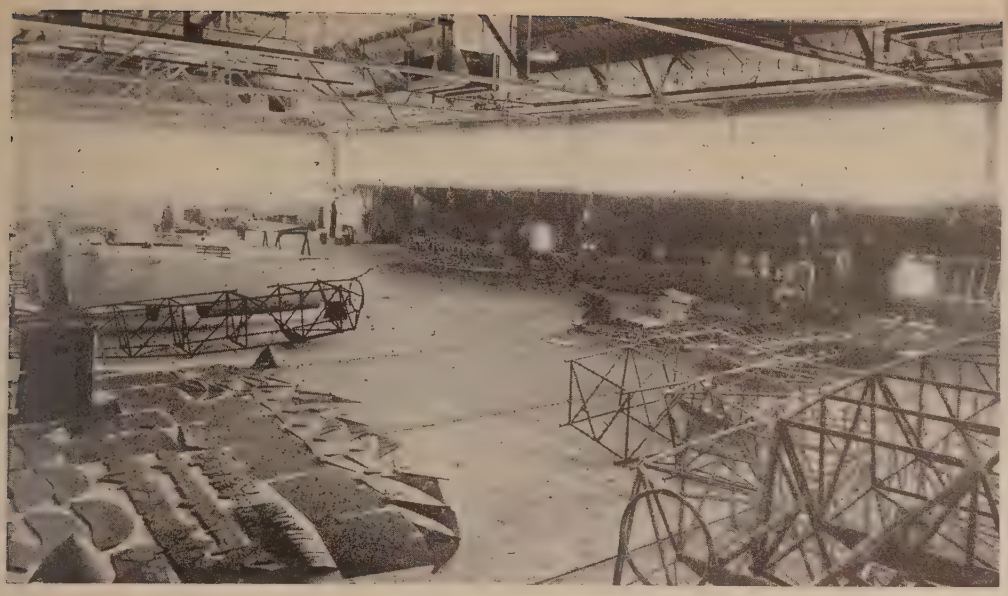
Over 200 brads are used in connecting plywood plates in the wing-rib assembly. The brads are of special design and weight and are cement-coated and diamond-tipped. In addition to the cement coating, several ferruled serrations are added to the shank. Together they act as preventives to loosening or pulling out. Twenty triangular plates of plywood are employed in the wing rib. Each member is glued in place before the brads are inserted. When dried, wing ribs are thoroughly buffed to remove sharp corners and rough edges. Ailerons are constructed in separate jigs with a similar accuracy in detail.

Finished ribs and ailerons are carried to the main wing assembly department, where ribs are attached to the wing spars. The latter are of first-grade, clear-grained spruce. Specifications call for first-cut stock, not routed stock, and no latitudes are allowed.

Six long ribs are first attached to the spars and then six shorter ribs, with which are connected the ailerons. As each rib is set in place, it is nailed to the wing spar. To prevent its sliding or shifting, it is wedged in place by plywood buttresses at each side, the top and the bottom. These buttresses also are nailed in place. The wing-walk is next added, and then tie rods and ailerons. The curved bow is attached to the wing end, the leading and trailing edges are set in place, and finally the dural intermediate nose ribs are added. The trailing edge is of double-coppered steel plate.

Fitted with wiring attachments and tubular aileron controls, wings pass final inspection and are conveyed to

At Final Assembly Line Wings Are Rigged and Final Check Is Made of All Parts and Controls



Paint Department, Showing Wing Being Sprayed in Spray Booth in Background

the paint room to be sprayed with varnish as a preservative from moisture. The wing fabric is attached when the varnish is dry. The fabric is rib-sewed to a strip of reinforcing tape running completely around the rib contour.

Wings then return to the paint room to receive a number of coats of "dope" until sufficient tautness is obtained, when spray guns give them several finish coats of lacquer. From this point wings pass to the final assembly line for rigging and lining up to the fuselage. Tail surfaces, center section and fuselage fabric covers are treated in the same manner as wings.

Tubing Stockroom Adjoins Machine Shop

In the metal shop are constructed the oleo struts used in the landing gear, propeller guards and spinners, pilot's and passengers' seats, fuselage, deck covers, cockpit cowlings, engine cowlings, instrument boards, wing and motor inspection plates, gas tanks, radiator shutters, crankcase covers, exhaust stacks, fire-walls, fairings and other special metal parts. All small parts, such as wing and aileron hinges and braces, are manufactured in the company's machine shop. Here the metal tubing for fuselage and tail-surface control assemblies is specially milled on a radius to give it a curve-out instead of a sheer cut. This permits each tube to fit snugly against the next member so that the welding operation covers the surface of both members without having any crevices to fill. Certain tube sections are spline-cut in addition to having the milling operation. They are used wherever more than two members are to be joined and welded. For the convenience of the machine operators, a storeroom for rough tubing is maintained close to the machine shop. After being machined, tubular members are placed in compartments near the operators of the fuselage and tail surface assembly jigs.

Side-wall members of the fuselage are fabricated and welded in three operations. The first operation is for the cockpit sections, the second for the motor and gas tank, and the third for the tail surface. Because each of these sections performs different functions in flight and has separate weight-carrying abilities and stresses, they are constructed of tubing of different gages. After the side-walls have been fabricated and welded, they are placed in a box jig, where the cross members are fitted and welded. Tail surface members are fabricated and welded in separate jigs designed for that purpose. Three separately-constructed box-like structures are then joined and welded in a larger jig, and the fuselage is complete. Gas for welding is piped to each jig from a central source and is available for the operator at the turn of a valve.

Assembly Line for Fuselage

The motor mounting is drilled and the holes are fitted with metal bosses. The fuselage and tail surfaces are conveyed to the sand-blast room, where they receive treatment similar to the etching of propellers. Immediately after this operation they are inspected and tested and are taken to the paint department to be sprayed with paint. From the paint department the fuselage goes to the assembly line and the tail surfaces to the covering section to receive their fabric cover.

In the assembly line the fuselage receives the floorboard seats, gas and oil tanks, stick, rudder, tubular control members, tail skid, instrument boards, safety belts, upholstering and doors. The gas tank is hung on steel wire cables and is bound in the same manner. To prevent chafing and slipping the cables are attached over heavy felt padding. The control tubing extends from the fuselage to the tail and to prevent binding in operation is

Three Separately Constructed Box-Like Structures Being Joined and Welded in Large Jig, Completing Fuselage

Assembly Line, Looking Down Main Aisle

carried through fiber tubes larger in diameter than the control tubes. The fiber tubes are greased and are so situated as to be inspected, replaced or greased quickly.

Specially designed blocks of wood are taped to the fuselage at intervals. They serve for the use of screws or bolts in attaching the members described above, and also to preserve the metal tubing from weakening through the introduction of screw or bolt holes.

After the fire-walls, fairings and special attachments have been added, the fuselage is ready for the skeleton frame to which is fitted the fabric cover. This cover receives the same treatment of "doping" and painting as the wing fabrics. The painted fuselage is then returned to the motor department, where the motor is added. Here also are attached the laced cockpit padding, windshields, instruments, motor cowlings, tail surfaces, center wing section, spinner and prop, oleo struts, landing gear (certain models are equipped with brakes), and fuselage striping.

In view of the fact that motors of various kinds are used, several arrangements have been made for mounting them. In the case of the OX-5 motor, the mounting is on braced tubular arms welded to the main fuselage section, the arms being drilled at regular intervals and fitted with steel bosses. Wright Whirlwind motors are similarly mounted on circular braced steel tubing.

Planes Subjected to Rigid Tests

At the final assembly line the wings are rigged and lined up and a final check of all parts and controls is made. The plane then is rolled to the field about 50 yd. distant for a test flight. Each plane is flight-tested before delivery. The performance of the engine is first tested on the ground, and notations are made accordingly. All instruments are checked to see that they are functioning properly. The plane is checked for take-off, landing and stability in the air and is put through a series of maneuvers to check the performance. After landing, it is inspected for oil or fuel leaks. The test pilot certifies to its air-worthiness.

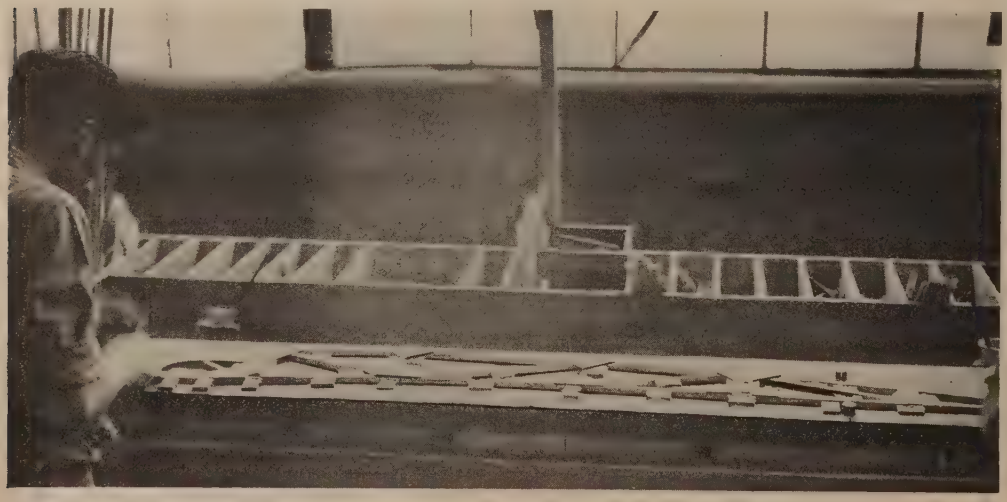
The fuselage and tail surfaces, as well as the landing gear "Vs," are made of S.A.E. No. 1025 mild carbon steel tubing, which is readily welded and which gives a better strength-weight ratio than S.A.E. No. 1020 low-carbon steel. It is less expensive than S.A.E. No. 4130 chrome molybdenum steel and can be purchased in large shipments without delay. Chrome molybdenum steel, however, is used for the axles of the planes, because they are subjected to high bending stresses.

Instrument panels, wheel disks, cowling, baggage compartment doors, inspection doors, seats, spinners and head streamline are constructed of aluminum, which also is employed in many other places where lightness of weight is a major consideration. The degree of hardness of the aluminum used in various parts is determined by the bends and the stiffness required.

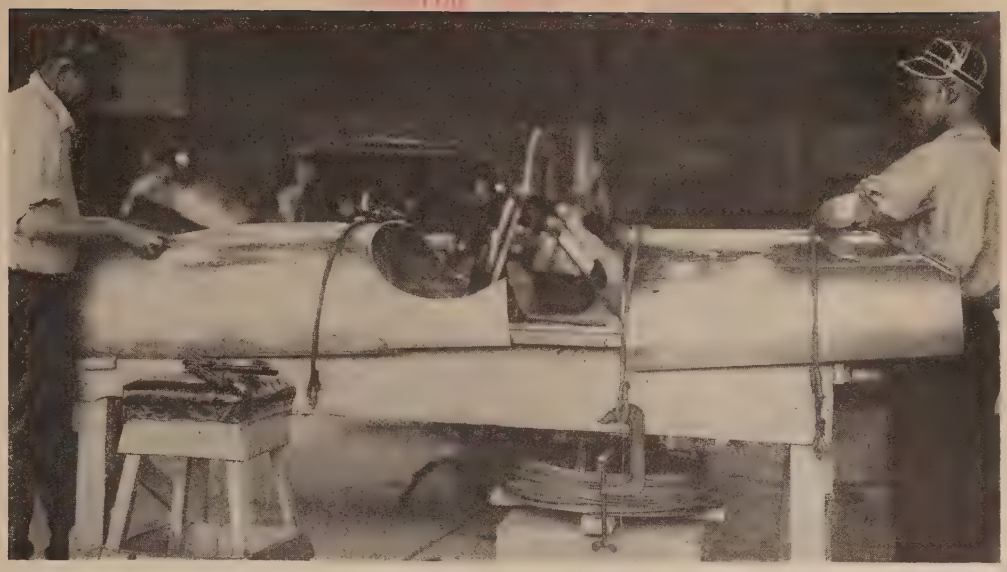
Wings Edged with Duralumin

For the leading edge of the wings to support the fabric between the ribs in the tapered wing model, duralumin is used. This material has been given the preference over aluminum in certain places where considerable stiffness and strength are necessary.

Fire-walls and fuel tanks are made of terne plate,



Cockpit Cowling Being Cut Out and Fitted to Master Mold



Sidewalls of Fuselage, Placed in Box-Like Jig, with Cross Members Being Welded

which may readily be soldered. This is especially advantageous in the case of fuel and oil tanks. The low melting point of aluminum precludes its use for fire-walls. Fittings are made almost entirely of S.A.E. No. 1025 mild carbon steel. Wherever high physical properties are required chrome molybdenum steel is used.

Plant Served by Spur Railroad Track

The plant is served by a spur track of the Big Four railroad. This track, suppressed to the floor level, extends through 200 ft. of heated shipping and receiving sections of the main manufacturing building, affording protection to materials in inclement weather. Electric hoists have been installed at one end of the platform to facilitate the transfer of material to railroad cars or to motor trucks, which also are loaded at this point.

From its inception in 1921 the Waco Aircraft Co., until recently known as the Advance Aircraft Co., has built an airplane in which the attainment of high aerodynamical ability at an economical cost for commercial purposes has been stressed. The founder of the company, Clayton J. Bruckner, is president and chief engineer. Heading the administrative division, as vice-president and general manager, is Lee N. Brutus.

By Use of Jigs of Special Design, Wing Ribs Are Rapidly Fabricated by Operators Specializing on This Operation

Cast Iron as Engineering Material

Testing Society Stages Symposium to Demonstrate Many Advantageous Qualities—How Test Bars May Represent Casting—Impact, Wear and Heat Treatment

WITH the object of calling the attention of engineers to the many excellent physical properties of cast iron, a symposium was arranged for the thirty-second annual meeting of the American Society for Testing Materials at Atlantic City, last week, June 24 to 28. The symposium was comprehensive and was made up of brief papers dealing with various phases of this broad field. It was organized by committee A-3 on cast iron. A large attendance revealed the keen interest in the subject.

An introduction to the symposium was presented by H. Bornstein, director of laboratories, Deere & Co., Moline, Ill., and chairman of the committee. There has not been the same progress in the classification of cast irons as there has been in steels and also in the determination of their physical properties, said Mr. Bornstein. Accurate information as to cast iron has not been widely disseminated to the engineering profession. Therefore some suspicion has arisen as to the value of such iron as an engineering material. Considerable progress has been made in cast iron metallurgy and irons of high physical properties are now available. Specifications have not kept abreast of practice. Cast iron is a reliable engineering material and knowledge as to its properties is necessary to encourage its proper use in industry.

The purpose of committee A-3, said Mr. Bornstein, has been to assemble a group of papers outlining the classification of physical properties of cast irons, according to a plan formulated a year ago. The presentation is realized as far from complete. Only a beginning has been made.

How Gray Irons Should Be Classified

IT is necessary to classify gray irons before an intelligent general study can be undertaken, said J. W. Bolton, chief chemist and metallurgist, Lunkenheimer Co., Cincinnati, who introduced the symposium and took as his subject "Classification of Gray Iron Alloys." The most logical classification seems a primary one according to causative factors. These are:

1. Chemical composition—initial, incidental and final.
2. Structural and mechanical makeup of charge.
3. Melting process.
4. Thermal and mechanical history—furnace spout to cooled casting.
5. Design and workmanship.

Mr. Bolton advocates a primary classification based on chemical analysis and a secondary one upon cooling rate. He shows how a mathematical formula can be applied to determine relative cooling rates of simple shapes. His chemical classification is divided into four groups of eight subdivisions each, based on the carbon and silicon contents respectively.

Section and Composition Affect Properties

THE question of the effect of section and various compositions on the physical properties of cast iron was discussed by R. S. MacPherran, chief chemist, Allis-Chalmers Mfg. Co., West Allis, Wis. The author's tests were conducted with a threefold object: To determine the effect of increased section on the tensile strength of cast iron; second, to determine the effect on hardness of the removal of various amounts of stock; and third, to determine if the high-test iron followed the same laws as the weaker grades. His conclusions were as follows:

> The effect of increasing the section of certain types is to materially and progressively lower the tensile strength.
>
> Removal of extra stock in these types is progressively accompanied by loss of hardness.
>
> Under cooling conditions similar to those described in the paper, the high-test iron reported on has practically equal Brinell hardness throughout the section.
>
> The grain of the high-test iron is somewhat more open as the center of the casting is approached.
>
> The tensile strength of the high-test iron tends to fall off as the section is increased or as the cooling is retarded, though not to the extent shown by the other two types.

Correlating the Test Bar with the Casting

THAT the test bar does not represent the casting is generally acknowledged in the case of gray iron. An attempt to correlate cast iron test bars and castings was made in a paper by W. H. Rother and V. M. Mazurie, metallurgist and assistant metallurgist respectively, Buffalo Foundry & Machine Co., Buffalo.

The authors report briefly on the work undertaken by various investigators and state that few really tangible facts have been established. Investigators agree that more than one size of test bar is necessary where any account is to be taken of the variation of strength with thickness. Cast iron, as produced in the modern foundry, is really a series of alloys and any attempt at a correlation of test bar with casting is futile unless this fact is recognized.

Through a proper interpretation of the cooling rate of iron it is felt by the authors that the physical properties of a test bar can be correlated with the properties of the casting. This does not imply that a single size will be applicable in every case. It is believed that specifications in the future will cover test bars of every size and that, with an intelligent choice of test bar, the properties of the casting will be predicted accurately from the properties of the test bar.

Strength of Plain and Alloy Iron

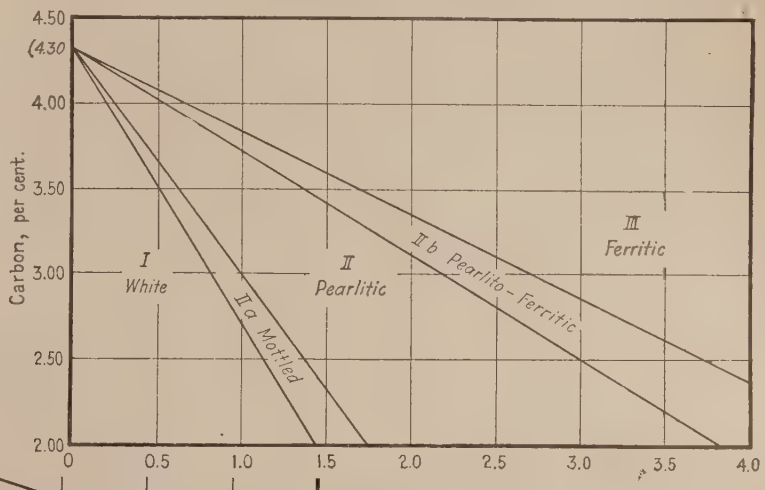
ANOTHER contribution to the symposium was entitled, "Static Strength of Plain and Alloy Cast Iron," by F. B. Coyle, research metallurgist, International Nickel Co., New York. In the opinion of Mr. Coyle the only tests for strength of cast iron which are really absolute are those for tension and compression. His contribution presents data covering the tensile strength only of cast iron. He starts with the Maurer diagram which shows the relation between structure and composition and presents a series of diagrams, some of which are reproduced herewith, showing an extension of the range of composition, which will produce a pearlitic structure and maximum strength. The elements, nickel and chromium, are used as examples of alloy iron. These diagrams should not be considered, says the author, a sole criterion

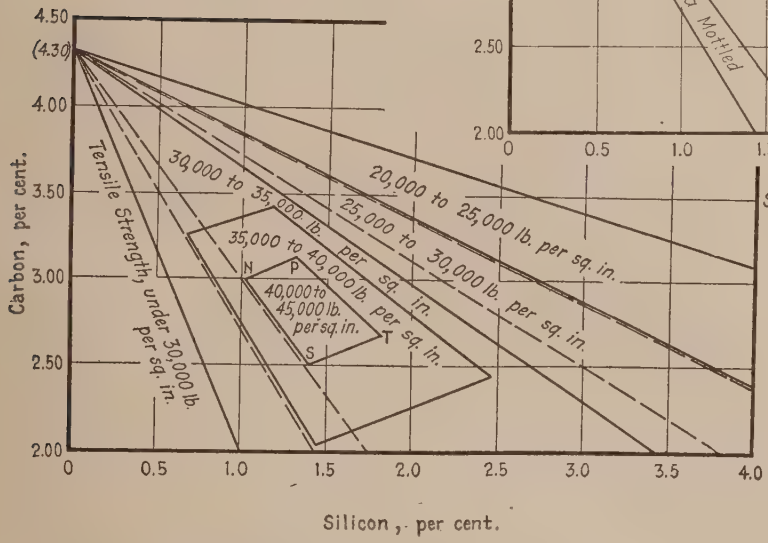
on the production of castings. Other practical modifying characteristics, such as hardness and tendency to chill, should be taken into account as well as strength, in the production of suitable castings.

Cast Iron Has Elastic and Fatigue Properties

ELASTIC properties of cast iron were interestingly discussed by J. T. McKenzie, chief chemist, American Cast Iron Pipe Co., Birmingham. Elasticity is that property of a body which enables it to return to its former shape after undergoing strain, and the modulus of elasticity, in tension or compression is the quotient of stress divided by linear strength.

MAURER'S Constitutional Diagram (Right) of Cast Iron (F. B. Coyle's Paper on Static Strength of Cast Irons





CAST Iron's Constitutional and Strength Diagram (Left) as Conceived by F. B. Coyle in His Paper on Static Strength of Plain and Alloy Iron

When applied under clearly defined conditions, the modulus of elasticity is one of the most useful indications of the quality of cast iron. It is very closely related to the analysis when cooling conditions are uniform and therefore is a good index of the casting properties of the iron. The results of some of the author's work on this problem are presented by tables and charts in the paper, one of which is here reproduced.

Another of the engineering characteristics of cast iron included in the symposium was the fatigue properties. This problem was discussed by J. B. Kommers, professor of mechanics, University of Wisconsin, Madison, Wis. His contribution, "Fatigue Properties of Cast Iron," reports the results obtained in casting four lots of cast iron at the University of Illinois and 10 different cast irons at the University of Wisconsin.

In the first case, the fatigue strength of cast iron was found to be markedly increased by oft-repeated strength below the endurance limit. Grooves in cast iron test specimens reduced the endurance limit only a small amount. At elevated temperatures there was found to be no great reduction in the fatigue, tension, and Brinell hardness tests up to a temperature of about 800 deg. Fahr. In the other tests, the materials used ranged from low-strength to high-strength cast irons and the ratio of endurance limit to tensile strength showed an average value of 0.49 and the ratio of endurance limit to modulus of rupture showed an average value of 0.26.

Testing Cast Iron for Impact and Wear Resistance

ENGINEERS in general are interested in the impact resistance value of cast iron, particularly in the case of water pipe. A contribution to this phase of the symposium was made by H. Bornstein in a brief paper entitled "Impact Testing of Cast Iron."

There is no standard test or method for measuring the resistance to impact of cast iron, said Mr. Bornstein, although several methods have been proposed. There is need for a standard method of test. The results of most of the proposed methods are not in general agreement. It is the consensus of opinion, however, that irons high in static strength are also high in impact value. In many cases the shock or impact test is of greater value in predicting results in service than are static tests, particularly where the casting is to be subjected to shock.

Another property of cast iron for which there is no general agreement among investigators as to the best method of testing is wear resistance. They not only do not agree as to test methods but there are also differences of opinion regarding the influence of various elements in cast iron upon resistance to wear. "Wear Testing of Cast Iron" was discussed by A. L. Boegehold, metallurgist, General Motors Research Laboratories, Detroit. As to wear testing in the case of cast iron automobile engine cylinder blocks, the author describes a method of test which he uses. He discusses the difficulties encountered in trying to conduct a test for wear when a lubricant is present. That the kind of cylinder iron used has no influence upon the result because of good lubrication be-

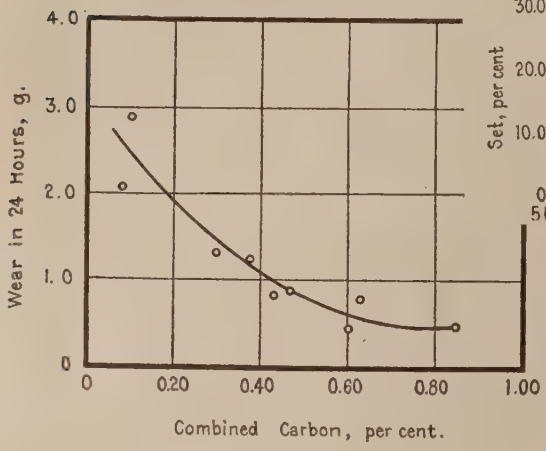
tween the piston and the cylinder is demonstrated by a brief description of a wear test conducted on an automobile engine constructed of individual cylinders of four different kinds of cast iron after running 20,000 miles.

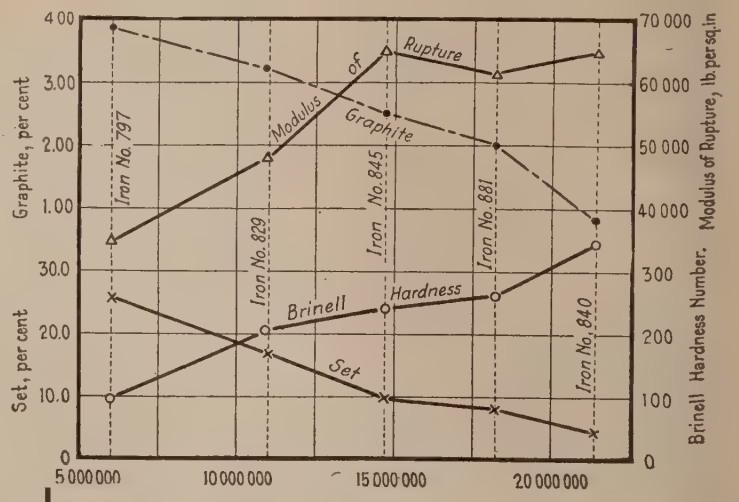
Mr. Boegehold declares that a universal wear test is undesirable but that laboratory wear tests in which service conditions are imitated give valuable data. When lubricants are present, a wear test is difficult. The largest factors in cylinder wear are stated to be grit and lack of lubrication. It is recommended that investigators of cast iron wear should have a comprehensive knowledge of cast iron.

The greatest resistance to wear is to be found in cast irons containing about 0.75 per cent combined carbon in sand-cast gray iron, according to the results of a series of tests and as shown by one of the charts here reproduced.

VALUES for Plastic Deformation (Set) in Six Repeated Loadings to Three-Fourths Ultimate Strength Plotted (Right) Against Ultimate Modulus of Elasticity with Trend of Strength, Hardness and Graphite Indicated (MacKenzie)

Influence of Combined Carbon on Wear (Boegehold)





Corrosion and Heat Treatment

IN the majority of cases studied, cast iron is slightly superior to steel or wrought iron in corrosion-resistance in the atmosphere, says H. O. Forrest in a contribution to the symposium entitled "Corrosion of Cast Iron." The author is director of the research laboratory of applied chemistry, Massachusetts Institute of Technology, Cambridge, Mass. Corrosion tests in soils point to the fact that in general the nature of the soil rather than the types of metal of certain classes is the factor governing the rate of corrosion. There are many cases in which cast iron is superior to other ferrous metals as in the handling of various chemical materials.

In general, factors affecting the corrosion of cast iron include not only the characteristics of the metal itself, but also, to a greater extent, the composition of the corroding medium and the type of protective coating employed. There is a need for the use of a proper protective coating before pipe is put into service or else for treatment of the corroding medium with chemicals to bring about the precipitation of protective scales or films.

Heat treatment of cast iron is comparatively a new subject. One of the commendable undertakings of committee A-3 is an extensive digest of the literature of the heat treatement of cast iron now being prepared.

F. B. Coyle discussed this subject briefly, dwelling upon some of the important features involved. If alloying elements can produce considerable increase in the relative values of properties of steel, it is inferred that alloying elements should produce a like improvement in cast iron. This seems true because cast iron is essentially a steel whose continuity is broken up by free graphite. The intrinsic value of alloy steel is only brought out by heat treatment and it is reasonable to assume that cast iron in general should also be benefited by heat-treating processes.

Mr. Coyle states that there are four important factors to be considered in subjecting cast iron to heat: Artificial aging, alteration of chemical and physical properties, growth, and rustproofing. These factors are considered by the author at three different ranges of temperature for heat treatment. The author believes that systematic investigation in this field of study will disclose that the applicability of heat treatment to cast iron will be of distinct economic value to industry in general.

Views in General

SOME disappointment was evident from the fact that the symposium did not bring out a broad range of discussion. The length of the program militated to some extent against this. Mr. Bornstein emphasized the need of knowledge as to machinability and wear of gray iron and the desirability of some measure of these properties. Dr. Richard Moldenke said that all those interested in cast iron want wear and machinability in the product but one great difficulty is the fact that so "many kinds of castings are poured from one mixture. American practice is far behind Europe in this respect."

Alloys Are Not Cure-Alls

Mr. Coyle called attention to the fact that addition of alloys to cast iron do increase the resistance to wear and that his files show many special results of this kind. It is, of course, often necessary to use different mixtures, but alloying elements are not cure-alls but are a great aid for certain purposes. N. L. Mochel offered two valuable illustrated discussions, one on the question of the correlation of test bars and castings, showing some results which he had obtained. He also expressed regret that the symposium did not include the welding properties of cast iron on which he had done some work. Some of his results were interestingly presented.

Testing Society's Largest Meeting

Membership at Record High—New Standing Committees Bring Total to 48—Marburg Lecture a Feature —Research Inaugurated

ADDING still more prestige to an already enviable record, the American Society for Testing Materials held the largest convention in its history last week. It was the thirty-second annual gathering, held in the traditional place, Atlantic City, June 24 to 28. This location has become so fixed a policy that attempts to break away from it have not been very successful. French Lick, Ind., was the place two years ago. Plans were seriously debated last week of holding one convention every three years elsewhere, probably in the Middle West. Chicago is being considered for 1930. As in the recent past the Chalfonte-Haddon Hall was its headquarters.

Unusual activity marked the work of the very many committees. The zeal and earnestness of these committees is always keen and can be matched by no other society in the world. Starting in early Monday, June 24, there were sessions of committees morning, afternoon and evening and much was accomplished. Each year also witnesses new committees formed and new fields entered for fact-finding or specification purposes.

New high records in attendances were made. The total registration by Wednesady evening of 850 men and 245 women had surpassed all figures for the third day. Final registration totals gave 934 men. This compared with 895 men last year. The previous high record was 905 in 1926.

Marked Progress Reported by Executive Committee

A REVIEW of the progress and aims of the society is contained in the annual report of the executive committee which was presented by Secretary-Treasurer C. L. Warwick at the annual meeting. Some of its important features are as follows:

New Standing Committees Organized

Three new standing committees have been organized within the year: Committee A-10 on iron-chromium, iron-chromium-nickel and related alloys; committee B-5 on copper and copper alloys, cast and wrought, and committee B-7 on light metals and alloys, cast and wrought.

Committee A-10 has had assigned to it a most important group of alloys, in which there is much need of coordinated research on the corrosion resistance and other properties of these alloys. In the organization of this committee it has been necessary to consider the relationship of its field of work to that of committee B-4, originally entitled "metalic materials for electrical heating," which deals with a portion of the alloys in the iron-chromium-nickel system, used especially for electrical heating purposes. Some conflict has developed between the two committees as to their relative jurisdiction. At a meeting of committee A-10 last week a settlement of this controversy was put up to the executive committee of the society. The temporary organization of committee A-10 was voted to continue until the regular time for election of officers. Jerome Strauss continues as temporary chairman, with N. L. Mochel as temporary secretary.

The organization of the new committees B-5 and B-7 is part of a reorganization of committee activities in the non-ferrous metals group, which has come about through recommendation made by committee B-2 on non-ferrous metals and alloys.

After a careful study of the standardization activities of the society, particularly from the administrative viewpoint, and in consultation with the standardizing committees through committee E-5, the executive committee has authorized the organization of a new committee to be known as committee E-10 on standards. It is believed that the new committee will develop into a most important administrative one, particularly with respect to the problem of extending the society's standardization work over the entire field of engineering materials and the relationship of standardization activities with those of other bodies.

Corrosion Work to be Coordinated

A coordinating committee on corrosion has been formed to correlate the corrosion studies of the four committees of the society that are dealing with this important subject as applied to different groups of materials, namely, committee A-5 on corrosion of iron and steel; A-10 iron-chromium, iron-chromium-nickel and related alloys; B-3 on corrosion of non-ferrous metals and alloys, and B-4 on high temperature electric resistance alloys. Each committee has appointed two representatives on the coordinating committee.

With these new organizations the number of standing committees is brought to 48.

Executive Committee Enlarged

Preliminary modifications of the by-laws involve an increase in the number of members of the executive committee from 8 to 10, which, with the four officers and the last three past presidents, will make a total membership of 17. The other modifications provide a method for acceptance and publication of proposed new standards as tentative standards in the interim between annual meetings of the society, a saving of time being thus effected.

Total Membership at New High—4244

Membership of the society made a net gain for the year ended June 1, 1929, of 52. The number of new members for the year was 365, which is slightly better than for 1928 although not so large as that of two or three years ago. Total membership as of June 1, this year, is 4244 as against 4192 a year ago.

Activities on the Pacific Coast

During the past year the executive committee decided to investigate plans that had been under consideration for some time for the establishing of a closer relationship between the society's general activities and the members on the Pacific Coast. As a first step in this direction Secretary-Treasurer C. L. Warwick visited the members in the three Coast States of California, Oregon and Washington last fall. A comprehensive report has been submitted to the executive committee. Among several recommendations is one to the effect that a study be made of the feasibility of devising some means by which Pacific Coast members may function as a group, and means by which groups of members representing producers and consumers may be formed into divisions, affiliated with and functioning as a part of the standing committee.

It was also recommended that the executive committee give consideration to the possibility of arranging for occasional meetings of the Pacific Coast members under official auspices, and that local committees of society members in the Los Angeles, San Francisco, Portland and Seattle districts be appointed for the purpose of promoting the usefulness and extending the influence of the society in those districts. The various recom-

mendations are being carefully considered by the executive committee.

The New International Association

Preliminary arrangements for the participating of the society in the next congress of the International Association to be held at Zurich, Switzerland, in 1931, are now being made by the society's representative on the permanent committee of the New International Association for Testing materials, past-president W. H. Fulweiler. On June 1, 1929, there were 243 members of the A. S. T. M. who became members of the international association, 38 being companies and 205 individual members.

To Take Part in World Engineering Congress

The executive committee has accepted an invitation for the society to participate in the World Engineering Congress to be held in Tokio, Japan, this year, under the sponsorship of the Japanese Government. As part of the American participation in the congress, Prof. H. F. Moore, University of Illinois, and past-president of the society, has prepared a paper on "Engineering Materials" for presentation at the congress.

Marburg Lecturer Brings Physicist and Engineer Closer Together

A FEATURE in the last three years has been the Edgar Marburg lecture, founded in 1926 in memory of the society's first secretary.

This year Dr. Saul Dushman was selected to deliver the fourth lecture. The choice was eminently fitting, the address bringing out the close relationship between the physicist and the engineer. Dr. Dushman is assistant director of the research laboratory of the General Electric Co., Schenectady, N. Y. Educated at the University of Toronto, from which he was graduated in 1904, he was a lecturer there before joining the research staff of the General Electric Co. in 1912. The subject of his lecture was "The Nature of Cohesive Forces in Solids." An abstract follows:

The Bohr theory of the origin of spectra led to definite conclusions regarding the arrangement of electrons in the atoms of the different elements. It has been shown that the electronic configuration and a large number of properties of the elements vary in a periodic manner with the atomic number. At least four cohesional properties show this periodic relation with electronic arrangement. These are as follows: The reciprocal of the melting point on the absolute scale, the atomic volume, and coefficients of compressibility and expansion.

Ductility and Malleability of Metals Dependent on Structure

The crystal structure of pure metals also shows a similar connection with electronic arrangements, and certain properties, such as ductility and malleability, are observed to be intimately dependent upon the type of lattice structure. The fact that atoms are arranged in regular lattice formations leads to revised views on the nature of so-called secondary valence of forces. Cohesional forces are essentially no different from chemical forces except in order of magnitude.

While it is not possible as yet to formulate a theory of cohesion in solids based upon atomic structure, it is possible to calculate the magnitude of such forces by introducing plausible assumptions regarding the laws of attraction and repulsion between atoms. As shown by Grumeisen for the case of pure metals and by Born for ionic lattices (such as rock salt), there must exist definite relations between the theoretical cohesive force between atoms and such experimentally observed values as density, latent heat of evaporation and coefficients of expansion and compressibility. The cohesive forces, calculated on the basis of this theory, are found to be from 10 to 100 times greater than the rupture strengths actually observed.

In explanation of this discrepancy, Griffiths and Smekal suggested the presence of fine cracks, crevices or inhomogeneities in the crystal structure. Various observations made by these and other investigators are found to be in good accord with such an assumption. The theory has been extended quite recently by Zwicky and evidence adduced to show that the distribution of such cracks must be governed by the lattice structure and that this accounts for the fairly definite values actually obtained technically for rupture strength of different materials.

Most interesting results have been obtained from investigations on the tensile behavior of single crystals. The application of such results to the observations in the case of polycrystalline materials leads to similar views as those postulated by Griffiths, Smekal and Zwicky.

Cohesive Forces and Strength of Metals at High Temperatures

The effect of temperature on the rupture strength is discussed at length by Dr. Dushman. A plot of the observed data against temperature shows two distinct portions, one below a definite inflection temperature which is approximately linear, and the other, which extends from the inflection temperature upward, shows a very much more rapid decrease in strength with temperature. In explanation of these observations an extension is suggested of the theory previously postulated by Jeffries and Archer with regard to the relative strength of crystalline and intercrystalline material. The inflection point in the plot of rupture strength versus temperature is probably to be identified with the so-called equi-cohesive temperature. Above this point deformation occurs by viscous flow, and consequently the rate of decrease in tensile strength with temperature is dependent upon the rate of decrease with increase in temperature coefficient of viscosity.

Analogy with other reactions, both chemical and physical, whose rates change with temperature in the same manner suggests that, from the temperature coefficient of the rupture strength, it should be possible to calculate the energy required to cause relative translational motion of atoms or grains such as occurs in plastic flow of solids. The values of the energy thus calculated are found to lie between the heats of fusion and evaporation. The nature of the previous treatment of the metal and other factors affect the value of the energy as actually observed.

Similarly, from the rate of grain growth, rate of diffusion, electrolytic conductivity of salts, viscosity of glass, rate of flow of metals, each of which changes rapidly with temperature, it is possible to calculate the energy involved in the reaction. Thus the study of the effect of temperature on all these phenomena furnishes a means of determining the particular type of cohesive forces which are involved.

Marburg Lecturer and Dudley Medalists

SAUL DUSHMAN

L. W. SPRING

J. J. KANTER

Two Recipients of the Dudley Medal

IT is customary each year to award the Charles B. Dudley medal to the author or authors of the paper adjudged to be the best one presented at the previous annual convention. The third award was made this year to J. J. Kanter and L. W. Spring, joint authors of the paper, "Long-Time Flow Tests of Carbon Steels at Various Temperatures with Particular Reference to Stresses Below the Proportional Limit."

During the last four years Mr. Kanter, who is testing engineer of the Crane Co., Chicago, has been engaged in the development of creep test apparatus and in investigations in this important field of high temperature

President, Vice-President and Retiring President

T. D. LYNCH

F. O. CLEMENTS

G. W. THOMPSON

testing of metals. Mr. Spring is active in the A. S. T. M., A. S. S. T., and other technical societies, and is chief chemist and metallurgist of the Crane Co. His technical articles in chemical and physical testing have been numerous.

Presentation of the medals followed the Marburg lecture. President G. W. Thompson made the presentation speeches, and both recipients responded, Mr. Spring outlining some facts leading up to the work referred to in the paper and giving some history of high temperature testing.

Standardization and Good Will

IN his annual address as the retiring president, G. W. Thompson, chief chemist, National Lead Co., New York, took as his subject "Standardization and Good Will." Some of the chief points he made were as follows:

The President of the United States, Herbert Hoover, when he was Secretary of Commerce made many speeches and issued many communications to the public in the general advocacy of standardization. While not attempting to present Mr. Hoover's views in detail, there is one thought that runs through all of his addresses on this subject to which I would direct your attention. In the United States, industries are conducted on a large scale. In order that these industries should be profitable it is necessary, so far as is practicable, that the products manufactured be simplified as to number and kind so that large production of unit types of products can be made day in and day out. In order to do this the products must be standardized to meet the demands of the consumer. The only limitation to this point of view is that the standards should not go so far as to prevent the obtainment by the consumer of materials that are best suited to his needs.

If there ever was a democratic organization in the best sense of the term, our society is one. In theory at least, and actually I believe, our committees are made up of those who have common ends approached from different standpoints. Our committee meetings are in principle those of the round table where, while you have nominal chairmen, there is no head nor foot but all sit down at the table with equality. If it ever so happened that our committee meetings became in the nature of the long table with a head and a foot, unfortunate it would be for our society.

What is more, our society has wide-open doors and if any consumer, or group of consumers, has an interest in the standardization of materials for engineering he finds the spirit of our society welcoming him as a member, and the same is true with regard to the producers.

One Great Difficulty Confronting the Society

We may as well speak openly about one of the great difficulties that confronts our society. There are a large number of industrial organizations in this country that are inclined to resist standardization on the ground that it substitutes something for the good will their organizations are trying to build up by the expenditure of large sums of money for advertising. They consider that standardization and the building up of good will are incompatible. To a certain extent I sympathize with this view although my better sense condemns it in so far as it relates to the standards of this society.

So far as consumers are concerned, they have specifications of their own if they are not more generally standardized by a body such as ours. Therefore, standardization by our society, as it affects the large consumer, substitutes general standards for isolated standards. The large consumer will generally buy in the open market on more or less of a competitive basis. He may have his preferences and he may prefer to give his orders to certain producers, but this depends largely upon other things being equal, such as price and quality of product. I must emphasize, however, that what I say has relation only to those materials which are bought in relatively large quantities for specific purposes.

What I say does not relate to the purchase of small quantities of material for very indefinite purposes which materials have been found by experiment and use to satisfy the needs of the consumer. It is not for me to draw the line between these two groups of materials and their uses but that there is a distinction between them is clear. Of course, specification of materials used in large quantities will also cover the use of these materials in small quantities, which is of advantage to the general public.

Let us think on the other hand as to the effect upon the producer and the good will he is endeavoring to build up when he has a record of having furnished some standard product to a large consumer year in and year out with extreme satisfaction to the consumer. It is presumed that the consumer has examined carefully the products delivered to him by this producer. The weights and volumes have been checked, analyses have been made of the product, and this product has been uniformly found to conform to standard specifications. Does this add anything to the value of the good will of the producer? I am sure it does add a great deal to that value.

All consumers naturally want to buy in the cheapest market. This desire exists whether there are standard specifications or not. Suppose there are no standard specifications, what will the consumer do? He will buy in the cheap market just the same, but he will be far more subject to those blandishments of the salesmen with which we have in the past been too familiar.

It is said that standard specifications are often compromises. As a statement of fact this is undoubtedly true. As a basis of criticism it is unsound. A standard specification, whether it is good or bad, has only the same kind of value which attaches to everything else. It is good or bad according to the way it works. All specifications, when we study the history of them, began with what are called "bad specifications," or, as some would say, imperfect specifications, using what I consider a very improper designation. It is the order of progress that what we did yesterday should be bad and imperfect as compared with what we do today, but we must remember that what we do today is based upon what we did yesterday.

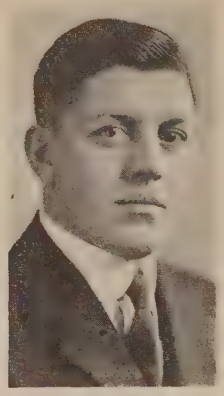
Standard Specifications Subject to Change

Standard specifications are not fixed things; they are constantly subject to change. They should not be adopted prematurely, neither should they be amended prematurely, but they should show constant growth. In our society, with our standing committees made up of both producers and consumers constantly studying the problems covered by specifications, there is a quick response as to the efficiency of specifications. Sometimes producers and sometimes consumers will not use specifications. Time only can tell whether they are right or whether they are wrong. As to the criticism that standard specifications are usually compromises, that we admit and we admit cheerfully in that we do not know of anything in life that is not a compromise.

Permit me to sum up this talk with these few words. Our society occupies an impregnable position, impregnable so long as we perform our functions rationally, justly, and with a continuous process of development. We have no desire to break down any good structure in industrial life. Our object is to build as far as we can on sound foundations, going only as far and as fast as we feel that the circumstances justify. We aim to move constantly forward, requiring no push or prod, for our aims are clear and our methods of procedure have stood the test of time. If, however, our society would live up to its great purpose none of its members and none of its committees must stand in the way of general progress along the lines of proper development. I trust that our future will far exceed in brilliance our past in the service which we are rendering to in-

New Directors for Next Year

CHARLES R. HOOK



G. E. WARREN

H. E. SMITH

G. B. HAVEN

dustry, to our country, and to the world at large.

New Work of Some Prominent Committees

AMONG the many committees whose annual reports were adopted, several should be mentioned.

Committee A-1 on steel, the society's largest one, presented new specifications for heat-treated carbon steel helical springs and a complete revision of the standard specifications for carbon steel forgings for locomotives. The immediate adoption of revisions of the standard specifications for carbon and alloy steel blooms, billets and slabs for forgings and for wrought solid carbon steel wheels for steam railroad service was recommended.

An Old Contest Revised and Settled

Revival of an old contest was brought to the floor of the convention. When the advancement to standard of tentative standard specifications for carbon steel castings for valves, flanges and fittings for high temperature service (A95-28T) was brought up for adoption, there were decided objections.

For six years the question of discriminating against the converter process for making such castings and of adopting definite chemical limits has been debated with some bitterness. This year the familiar arguments were again voiced. John Howe Hall, A. H. Jameson, and Prof. Bradley Stoughton argued against the adoption of the specifications as standard while L. W. Spring, V. T. Malcolm and R. A. Bull favored the adoption. When the final vote was taken, 43 favored the advancement to standard with 11 voting negative.

Splendid Work of Committee on Cast Iron

Undoubtedly one of the most active committees in the ferrous phase of the society's work is now A-3 on cast iron. During the year it successfully organized a symposium on the engineering properties of cast iron, which was a valuable contribution to a revival of interest in this product. A review of this symposium is printed on other pages. Too high praise cannot be voiced for this effort.

Arbitration Bar Adopted

After several years of investigation and debate, a committee recommended for adoption as standard the specifications for the arbitration test bar and tension test specimen as a revision of standard specification for gray iron castings, cast iron pipe and fittings and high-test gray iron castings. It also recommended new specifications for gray iron castings for valves, flanges and pipe fittings, as well as for chilled tread cast iron car wheels, as a revision of the present standard specifications.

Tin and Arsenic Harmful to High-Speed Steel

Report of the research committee on the effect that tin and arsenic have on high-speed tool steel, was that special heats had been made containing respectively 0.40 per cent of arsenic and 0.40 per cent tin. Service tests of tools made of this steel,

New Officers and Directors for 1929-1930

President:

T. D. Lynch, consulting metallurgical engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Vice-President:

F. O. Clements, technical director, Research Laboratories, General Motors Corporation, Detroit.

Members of Executive Committee:

G. B. Haven, professor of machine design, in charge of textile laboratory, Massachusetts Institute of Technology, Cambridge, Mass.

C. R. Hook, vice-president and general manager, American Rolling Mills Co., Middletown, Ohio.

H. E. Smith, engineer of materials, New York Central Lines, New York.

G. E. Warren, assistant general manager, Portland Cement Association, Chicago.

such as cutters, reamers and twist drills, showed conclusively that such steel was unsuited for twist drills, and that it was detrimental in service for cutters and reamers.

High Temperature Committee to Be Reorganized

A report by the joint research committees of A. S. T. M. and A. S. M. E. on the effect of temperature on the properties of metals was not made. This committee is undergoing a reorganization. Chairman G. W. Swaathoff has resigned, and C. E. MacQuigg has been selected as temporary chairman, pending a permanent organization.

At some of the sessions on metals several papers of importance were presented. There were three in particular on fatigue of metals, and one by L. W. Fry, Standard Steel Co., Burnham, Pa., on "The Effect of Reduction from Ingot to Forging on Steel Forgings." These will be briefly reviewed in later issues of THE IRON AGE.

There were two sessions on nonferrous metals, at which various committee reports as well as original papers were presented. These will be the subject of review in later issues of THE IRON AGE.

Prominent Men as New Officers

AS president for the next year, the society has selected T. D. Lynch, consulting metallurgical engineer, Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. He was graduated from West Virginia University in 1891. From 1922 to 1923, he was president of the American Society for Steel Treating. He is also a member of the Engineering Society of Western Pennsylvania and of the International Society for Testing Materials and is active in the committee work of the American Foundrymen's Association and of the American Standards Association.

For vice-president, F. O. Clements has been elected. He is technical director, research laboratories, General Motors Corporation, Detroit. He is a graduate of Otterbein College, Westerville, Ohio, in 1896. He has been chemist successively for the Pennsylvania Railroad, Union Pacific Railroad, National Cash Register Co. (1905 to 1917) as chief chemist and engineer of tests, and director of research, Dayton Metal Products Co., Dayton, Ohio. He has held his present position since 1920. He is a member of the American Chemical Society, the A. S. T. M., the A. A. A. S., the A. S. S. T., the American Electrochemical Society, the Institute of Metals (Britain) and the S. A. E.

Four new directors were chosen, one of whom is G. B. Haven, who is professor of machine design, Massachusetts Institute of Technology, was a graduate of that institution in 1894. For 11 years he was associated with the late Prof. Peter Schwab. He has been in his present position since 1910, in charge of textile research.

Another director is Charles R. Hook, vice-president and general manager, American Rolling Mill Co., Middletown, Ohio. Graduated from the Walnut Hills High School of Cincinnati, he secured his first position as office boy with the Cincinnati Rolling Mill & Tin Plate Co. Next he became night superintendent of the company he has been with ever since. He is president of several banks and a director in several corporations.

The third director is H. E. Smith, well known among railroad men. He was graduated in chemistry from the Massachusetts Institute of Technology. He has been connected with several railroads, particularly the New York Central, of which he is now engineer of materials in charge of specifications and special investigations of materials.

As the fourth new director, the society has chosen G. E. Warren, assistant general manager, Portland Cement Association, Chicago. He was graduated from the University of Illinois and has served on several important cement committees.

Metal Lath Makers Adopt Trade Rules

WASHINGTON, June 29.—A code trade practice, including 24 rules, was adopted for the metal lath industry here on Thursday when the Associated Metal Lath Manufacturers held a trade practice conference with the Federal Trade Commission, represented by Commissioner W. E. Humphrey and M. Markham Flannery, director, Trade Practice Conference Division. The rules set up at the conference cover largely the scope that is treated in such conferences. Breach of contract, misbranding or misrepresentation, misrepresenting competitors' prices, defamation of competitors, secret rebates and selling below cost were among practices that were condemned.

Approval was given to the principle of a reasonable differential in prices charged to dealers and to contractors when sold equal qualities and in substantially equal amounts, and to the practice of each individual member independently publishing and circulating his own current prices, and also notices of all advances, declines or other changes in price. The principle that there shall be no discrimination as between purchasers of the same class was adopted, with the provision that there was no obligation to maintain any price any length of time.

Sale or offering for sale of any product of the industry at carload prices when shipped in less-than-carload quantities was condemned as an unfair trade practice, as was the sale or offering for sale of any product under any form of guarantee, to the purchaser or proposed purchaser, against advance or protection against decline in prices. Blanket contracts were condemned, while approval was given to standard contracts. The practice of dumping surplus stock of metal lath and accessories, at low discriminatory prices, was declared to be an unfair method of competition.

Tests of Interlocking Steel System

Laboratory tests at the Rensselaer Polytechnic Institute, Troy, N. Y., have been made of the Wait interlocking steel system, consisting of two-story bents and of column construction. The tests were under the direction of Prof. T. R. Lawson, head of the department of civil engineering. An illustrated pamphlet describing the system and the tests to which the members were subjected has been published by Wesley Wait, Newburgh, N. Y.

Comparative tests were made on two-story bents of riveted structures, interlocked structures and interlocked welded structures. In each case the test was carried to the point where some member buckled.

Production and Shipment of Raw Materials and Finished Products in May

	May, 1929	April, 1929	May, 1928
Enameled sanitary ware shipments (a), pieces	341,927	348,385	461,124
Babbitt metal (a), consumption, lb.	5,472,008	6,046,445	4,606,899
Steel boilers, new orders: (a)			
Number	1,749	1,706	1,836
Heating surface, sq. ft.	2,143,257	1,769,427	1,661,173
Steel furniture: (a)			
New orders	$2,845,826	$2,880,395	$3,085,638
New orders, 5 months	15,562,878	.....	15,828,337
Shipments	2,791,306	2,844,939	3,213,291
Steel shelving: (a)			
New orders	1,127,431(b)	1,095,329	732,921
New orders, 5 months	5,387,524	.....	3,824,735
Shipments	990,651	1,131,362(c)	768,988
Electric power production (d)	8,093,373	7,881,620	.....
Made by water-power (d)	3,485,021	3,285,154	.....
Bituminous coal mined (e), net tons	40,172,000	36,888,000	36,624,000
Anthracite mined (e), net tons	6,308,000	6,441,000	8,124,000

(a) United States Department of Commerce.
(b) Second largest total ever recorded; exceeded only by March, with $1,145,632.
(c) Largest total ever shipped.
(d) United States Geological Survey; figures represent thousands of kwhr.
(e) United States Bureau of Mines.

Foundrymen Hold London Meeting

Representatives of Many Nations at Third International Congress—Test Bar Correlation and Alloy Irons Fully Discussed—Large Exhibitions a Feature

(Special Correspondence)

LONDON, ENGLAND, June 17.—The Third International Foundrymen's Congress was held in London from June 11 to 15, at the same time as the twenty-sixth annual convention of the Institute of British Foundrymen, and in conjunction with the largest working exhibitions of foundry and shop equipment ever held in Europe. Many of the delegates, in particular those from America, arrived in London last month.

Foundrymen from America Banqueted

The American delegation, among whom were S. T. Johnson, president; Fred Erb, vice-president; S. W. Utley, past-president; C. E. Hoyt, secretary, and R. E. Kennedy, technical secretary of the American Foundrymen's Association, were welcomed on their arrival in London at a banquet held on May 23, over which Sir Hugo Hirst presided. This was followed by an extensive tour of the industrial and other parts of the country, which lasted until June 9, and in the course of which the delegates visited, as the guests of the local branches of the Institute of British Foundrymen, Birmingham and Coventry, Manchester, Oldham and district, Glasgow, Edinburgh and Sheffield, in addition to Shakespeare's country, the Derby and Matlock and the lake districts. The Congress was preceded on Monday, June 10, by the annual general meeting of the Institute of British Foundrymen, when Wesley Lambert was elected president for the coming year, with F. P. Wilson and A. Harley, vice-presidents.

Two Medals Presented

The congress which has just closed is the third of the series of triennial international foundrymen's congresses, the first of which was held in Paris in 1923 and the second in Detroit in 1926. It opened on June 11 in the Grand Council Chamber of the historic Guildhall in London, which was crowded with delegates from Great Britain, and many countries overseas. This in itself is a notable tribute to the importance of the foundry industry, and to the improved status which has come about as a result of the untiring efforts of a number of able and farseeing men in the industry.

Sir Kynaston Studd, Lord Mayor of London, extended a cordial welcome to the delegates, and presented two medals. The first, a gold medal, was awarded to Prof. T. Turner, late professor of metallurgy, University of Birmingham, and a past-president of the Institute of Metals, as a permanent souvenir of a presentation made to him two years ago, on behalf of the Institute of British Foundrymen and the British Cast Iron Research Association, on the occasion of his retirement from his professorial duties at Birmingham. Professor Turner returned thanks for this expression of approval of the work he had been able to do, and also took the opportunity to thank his American friends for having presented to him, through his son, at Detroit, nearly three years ago, their Siemens medal.

The second medal, the Oliver Stubbs Medal, was presented to the president, Wesley Lambert. This is awarded annually to the member of the Institute of British Foundrymen who has contributed the most meritorious services during the year, and it is the first time the medal has been awarded to a representative of the non-ferrous side of the industry.

A pleasant feature of the Guildhall meeting was the delivery of short addresses by the heads of delegations from the various countries overseas. The countries the representatives of which spoke were America, Germany, France, Belgium, Italy, Holland, Poland, Spain, Luxemburg, Czecho-Slovakia and Denmark.

Progress of the Foundry Traced by the President

In his presidential address Wesley Lambert traced the progress of the foundry industry through improvement in building design and construction, planning and layout of the foundry, and the installation of machinery. Touching upon progress in the art of molding, Mr. Lambert said that the journeyman molder had progressed so far today that he was making high-duty complicated castings with intricate cored parts which the old-time craftsman would have considered to be beyond the bounds of possibility.

Commenting upon the development of the aluminum casting industry, the president predicted that in the not very distant future even lighter alloys, mainly composed of magnesium, would become a serious rival for the engineer's favor. Chemical and superheat plant engineers are giving enthusiastic testimony to the progress which had been attained in the fabrication of special irons and non-ferrous alloys to meet their particular requirements.

One of the most outstanding applications in foundry practice is the extended use of oil-sand cores which have rendered possible the mass production of intricately-cored castings which at one time would have taxed the skill of even the most painstaking craftsman.

The laboratory side of the modern foundry has also progressed considerably, along with technical progress, and what is of equal importance is the great improvement that has taken place in the general design of the buildings and of their equipment for the welfare of the workers.

Immense Possibilities for the Future

The future of the foundry industry holds immense possibilities, said the president. It is common knowledge that in so comparatively recent times as the reign of Queen Elizabeth only seven or eight metals were known, of which only four, iron, copper, tin and zinc, were in use for the compounding of constructional — as distinct from ornamental—alloys, whereas today, as a result of intensive scientific research, 61 metals are now available, and, year by year, one or more of the previously rarely used metals is being harnessed to the service of mankind in the form of alloys for industrial uses, the immense possibilities of the utilization in the foundry of these later discovered metals affords subject matter for fascinating conjecture.

It may be seen, by the use of a simple formula, that if a complete series of binary alloys of all the known metals were compounded in merely one uniform proportion, such as 50:50, the number of alloys resulting would be 1830; if ternary—three-metal—alloys were made also in one definite proportion only, the number of different alloys would total 35,990. To go but one step further, if a complete series of quartenary, or four-metal, alloys, in one uniform proportion, such as 25 per cent of each of the four metals constituting any one

alloy were attempted, 521,855 separate alloys would have to be produced before each of the known metals was thus proportionately employed in its own group in this series of alloys.

In concluding his address, the president paid a tribute to the foundrymen from overseas who were attending the congress, all of whom had generously contributed toward improving the condition, the efficiency, and the output of the industry. He hoped to see closer association among institutes and organized bodies representing the foundry industry of the world, which would result in raising that industry to the high status which its science and craftsmanship so fully merited.

Some of the Technical Papers

Abstracts of some of the many papers and discussions presented at the various sessions are as follows:

Inter-Relationships in Gray Iron Metallurgy

PRESENTED on behalf of the American Foundrymen's Association by J. W. Bolton, the Lunkenheimer Co., Cincinnati, the paper on the above subject deals with schemes of correlation, and discusses two important problems:

(1) Study of the influence of manufacturing practice on given grades of cast iron; and

(2) Relationship of test results to engineering properties of the casting.

The first problem is solved as follows: Arrange a classification of irons according to composition: and make an intensive study of each grade. In this study it is necessary to give consideration to the influence of the four following factors:

Chemical composition of metal, initial, incidental and final;

Structural, mechanical and chemical make-up of charge (all materials);

Melting process, conditions chemical, thermal and mechanical; and

Thermal, chemical and mechanical history, furnace spout to finish casting.

On the second problem two viewpoints predominate—one that of many British and Americans, who believe that test results can be correlated so that properties of castings may be predicted therefrom with reasonable accuracy, and the other that of the French and other Continental investigators, who hold that tests must be made on the castings themselves.

It is logical to expect that if a ladle of the same grade of iron is divided into two parts and each part subjected to exactly the same treatment, the two resultant materials will be the same.

Correlation Necessary or Research Is Futile

Reasonable correlation of tests to the properties of the castings themselves must be established or cast-iron research is futile. That it is possible to tell a great deal about the quality of the metal in the casting, is evident from the following considerations:

(a) Many working properties of steel and other metals are predicted regularly from tests. Granting the limitations of the tests and the difficulty of their exact interpretation, which, by the way, applies to all materials, no one would deny that great progress has been made by use of tests. In a general way tests are used every day to determine properties of commercial metals.

(b) If in two or more cases exactly the same grade of material is accorded the same or equivalent treatment, the altered materials will still be the same, one to another.

(c) Test bars are castings of certain specified shape and dimensions. If castings and test bars all of the same analysis and cooling rate are poured at the same time from the same material, one would expect to find similar metal in each. The problems encountered are: (1) to make test bars whose cooling rates are like those of the castings, and (2) to use common sense in making allowance for peculiarities in design and foundry practice—particularly those which may promote shrinkage or other defects and those which call for slow or fast pouring of castings.

(d) These points are borne out because the foundryman of wide experience can take an analysis and a result on one of the so-called arbitration test bars and many times predict quite closely what the iron in the casting will be like.

It then is possible to solve the second problem—relationship of test results to the properties of the casting. What is needed is cooperation in accumulation and interpretation of sufficient data. Careful study must be made of test methods. In the correlation shown in the examples above, the general agreement becomes more remarkable when it is considered that (a) the metal flow in the castings may be slower than in the bar; (b) that the machined tensile bar is in case of the castings closer to the cooling surfaces than in the tensile bars—thus neglecting the well-known and demonstrated differences due to cooling gradients of unlike sections of similar volume surface-area relationship. This is most apparent in larger sections.

The usual commercial impracticability of the French scheme of trepanning a small shear sample from actual castings appears a barrier to the widespread use of this method. In America, attempts to get similar tests into specifications for steel castings have been opposed. There may be some merit in the idea of cast-on bars for certain types of casting. The work of the late George K. Elliott, Willard Rother, and the writer demonstrate certain objectionable features in the original Fremont test. This test, as proposed, was hardly precise enough for use in commercial specifications. The machine did not seem sufficiently rigid and the method of preparation of the test bar by a hollow drill is open to criticism.

Accurately-machined bars are an absolute necessity, and a rigid and accurate machine is needed. The test piece proposed was too small to be representative of the general properties of the iron. On the other hand, the basic idea of the French engineers is very good. With proper modification, the shear test is quite useful in research work.

Larger Test Specimens Necessary, Says American

Referring to the trepanning of specimens and the attempt to correlate the results of tests on bars taken from the castings and on cast specimens, R. F. Harrington, metallurgist, Hunt-Spiller Mfg. Corporation, Boston, said it is becoming more fully realized that it is necessary to use larger test specimens than had been used hitherto, in order that the results obtained may be more strictly comparable. He anticipated that the A. F. A. will be able to shed more light on that particular subject. He was glad that Mr. Bolton had emphasized, above all, the fact that foundrymen have to sell castings, and not test bars, and that they are concerned to turn out proper castings by the adoption of sound foundry methods.

J. T. MacKenzie, chief chemist, American Cast Iron Pipe Co., Birmingham, Ala., said that the work of the A. F. A.'s committee on gray cast iron is concerned with the examination of the properties of the iron in the molten state, with the idea of determining the properties which make for the production of sound castings or otherwise. They have just completed some work of considerable magnitude on the determination of the temperatures, and have shown up the faults of the optical pyrometer in that regard. Following that, they are engaged upon a study of the shrinkage of cast iron in the freezing range. If they are successful in developing a test for that, it will be extended to the contraction from the freezing point to room temperature, which will include shrinkage as we now know it. Mr. MacKenzie said he could not emphasize too strongly his belief that the soundness of the casting had more to do with the quality of the cast iron than with the tensile strength of the test bar.

Results put forward in the paper represent a considerable amount of practical work, and, combined with it, an attempt at scientific correlation, said Prof. T. Turner, Birmingham, England. In earlier investigations of subjects of this kind we have been content to say that a thing is good or bad, or very good or very bad, and we have had no quantitative values. We do not become scientific until we can express many of the properties

in figures, but he uttered the warning that if we do use figures, we must be sure that they are correct, because there is nothing more misleading than wrong figures.

Intermediate Forms of Graphite Exist

Discussing the amount and form of graphite in the castings, Professor Turner said that graphite is sometimes very fine indeed, like soot; sometimes it is in the form of curved flakes, and sometimes in the form of flat flakes. Those are simple kinds of graphite, but there are also intermediate qualities, each of which corresponds to entirely different physical properties in the material, and when describing graphite one should endeavor to state to which class it belongs, or whether it is a mixture of more than one class. Some graphite is so small that it can hardly be seen with the aid of a microscope, while some is in the form of flakes almost as large as one's finger nail, and there are other sizes between these extremes. He urged that there should be evolved some method of classifying graphite microscopically, as, for instance, in terms of inches or millimeters.

That the paper was a condemnation of the use of test pieces cast separately from the actual castings was suggested by E. V. Ronceray of France. He was glad to note that the author attached great importance to the soundness of castings, because at the Foundry High School in France the students are taught that the first four important factors are (1) soundness; (2) tensile strength or internal strain, (3) strength of material and (4) cost.

The author's remarks as to the importance of the melting conditions were confirmed by J. G. Pearce, director, British Cast Iron Research Association. Discussing the problem of the volume/surface-area ratio, he said he had carried out some work on the mechanical properties of cylindrical bars, and had tried to relate the strength of the bars of different thicknesses to the diameter. The cylindrical bar is a very simple casting, and the ratio might work in simple cases, but, in regard to the more complicated castings, he was not so optimistic.

Excellent American Work on Correlation

After paying a tribute to the American foundrymen for their wonderful work on correlation, J. E. Fletcher, consultant, British Cast Iron Research Association, said that the research association has been trying to correlate as far as it could the various properties of cast iron as influenced by cooling rate and composition. There is one phase of this subject, however, which is sometimes left out of consideration, namely, the conditions of the making of the raw material in the blast furnace, which influence in such a serious fashion the ordinary casting, and he suggested that foundrymen should try to obtain from the blast furnace people a good deal more information than they have hitherto vouchsafed to give.

Discussing the test results relationship, John Shaw, consultant, Southsea, England, said he would not care to accept the tensile result of a bar of the same composition as the casting, if that bar had not been cast out of the same ladle of metal; neither would a shear result converted into a tensile be acceptable. While it might be granted that, under the very closely controlled conditions specified by Mr. Bolton, approximations in both cases are possible, and their use for works information and research of great value, these approximations cannot be acceptable to the buyer of the casting.

Chromium, Manganese and Nickel in Cast Iron

INVESTIGATIONS carried out in the Works of Scott's Shipbuilding & Engineering Co., Ltd., Greenock, said Dr. J. W. Donaldson, in a paper "The Influence of Chromium on Cast Iron," show that chromium added to gray cast iron in quantities up to 0.90 per cent increases the stability of the combined carbon at temperatures up to 550 deg. C. This increase in stability is probably due to the presence of chromium carbide in the cementite of the pearlite, and is reflected in the increased strength both at ordinary and elevated temperatures and in the Brinell hardness. Better heat-resisting irons are, therefore, obtained, but there is difficulty in machining irons with over 0.4 per cent of chromium.

Chromium and Manganese as Alloys

Influence of chromium on volume changes at temperatures below the critical range is erratic, but the general effect is to produce a contraction. The nature of this contraction is difficult to explain or define. With chromium up to 0.4 per cent the thermal conductivity is increased by about 8 per cent. Small additions of chromium reduce very slightly the corrosion of gray cast iron. The effect is most noticeable with sea water, and to a lesser extent with strong acids. With weak acid, tap water, and ammonium chloride little advantage is gained.

Gray cast irons, which contain only traces of sulphur and manganese have abnormally high combined-carbon contents, e.g., 1.3 per cent, says Dr. A. L. Norbury in a paper, "Manganese in Cast Iron." Increasing the manganese from traces up to 0.3 per cent causes the combined carbon to drop to normal (e.g., 0.8 per cent), and causes a decrease in the tendency to chill. Further additions of manganese up to 1 or 2 per cent tend to increase the combined carbon and increase the tendency to chill. The explanation put forward is that the graphitizing action, found on increasing the manganese from 0 to 0.3 per cent, is an indirect one due to the manganese combining with and nullifying the carbide-stabilizing action of traces of iron sulphide. It appears that about 0.3 per cent manganese in excess of the amount theoretically required to form MnS is required to do this.

Approximately the same excess of manganese, e.g., 0.3 per cent, is required in irons containing higher sulphur contents, e.g., 0.1 and 0.2 per cent sulphur. The high combined-carbon contents found in gray irons containing only traces of manganese and sulphur are due to hard spots of cementite — austenite — iron-carbide eutectic plus secondary cementite, and to patches of secondary cementite, stabilized in each case by traces of iron sulphide. Apart from its indirect graphitizing-action, due to its combining with and neutralizing iron sulphide, the normal action of manganese is to stabilize iron carbide and to increase the tendency to chill.

Application of Nickel in Cast Iron

Its equalizing action on the structure of thick and thin sections of a casting is the basis of the application of nickel in cast iron, said Dr. A. B. Everest. It has been established that whereas an ordinary iron cast in a ⅛-in. section will show a white chilled structure, at the same time this iron will be open and soft in a heavier section of 1 in. or more. Nevertheless, in the corresponding nickel iron, the tendency to chilling is eliminated, so that the thin section is gray and machinable and at the same time the heavier section is appreciably hardened, owing particularly to the action of nickel on the matrix of the iron. Records show that in some cases a hardness difference of about 200 Brinell between the ⅛-in. and 1-in. section of a casting may be reduced to about 20 points in a casting suitably alloyed with nickel, and at the same time the iron is appreciably hardened and strengthened in the heavier sections.

The practical result of this equalization is that the nickel iron shows a much greater latitude as compared with the ordinary iron, so that uniform structure may be obtained over a wide range of section thickness. This has an important application in the foundry in enabling certain diffi-

cult castings to be made satisfactorily, in which high hardness and strength is required in heavy sections; or sections which cool slowly owing to casting design, while the metal quality is determined by the machinability of some thin section on the outside of the casting.

As an example, reference is made to the case of motor cylinder blocks, where the hardness and closeness of the cylinder bores and of the valve seats are of paramount importance in obtaining maximum wear, and yet the quality of iron is often determined by the machining requirements on some small water-exit boss situated in the middle of a thin section water-jacket. The use of nickel in cast iron tends toward a general uniformity of product, which is of great value in production work where variation in machinability is to be avoided.

These three papers were discussed together.

Little Progress in Control of Shrinkage

It would be useful to hear from Dr. Norbury something about the shrinkage in gray cast iron which gives trouble in the foundry, viz., draw holes shrinkages, said Mr. Field. A certain amount of work has been done by Cook and others but, in general, foundry practice has progressed little in the past 20 years in the control of draws and shrinkages through the analysis of the iron used. This is undoubtedly one of the greatest difficulties which the general iron founder, making a large range of work, has to deal with. Mr. Field said he believed it was generally recognized that Derbyshire iron gives less trouble with draws and shrinkage than Northamptonshire iron. He has proved this time after time in separate experimental heats running into hundreds, and has come to the conclusion that the manganese in the Derbyshire iron, which is greater than in the Northamptonshire iron, has a great deal to do with the immunity of the Derbyshire iron from shrinkage.

Favorable Results from Nickel in America

R. S. MacPherran, chief chemist, Allis-Chalmers Mfg. Co., Milwaukee, remarked that experience in the United States entirely confirmed statements by Dr. Everest. From ½ to 1 per cent nickel is used in castings for cylinder liners, crank-heads, etc., and in that way castings had been obtained which otherwise would not have been machinable. By adding 1 per cent nickel something like 0.5 per cent silicon is taken out and a machinable casting obtained. So far there has not yet been developed in the United States a satisfactory machine for testing wear in cylinders or frictional wear generally. As regards shrinkage, this had been reduced in the United States by using a lower phosphorus content. In that way the good castings had been increased, keeping the phosphorus below 0.2 per cent.

That mere reduction of silicon to any extent is necessarily a step in the direction of increasing solidity and the absence of porosity cannot be claimed as a general proposition, said J. Longden. There must be a certain minimum line beyond which there is no reduction of porosity. It does not follow that the reduction of the silicon from 1.3 to 1.2 or 1.1 per cent and the addition of a certain percentage of nickel will reduce the porosity. He said he had recently cast a gear blank without reducing the silicon but adding about 2 per cent nickel, he was sorry to say, porosity showed itself in the rim without any additional work by chilling.

R. F. Harrington, A. F. A., said he was a firm believer in the use of nickel for the purpose of removing internal shrinkage. He believed nickel had its definite application as suggested by Dr. Everest in that it prevented waste castings by providing a more uniform structure.

Adding Manganese to Cast Iron Advantageous

That further evidence has been published of the advantage of adding manganese to cast iron, especially in the case of thick sections, was appreciated by John Shaw. Nickel is being used by him for special purposes and he said that, in the case of cylinders for air compressors which had to withstand a pressure of 3000 lb., whereas with a specially refined iron bad results were obtained, the addition of 1 per cent of nickel enabled castings to be obtained which indicated no leakage under this test.

H. J. Young, speaking with regard to nickel, said he was recently at a meeting where there were some chief chemists and big founders and one man said he had put in ½ per cent to 1 per cent of nickel into his castings and had reduced his costs from 10s. to 5s. throughout his foundry. That sounded very good but another chemist from an equally large foundry said it was "all bunkum" and that he had used nickel but had not got rid of the wasters.

Definite Ratio of Manganese to Sulphur Advantageous

Thirty-three years ago, F. J. Cook said, he found that manganese caused hardness, and decided that if manganese were three times the sulphur with a maximum of 0.4, the sulphur being 0.12, and the manganese 0.4 per cent, the best results are obtained. If he got above or below that percentage of manganese there was a tendency to chill and a very definite tendency if he got above 0.4 per cent.

Nickel Will Not Make a Bad Iron Good

Dr. Everest, replying to the discussion on his paper, said we do not know very much about the influence of nickel in irons which are predominantly ferric but, if the combined carbon in an iron is such that the structure is pearlitic, then nickel can be used to advantage. There are cases in which the silicon is as high as 3 per cent in engineering castings and anything up to 2 per cent of nickel could be added effectively. He said he did not wish to put nickel forward as a cure-all. It will improve a good iron but it will not render a bad iron good.

With regard to wear tests, mentioned by Mr. MacPherran, the paper mentioned accelerated tests because in the laboratory there are no means by which the conditions of wear inside a cylinder, say of an automobile engine, can be reproduced. It is impossible to reproduce the conditions of lubrication, the correct bearing pressure, speed, oscillations, etc., and in the wear of cast iron the general experience is that any change in one of these conditions will totally alter the results. He believed that in certain cases nickel is effective in eliminating porosity but he would not recommend it for that specific purpose. The true benefit from nickel is the reduction of silicon. A great many claims are made for nickel based on the fact that the silicon is reduced and the nickel gives the necessary machinability.

In reply to Mr. Harrington, he said that the experiments had been carried out on piston valve liners for locomotive work and nickel had proved effective in eliminating porosity. In this country the average casting for that purpose would be centrifugally cast and the question of porosity would not then arise.

Mr. Harrington said he was glad Dr. Everest had pointed out that fundamentally the reason for improvement with the use of nickel was in the reduction of silicon but his own observations suggested that something more than that happened. There must be a change in the elements other than the silicon and he agreed that nickel could not be regarded as a cure-all. Dr. Everest said he did not agree with Mr. Harrington that there must be a change in the other elements than silicon and he knew of cases in which porosity had been entirely removed by the addition of nickel although he did not recommend nickel for the specific purpose of eliminating porosity.

Reviews of other papers and discussions will be published from time to time in later issues.

An account of the exhibition will also follow later.

United States Civil Service Commission announces an open competitive examination for a technical editor, at $3,500 a year, to fill a vacancy in the Bureau of Mines, Washington. Applications must be on file with the Commission at Washington not later than July 31. Full information may be obtained from the Commission, or from the Board of Examiners at the post office or customhouse in any city.

Industrial Activity Passing Peak

May Was High Month and Reaction Now Due—Supply of Commodities Exceeds Normal Demand

BY DR. LEWIS H. HANEY

DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

Favorable Factors

1. *Sustained employment and payrolls.*
2. *Improvement in retail trade.*
3. *High railroad freight traffic and earnings.*
4. *Large earnings and dividends by industrial corporations.*
5. *Machine tool orders at new high, considering the season.*
6. *Gold imports; strong Reserve Bank position.*
7. *Recovery in wheat prices; farm relief bill passed.*
8. *Absence of commodity price inflation.*
9. *Light mercantile inventories.*
10. *Strong financial position of most leading companies.*
11. *Reparations settlement; Mexican concord.*

Unfavorable Factors

1. *Member banks over-loaned; brokers' loans excessive; crisis money rates; bonds decline.*
2. *P-V line falls below normal, indicating supply in excess of demand.*
3. *Declining building activity affects cement, brick, lumber, plumbing fixtures, etc.*
4. *Declining exports, and unfavorable trade balance.*
5. *Reduced farm purchasing power, with agricultural prices considerably under a year ago.*
6. *Declining bank clearings.*
7. *Declining net demand deposits.*
8. *Automobile production lower, sales spotty, dealer inventories increased.*
9. *Total industrial production at peak levels.*
10. *Less favorable statistical position of oil, textile and copper industries.*
11. *Tariff uncertainties.*

CHIEF among the business barometer changes which have occurred during the past month are: Building activity resumed its declining trend, after a temporary April spurt; recession in this field is now generally recognized, and its effects are apparent in several important building materials. Employment and payrolls, though well sustained, show a tendency to round off; this is notably true of the index compiled by the National Metal Trades Association. There was a rather pronounced decline in net demand deposits at the reporting member banks, which often occurs near the peak of a period of business expansion. Overproduction of textiles and oil developed again, or became worse, and stocks of copper showed a considerable increase. The bond market resumed its gradually declining trend.

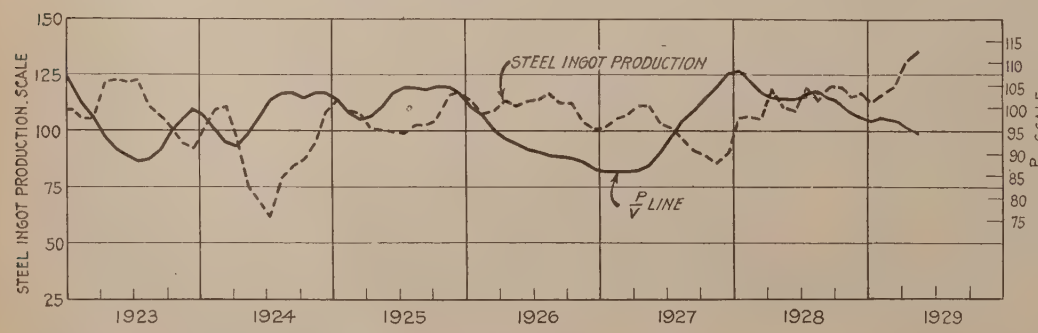
These changes are on the debit side.

Among the credits we find, first, an improvement in retail trade during May, accompanying better weather conditions. Grain prices recovered from the extreme low point to which they had fallen, and the passage of the farm relief bill without the radical debenture plan promises some ultimate good. At least, it removes a threat of harm. Commodity prices in general have become more stable. The settlement of the reparations question and the establishment of peace between the Mexican State and church are helpful long-range factors.

In other respects, the balance sheet remains unchanged. It is still true that business is very active and that the anticipated let-down is not yet definitely in sight. Perhaps the continued decline in bank clearings indicates the beginning of a slackening in trade. The automobile business, which has been so important, appears to be rounding off further. We note below some decrease in the volume of finished steel sales. But total industrial production and railroad car loadings continue at record levels.

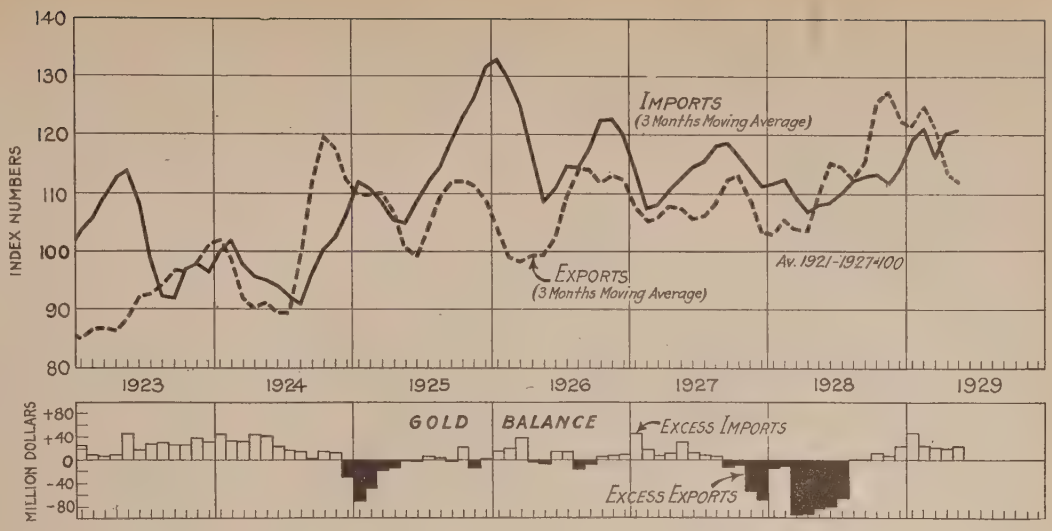
Barometers Indicate Approaching Decline

WE may conclude that business in May made a new peak, but that the gain was smaller than in preceding months, and that indications of the approach of some reaction became somewhat more evident. Among these indications, we would note the following: A very high ratio of bank loans to deposits, declining net de-

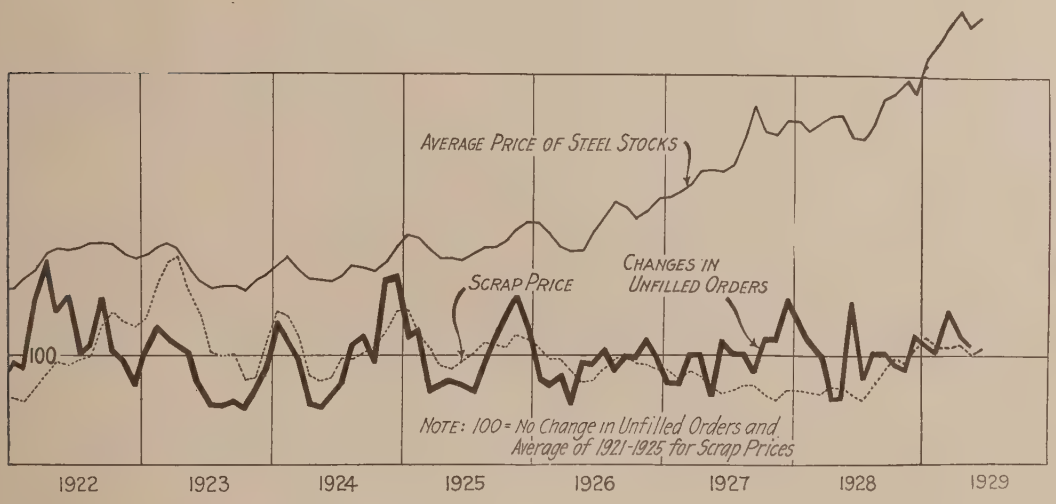


Downward Movement of P-V Line Has Now Carried It Below Normal. Steel production cannot much longer maintain its tremendous pace

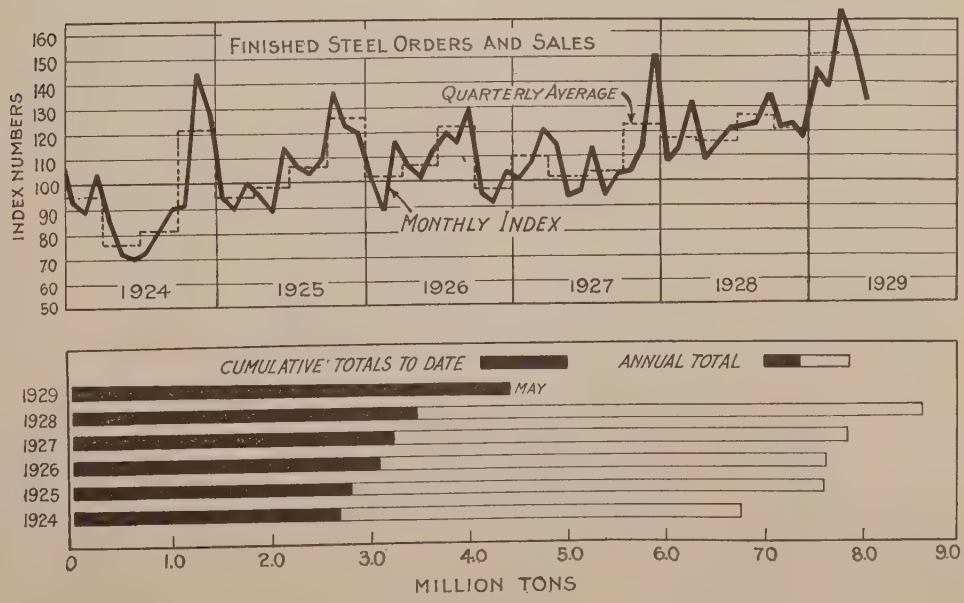
Imports, Which Are Regarded as a Good Index of Domestic Industrial Activity, Were Higher Than Exports in May, for the First Time in More Than Three Years. Gold movements are slight and contradictory



Unfilled Orders, While Still Upward, Showed a Smaller Gain. Stock prices have perhaps passed their high points and scrap prices, higher than for several years, are holding well above normal



Buying of Finished Steel Was Much Lower in May, But Higher Than for Any Previous May. The cumulative total is far ahead of any other year



mand deposits, crisis levels for money rates with the yields on stocks and bonds relatively low, high imports with declining exports, iron and steel production at abnormally high levels after a long period of rise, steel prices high in comparison with the general level (with the latter declining), and the fall of the P-V line below its normal level.

From the point of view of the business forecaster, each item in this list may be considered as more or less unfavorable in its bearing on the future trend of industry. To be sure, business forecasting is not sufficiently scientific to enable us to draw exact conclusions. To a considerable extent, we must rely upon analogy when we try to "catch the turns."

At present, however, analogies with conditions at the peaks of past business cycles are so strong that it is hard to escape the conclusion, either (1) that the course of business cycles has been changed or (2) that business activity is now near a peak. (We find such phenomena as the late run-up in copper prices followed by recession, the decline in wheat prices, the prevalence of mergers and large flotations of new stocks—all of which are often symptomatic of the approaching termination of a boom period.) It seems therefore that we should lean toward the latter conclusion, though we must recognize that definite forecasts as to the timing of business turns is highly uncertain, and the absence of inflation in business, together with the strong financial position of the Reserve Banks and our great industrial corporations, constitutes a sustaining factor.

Commodity Supply Above Demand

The P-V line (a ratio of commodity prices to the physical volume of trade) has now crossed normal on the decline. This we take to indicate that the general supply of commodities is distinctly above normal in comparison with the strength of the demand for such commodities. In the past, this development has usually indicated the approximate peak of the business cycle. In 1923, under similar circumstances, steel production (adjusted) held at the peak level for three months longer, or through July. In 1926 it held up for four months after the P-V line fell below normal, or through August.

Now it looks as though similar developments may be expected. After increasing in May, the ingot output has probably fallen off less than usual for the season in June and there is no reason to expect any large decrease in July. Present indications, however, suggest that production will decline more than seasonally by August at the latest.

Imports Exceed Exports in May

DECLINE in exports during May was listed above as one of the unfavorable factors. Considering the season, a recession in our total exports of merchandise has now been apparent for three months in succession. The same may be said of iron and steel exports. This is notable as fulfilling the predictions of economists that our high money rates, by curtailing foreign bond issues, would result in the decline in foreign trade.

Moreover, May imports increased, again considering the season, and were actually the largest for the month since 1920. This, of course, resulted in a so-called unfavorable balance of trade, which is the first monthly excess of imports over exports since April, 1926. It is the first time an unfavorable balance has occurred in May since 1923.

Finished Steel Sales Drop Sharply

PERHAPS it is significant that May sales of finished steel showed a relatively large decrease for a single month. While the decline may be partly attributed to a natural reaction from the record peak attained in March, the combined drop during April and May is the sharpest for the period since 1923, and the total sales for the second quarter are likely to be found further below the first quarter than in any year since 1924.

Sales of sheets and steel castings show declines considerably greater than usual for the season. Plates and structural steel sales made good increases, though not phenomenal ones. The total sales for May were the highest found in that month of any year on record. It seems fair to say, however, that a declining trend existed and that this is the more significant as the sales of sheets and castings are the most barometric of the various items included.

Speculation Holds Up Steel Shares

MEANWHILE, the common stocks of representative steel companies have shown a good recovery from the May decline. At this writing, they range all the way from 15 points below their old high levels of the year up to some which are at new high levels. The average is but little below the year's peak. The strength in steel stocks, doubtless, reflects large earnings which must be accruing from the active operations of the industry, together with a fairly satisfactory level of prices. As long as the renewed speculative interest is maintained, there is no reason to expect anything but strength in stocks.

Of course, no mechanical barometer is certain. Our rate-of-change index of unfilled steel orders, which often has been a good barometer of steel stocks, points downward. But it is still above the base line, which means that our adjusted index of unfilled orders is actually increasing. Steel scrap prices have recovered slightly thus far in June, though the movement continues to be one that may be called irregular and sidewise.

Taken together, the two barometers present no very clear picture. About all we can say is that they do not indicate a rise in steel stocks. Perhaps the conclusion may be that if the advances now talked of in speculative circles do occur, they will be based on speculative enthusiasm rather than on any new improvement in the steel outlook.

Iron and Steel Shipments to Be Heavy in Third Quarter

WASHINGTON, July 2.—Shipments of iron and steel products during the third quarter of the current year are estimated by Shippers' Regional Advisory Boards of the American Railway Association to amount to 519,419 cars, an increase of 10.3 per cent over the 470,873 cars shipped during July, August and September of last year. Estimates for machinery and boilers are 63,375 cars for the present quarter, an increase of 7.2 per cent over the 59,095 cars shipped during the corresponding quarter of 1928. Coal and coke shipments are expected to be 2,852,553 cars, or an increase of 14.6 per cent over 2,488,545 cars shipped during the third quarter of last year. The estimate for ore and concentrates is 914,863 cars, a gain of 7.7 per cent over the 849,732 cars shipped during the same quarter in 1928. For the 29 principal commodities dealt with, it is estimated that shipments in the current quarter will be approximately 9,816,948 cars, an increase of 632,287 cars, or 6.9 per cent, over the corresponding quarter of last year. The only regional boards of the 13 which estimated a decrease are the Southwest and Pacific Northwest, both of which expect only a small reduction.

Migration of Industry from City to Country

Among the trends noted by the National Bureau of Economic Research in its survey for the Committee on Recent Economic Changes is the shift of industry from city to country. Between 1918 and 1925, it is reported, the 25 largest cities in the country lost 326,800 wage earners, about 12 per cent of the average number employed. Cities between 100,000 and 250,000 population are said to have shown an even heavier loss, while during the same period the rural area is said to have gained 55,204. Increased manufacturing activity in rural areas is reported shown in the East North Central, South Atlantic, and Pacific divisions.

The National Association of Power Engineers will hold its forty-seventh annual convention and power show in Chattanooga, Tenn., Sept. 9 to 13. This will be in conjunction with the National Exhibitors' Association. Eugene H. Schimpf of J. H. Allison & Co., Chattanooga, is chairman of the executive committee.

New Rates Will Increase Competition

Mileage Scale Expected to Alter Situation Between Various Steel Producing Districts—Whole Effect Still in Doubt

BY L. W. MOFFETT

WASHINGTON, July 2.—The whole effect on competitive conditions in the iron and steel industry from the decision of the Interstate Commerce Commission setting up an entirely new scale of rates on manufactured products throughout Official Classification territory can be definitely known only after the new rates become effective on Oct. 20, in the opinion of traffic experts here who have followed the proceeding.

There is a consensus of view that the new scale will bring about greater uniformity, and that as a result there will be sharper competition in markets equidistant between producing centers and at points to which rates have been increased from one producing center and decreased from another.

Representative of the situation as it applies to so-called equidistant markets between Chicago and Pittsburgh are consuming destinations in Ohio. Under the existing rates the advantage for the most part rests with Chicago mills, but under the new scale it will swing in some instances to Pittsburgh mills while giving the latter a parity which does not now prevail, or more nearly approach a level with the Chicago district.

The present Chicago-Toledo rate is 26c., and it will be reduced 2c. to 24c., while the present Pittsburgh-Toledo rate is 26.5c. and it will be decreased by 3.5c. to 23.5c., thus changing the advantage to Pittsburgh by 0.5c. as against its present disadvantage of 0.5c. The Chicago-Cincinnati rate will remain at 27c., while the Pittsburgh-Cincinnati rate will be reduced from 28c. to 26c., a cut of 2c., so that the 1c. higher rate from Pittsburgh now prevailing will be changed to an advantage of 1c. To Deshler, Ohio, the rate from Chicago will be reduced 1.5c. from 26c. to 24.5c., while the rate from Pittsburgh will be reduced 3.5c. from 26c. to 22.5c., again turning a disadvantage for Pittsburgh into an advantage.

Because fifth-class rates generally, though not entirely, existent as to iron and steel products in Official Classification territory apply from East St. Louis to many important Indiana markets, while Chicago rates to these Indiana points are based on the Jones & Laughlin scale, but actually carrying rates below the scale, the new scale will narrow the spread to these points by 3.5c. to 7c. for 100 lb. in favor of East St. Louis. This is brought about by the fact that the scale to these Indiana points will mean reduced rates from East St. Louis and increased rates from Chicago. Illustrative of the changed condition that will result is the fact that the East St. Louis-Vincennes rate now is 23c., or 1c. higher than the Chicago-Vincennes rate of 22c., but under the new scale the rate from East St. Louis will be lowered by 4c. to 19c., while the rate from Chicago will be increased by 1.5c. to 23.5c., thus removing the present disadvantage of 1c. against East St. Louis and turning it into an advantage of 4.5c.

Effect of Long-Haul Reductions

The new scale manifestly reduces rates on long hauls, for the most part, and while the vast bulk of iron and steel shipments does not move in excess of 300 miles, there was much striving on the part of Middle Western mills especially to get lower rates on hauls beyond this distance. A striking example of the change the new scale will bring about for long hauls, and it is typical of a rather general situation, concerns rates from Pittsburgh and Buffalo to Lynchburg, Va. At present the rate from Pittsburgh and Buffalo is the same, 38c. Under the new scale the rate from Pittsburgh will be reduced 6c. to 32c., while the rate from Buffalo will be unchanged. In this instance, the so-called long haul of 418 miles from Pittsburgh will take a lower rate, while the still longer haul of 597 miles from Buffalo will take the same rate. This emphasizes the fact that to say long-haul rates will be reduced is a generality, with notable exceptions, and at the same time it gives force to the view that greater uniformity, on a mileage basis, will be established.

Application of the fifth-class rates from Pittsburgh to important markets in the East and of commodity rates lower than fifth class from the Eastern steel producing points to these markets was the source of complaint by Pittsburgh manufacturers, and on the whole the latter will benefit by the new scale while Eastern mills will be in a less strong position as to those markets, yet this will not be uniformly true. For example, the rate of 22.5c. from Bethlehem, Pa., to Albany, N. Y., will be reduced 1c. to 21.5c., while the Pittsburgh-Albany rate will remain at 34c., thus increasing the advantage to Bethlehem. Breaking up of the New England blanket rate will work to the advantage of mills in eastern Pennsylvania and surrounding sections nearest to New England markets, while working to the disadvantage of

those farther removed. This situation will apparently have considerable effect on the so-called Philadelphia group, which the commission said was too wide.

Short-haul rates are sharply increased under the decision. But it is doubted that where the hauls are comparatively a few miles distant, as, for instance from Pittsburgh to nearby consuming centers, the competitive conditions will change. The mills being so close to the market, it is contended that producing plants at greater distances will be unable to break into such markets. On the other hand, it is maintained that the new and higher scale for these short hauls will mean more revenue for the carriers and this is one reason for the assertion of some traffic experts that the new scale will mean more revenue for the carriers, rather than less, as predicted by Commissioner Woodlock.

Scale May Wipe Out Cross Hauling

There are those who have said that broadly the tendency of the decision will be to further "localize" the steel industry, but this statement also is held to be subject to modification on the ground that where long haul rates are reduced the tendency will be to centralize and that the exact situation will not be known until after the new scale has been under operation long enough to give it a test. Those holding the latter view contend that abolition of the Pittsburgh basing system has not "localized" industry so much as many had predicted. At the same time they are inclined to think that the new scale will have a tendency to wipe out cross hauling to an important extent.

A feature of the decision that is of considerable importance is the fact that the commission declined to comply with suggestions of many shippers and of central carriers that minimum as well as maximum rates should be established. The commission pointed out that it had exercised its power to prescribe minimum rates rarely and only under special circumstances.

The railroads thus are given leeway, within reasonable bounds, to establish rates lower than those prescribed in the basic scale, but it is doubted whether they will avail themselves of this privilege to any extent, first, because to do so might rob them of some revenue, and, second, the granting of special rates in one district would only invite requests from shippers in other districts for similar concessions, and thus start all over again the circle of preferential rates.

The commission's paragraph is very specific on this point, and some traffic experts point to it as the most vital statement in the decision. The commission said:

"The prescription of an inflexible scale would result in a rigidity in the rate structure which is both undesirable and unnecessary. Nevertheless, it is clearly to the advantage of both carriers and shippers generally that a uniform system of rates once established should not be constantly threatened by the granting of concessions from the scale in favor of certain localities or particular traffic. And it is obvious that, if the rate structure herein prescribed is to fulfill one of its primary purposes, that of removing and preventing undue prejudice and preference, departures therefrom should be made only when there is important necessity therefor, and only when such departures can be fully justified under section 3 of the act." (Sec. 3 forbids giving undue preference or advantage to a locality, etc., and likewise makes it unlawful to subject a locality to undue prejudice or disadvantage).

—

Greater Use of Trucks and Water Forecast in Chicago

CHICAGO, July 1.—Chicago producers, in making an analysis of the decision of the Interstate Commerce Commission to establish mileage rates on iron and steel, find that the scale which is to become effective Oct. 20, will decrease rates from Eastern centers of production into the Illinois-Indiana territory and will increase rates on short hauls that fall within the district that local shippers claim is their natural territory and in which, they say, over 50 per cent of their iron and steel tonnage moves.

It is anticipated that the higher short haul rates may force the use of trucks and water where possible, thereby affecting the revenue of the carriers. It is computed by some that trucks will be used on hauls from Chicago to such points as Milwaukee, with savings of more than 50 per cent, as compared with the new mileage scale. The buyer will have the additional advantage that he will get more prompt service and save the cost of haulage from freight house or steam track.

Points of importance, as viewed by local shippers, are: That groups of origin, including switching territory are permitted when not exceeding 20 miles in width, but no destination groups are authorized. The decision permits groups of origin which are left to the carriers to establish.

An analysis reveals that the decision raises many short hauls ½c. over the mileage scale that was proposed late last year. The long haul rates are virtually unchanged. Twenty-three out of 31 rates are raised to that number of points of destination within a radius of 285 miles of Chicago. St. Louis, which is 279 miles from Chicago and 612 miles from Pittsburgh, will have rates lowered from Pittsburgh and raised

*Fifth class rates apply generally from East St. Louis to these Indiana points, while from the Chicago district group rates based on the Jones & Laughlin scale apply, but those established are actually under that scale. It will be seen that under the new scale, if literally followed, the spreads between East St. Louis and Chicago to these Indiana points will be narrowed from 3.5c. to 7c. per 100 lb.

from Chicago. The present rate from Chicago to St. Louis is 22c., and this will be raised to 25.5c. by the decision. The old rate from Pittsburgh was 40.5c., while the new rate will be 39c. on a point to point basis, or, as computed by some, 37c. if a group is permitted.

—

Pittsburgh Mills Look Upon Rate Decision Favorably

PITTSBURGH, July 1.—Although Pittsburgh district steel companies are generally inclined to view with favor the recent decision of the Interstate Commerce Commission prescribing a basic mileage scale of freight rates on iron and steel products in Official Classification Territory, a number of points remain to be settled before its effect on shippers in this territory can be fully measured. Insofar as the decision places Pittsburgh on the same basis as other steel producing centers with regard to freight rates, it is regarded as a victory by shippers in this territory. For the decision recognizes the principle of a definite mileage basis for freight rates which has long been urged by Pittsburgh companies and abolishes the so-called discrimination against producers in this district which they have sought to correct.

Several points in the decision remain to be settled, some of them of particular interest to Pittsburgh district shippers. The Pittsburgh origin group is criticized, but no definite remedy is suggested. It is the understanding here that the carriers must decide what disposition is to be made, and their action will be watched with interest. If the various steel producing points are placed on a strict mileage basis, companies located to the east and west of Pittsburgh will be penalized in their rates in one direction, while in the other direction they will enjoy lower rates than Pittsburgh.

Some Uncertainty as to Effects

Settlement of the shortest routes over which traffic can move will also prove important to shippers, as rather marked changes in mileages are expected to result. These mileages are now being computed and, until this work has been completed, traffic departments are not certain just how the new schedules will affect them.

The more or less general increase in short haul rates will not influence Pittsburgh companies particularly, as none of the old relationships will be disturbed. Also the rates prescribed are maximum rates and the carriers will not likely make them effective where possible loss of business might result or well defined movements be interrupted.

Changes in the rates from Pittsburgh to more distant competitive points were generally covered in THE IRON AGE last week. Lower rates to Atlantic seaboard points, notably Baltimore and Philadelphia, will be of particular benefit to Pittsburgh, while the lower Pittsburgh-St. Louis rate, coupled with a higher Chicago-St. Louis tariff, places Pittsburgh in a much better position to compete with Chicago in the St. Louis territory. The action of the commission is raising the carload minimum from 36,000 lb. to 40,000 lb. is also generally favored in this district.

—

Cleveland Mills to Gain Some Advantages

CLEVELAND, July 1.—The proposed changes in iron and steel freight rates will result in some advantage to Cleveland mills. These mills will be slightly benefited because of a greater reduction in the rate from Cleveland to Detroit than from other producing points to Detroit. Cleveland mills will also be benefited in the local market by the increase in rates from Youngstown to Cleveland. On the other hand, Youngstown mills will suffer as far as Cleveland market is concerned.

Rates to Detroit are reduced 3.50c. a 100 lb. from Cleveland, while the reduction to Detroit is 2.50c. from Pittsburgh, 3c. from Youngstown and 2c. from Chicago. Consequently Cleveland mills will have a net reduction of 10c. a ton in the Detroit rate, as compared with Youngstown, and 20c., as compared with Pittsburgh. The present rate from Pittsburgh to Cleveland is 19c. and from Youngstown to Cleveland 9.5c. This spread will be reduced materially by the decrease of the Pittsburgh rate to 18.50c. and by a 3.50c. increase of the Youngstown rate to 13c.

Valley Mills Must Absorb Higher Rates

As Cleveland is used as the basing point for steel bars, this advance will mean that Valley mills will be compelled to absorb a higher freight rate to sell their bar mill products in Cleveland. In addition, in selling sheets and other products that carry a Pittsburgh base, the Youngstown mills will be in a less advantageous position than heretofore, as compared with Pittsburgh, in selling steel in Cleveland. Cleveland mills claim to suffer from a relative disadvantage as compared with Pittsburgh and Youngstown in the Indiana, Illinois and western Ohio districts. This disadvantage will be eliminated in the new rates.

Owing to the great number of nonmembers of the Institute of Metals (British) who are anxious to take part in the Düsseldorf meeting of the institute, to be held Sept. 9 to 12, the council of the institute will meet specially on July 4 to consider applications for membership. Only members of the institute will be able to take part in the various functions in connection with the Düsseldorf conference, which will be very largely attended and is expected to be a great success. The institute is visiting Germany at the invitation of the Verein Deutscher Ingenieure and the Deutsche Gessellschaft für Metallkunde.

Tariff Views Are in Conflict

Widely Varying Testimony at Washington Hearings, Particularly on Manganese Ore—Pig Iron Producers Ask for $3 Duty

BY L. W. MOFFETT

WASHINGTON, July 2.—Hearings on the iron and steel schedule of the tariff before a subcommittee of the Senate Committee on Finance originally carried a list of approximately 120 witnesses, the largest for any of the schedules, and while the number is being pared down somewhat through the practice of having one or two present the common views of a greater number, it is improbable that the hearings will be completed before the end of next week.

This is due to the program announced by Senator Reed of Pennsylvania, chairman of the subcommittee, who explained that the hearings would not be continuous. They were begun on Wednesday of last week, ran through Friday, and were resumed yesterday, when they were postponed until next Monday, in the hope that they would be ended before the following Saturday. No hearings will be held on the latter day. There are about 75 witnesses still listed.

Testimony regarding schedules on raw materials, semi-finished and finished rolled products, however, has been practically completed. The iron and steel industry, which, for the first time, spoke through a single organization, the American Iron and Steel Institute, at the hearings before the Ways and Means Committee of the House, continued that practice before the Senate subcommittee. Had this not been done the length of the hearings would have been appreciably extended.

The steel industry's general position was explained by John A. Topping, vice-president of the institute, and chairman of the Republic Iron & Steel Co. Suggestions for specific changes in rates, phraseology, etc., were laid before the subcommittee by the institute's tariff representative, Thomas J. Doherty, while its request for removal of the duty on manganese ore was made by L. E. Block, chairman, Inland Steel Co., Chicago, and Dr. C. K. Leith, University of Wisconsin, Madison, Wis. The statements of Mr. Topping and Mr. Doherty were published in THE IRON AGE of June 27, page 1775.

The members of the subcommittee consist of three Republicans, Senator Reed, Senator Edge, New Jersey, and Senator Smoot of Utah, chairman of the Finance Committee, and two Democrats, Senator King of Utah and Senator Barkley of Kentucky. The three members who have consistently sat at the hearings, and manifested deep interest in the proceedings, as shown by the many questions asked and comments made, are Senator Reed, Senator Edge and Senator King. At brief periods Senator Barkley participated in the hearings. Senator Smoot, occupied with other hearings, has not attended the hearings on the iron and steel schedule.

High Spots of Metal Tariff Hearings

STEEL industry asks for free manganese ore. Domestic ore producers plead for higher duty to protect their industry.

Merchant pig iron producers urge increase in pig iron duty from $1.12½ to $3 a ton.

Uniform duty of ½c. a lb. on muck bars and bar iron valued at less than 2½c. a lb. requested.

Manufacturers of tool steel and other fine steels propose sliding scale of duties, based on values, with rates generally higher.

Forging Manufacturers' Association asks that duty of 6/10c. a lb. on axles and other forgings be increased to 2c. a lb.

Importers generally object to higher rates proposed in House bill, and in some instances want reductions instead. Particular objections voiced to alloys in steels, hollow drill steel, sheet steel piling and sponge iron.

House Bill Not Satisfactory

In a large measure the hearings are similar to those held before the House committee, though the Senate hearings show more intensity of views on both sides. It is evident that the House bill is not satisfactory to either side, except in a few instances.

Likewise, it is apparent that the Senate subcommittee is not satisfied with the House bill, and it may be expected that, if the majority views of the subcommittee prevail, the iron and steel schedule will be greatly changed. At the same time there is necessarily a division of opinion within the subcommittee, and this does not seem to be due entirely to its bi-partisan character. As to steel rates, it is conceivable, in the absence of specific evidence to the contrary, that the Republicans are in agreement and that their views were reflected when Senator Reed, in the course of questioning Mr. Topping, said that it may safely be assumed that rates on steel will not be decreased, though he did not indicate that they would be increased, as the institute asked, at least not to the extent requested.

Both Senator Reed and Senator Edge made it plain that they think the steel schedule requires considerable reclassification so that there will be more uniformity as to duties and paragraphs on products of similar or nearly similar values and of like stages of manufacture. An example of this position was expressed by both senators regarding such products as plates, shapes and bars, some of which are lumped with raw steel and semi-finished steel.

Favor Removing Manganese Ore Duty

Statements of Senator Reed and Senator Edge also indicated they are in agreement in favoring the removal of the duty on manganese ore and reduction of the duties on ferromanganese, tungsten ore, tungsten metal and tungsten scrap. It seems doubtful that this view is shared, at least wholly, by the other senators. Although their tariff views are about as far apart as the poles, it is believed that Senator Smoot and Senator King, the former a high protectionist, and the latter a low-tariff advocate, will oppose a reduction in the duty of 1c. a lb. on manganese ore, and it is the impression that Senator Barkley is in accord with Senator Smoot and Senator King. This apparently curious alinement may be attributed to the fact that Senators Smoot, King and Barkley represent States producing manganese ore, and there is a strong political sentiment back of the request of American producers of this ore for an increase in the duty, though an increase is held to be unlikely.

Senator Oddie, Republican, of Nevada, is the author of a proposed amendment increasing manganese ore duties, which is being earnestly supported by domestic producers and as strongly opposed by the iron and steel industry. There is also much political support from the West of the duties on tungsten ore and metal. The matter of a duty on ferroman-

ganese necessarily is related to that on manganese ore, and Senator Reed implied that if manganese ore were made free of duty that of 1⅞c. a lb. on ferromanganese should be reduced to ⅞c. a lb.

Senator Reed made this suggestion when John J. Howard of the Lavino Furnace Co. was on the stand, and went further when Nelson B. Franklin, Washington, mining expert, was before the subcommittee and asked to justify the duty of 50c. a lb. carried in the House bill on tungsten ore, an increase from the present duty of 45c. Senator Reed said that, though he is a high protectionist, he is inclined to reduce duties on tungsten ore, tungsten metal and tungsten scrap, the latter given a duty of 72c. a lb., tungsten content, as against the general steel scrap rate of 75c. a ton.

When Dr. J. A. Mathews of the Crucible Steel Co. of America was before the subcommittee, Senator Edge indicated some of his tariff views, after explaining, as Senator Reed did, that he, too, was a high protectionist.

"Industries Encouraged without Result"

"Raw materials, such as manganese, tungsten and others, were given duties to see if it were possible to encourage their commercial output," said Senator Edge. "We have had seven years to try out the experiment. It is now proper to ask whether it has been successful." In the case of manganese and tungsten, he added, they have not been produced in quantities to meet domestic needs.

"We have been encouraging these industries without any result," interjected Senator Reed. "Do you not think it time to end that experiment?"

Dr. Mathews said that he was not in favor of wiping out these duties. On the contrary, he felt that domestic industries producing these raw materials should be encouraged.

It was during the course of Mr. Doherty's testimony that Senator Reed expressed the view shared by Senator Edge, and perhaps other senators of the subcommittee, that the steel schedule should be subjected to considerable reclassification. Senator Reed told Mr. Doherty that he was very much impressed by the lack of symmetry in the paragraphs covering plates and shapes and previously he had commented on a similar condition as to other paragraphs. In commenting on the paragraphs covering plates and shapes, Senator Reed pointed out that they represent the same degree of manufacture and carry approximately the same prices, yet plates take higher duties and are imported in much smaller quantities than shapes.

"It would seem," said Senator Reed, "that either the duties on plates are too high or those on shapes are too low."

Mr. Doherty expressed the opinion that one important controlling factor was demand in the domestic market.

Domestic Manganese Ore Producers and Steel Makers at Odds

AS had been anticipated, the most vigorously contested item was manganese ore. The subcommittee showed an unusual interest in the subject, evidently being aware of the wide difference of views existing between the steel industry on the one hand and domestic manganese producers on the other. Steel manufacturers asked that the duty be removed entirely. Domestic manganese producers asked for an increase in the duty, the latter favoring the amendment proposed by Senator Oddie providing for a duty of ½c. a lb. of contained manganese of 10 per cent to 20 per cent metallic manganese; 1c. a lb. for 20 to 25 per cent manganese and 1½c. a lb. for 25 per cent and more manganese. The present duty is 1c. a lb. of contained manganese in excess of 30 per cent.

The lively interest manifested in the subject was indicated by the fact that 13 witnesses had been listed to appear, although through the consolidation of common views the list was reduced somewhat. Broadly, the contest was between the American Iron and Steel Institute, as representative of the domestic steel industry, and the American Manganese Producers' Association.

Speaking on behalf of the institute and the industry generally were L. E. Block, chairman, Inland Steel Co., Chicago, and Dr. C. R. Leith, University of Wisconsin, Madison, Wis., consulting geologist, who also spoke for Feodore E. Foss, Wheeling Steel Corporation, Wheeling, W. Va. Others who asked for removal of the manganese ore duty were R. T. Caldwell, American Rolling Mill Co., Ashland, Ky., and Percival Chrystie, Taylor-Wharton Iron & Steel Co., High Bridge, N. J. These witnesses also asked for a reduction in the duty on ferromanganese, the institute seeking a cut to 25 per cent ad valorem.

The position of domestic manganese ore producers was laid before the subcommittee by J. Carson Adkerson, president, American Manganese Producers' Association, Washington, and several others.

It was contended by the steel interests that there are no high grade manganese deposits of importance in the United States, that promises of the domestic producers to develop processes for the manufacture of high grade material from low grade ores on a commercial and reasonable price basis had not been fulfilled and give no indication of being fulfilled, and that the duty is an unnecessary burden on consumers.

In direct contrast, domestic manganese producers maintained that processes for the beneficiation of low grade ores for the production of standard ferromanganese on a commercial basis at reasonable prices are being developed, enormous deposits of material which can be treated for this purpose exist and have been discovered, and some plants now are making high grade ore, and if given further protection the domestic producers will be able to supply the domestic requirements satisfactorily.

Steel makers asked for the conservation of such supplies as exist in case of necessity in times of emergency. Manganese interests on the other hand asked for added protection in order to develop any industry which will be able to supply necessary requirements in times of emergency. Senator Oddie submitted a brief in support of his amendment.

Appearing for David Taylor & Co., importer, Denver, Colo., former United States Senator C. S. Thomas protested against the House bill increasing the duty on tungsten ore from 45c. to 50c. a lb. of tungsten content. He said that no duty that Congress might place on tungsten ore will increase domestic production. He also opposed the House action in reclassifying tungsten scrap, giving it a duty of 72c. a lb. of tungsten content in excess of 0.2 per cent. The committee, including both Senators Reed and Edge, also seemed to think the increase on tungsten ore and tungsten scrap was not justified and called Nelson Franklin, Washington, mining expert, to explain the reason. He said that the duty of 50c. on the metallic content of tungsten ore represented a specific duty of a little over $500 on the 47.5 per cent grade. The duty would work out at $532, due to the difference in costs in China and the United States.

"I am a high protectionist," said Senator Reed, "but my inclination is to reduce the duties on tungsten ore, tungsten metal and tungsten scrap."

"If you do," said Mr. Franklin, "the price will go out of sight." It apparently was the view of Mr. Franklin that domestic production would cease if duties were lowered, leaving the country dependent solely upon foreign material.

Importers Voice Protests

Fred Truempy, Truempy, Faesy & Besthoff, New York importers, protested against the separate classification of silicon aluminum, aluminum silicon, alsimin, ferrosilicon aluminum and ferroaluminum silicon, providing a duty of 5c. a lb., and said that these items should be included under the section providing a duty of 25 per cent on all alloys used in the manufacture of steel or iron. He was especially critical of the duty as it affects alsimin, which was given a

higher classification by a Treasury decision and then written into the house bill.

M. K. Tholand, Ekstrand & Tholand, New York importers, protested against sponge iron being classified with muck bars, and being given a duty of 3/10c. a lb. He said the old rate was 30 per cent, but that sponge iron ought to be classified with and given the same duty as pig iron. There is no commercial production in the United States, but he admitted steel companies of the United States are experimenting with sponge iron with a view to getting into production. His firm imports the product from Sweden.

Pig Iron Producers Ask for $3 a Ton Duty

MERCHANT blast furnace interests asked for a duty of $3 a ton on pig iron. A plea for this rate was made before the House Committee on Ways and Means, but the House bill provided for a duty of $1.12½, which has prevailed since March 25, 1927, when by presidential proclamation it was increased by 50 per cent under the flexible provision of the Fordney-McCumber law. Contention was made by merchant producers that this duty is not sufficient to meet competition from abroad, which was said to affect Eastern furnaces most vitally, but to reach back to furnaces in the Middle West.

Pig iron makers in the central and adjoining sections of the country were represented before the subcommittee by Colonel F. B. Richards of the Hanna Furnace Co., Cleveland, while Eastern seaboard manufacturers and others presented their case through John W. Logan, Alan Wood Steel Co., Conshohocken, Pa., who indorsed the request of Coloned Richards for a duty of $3.

Colonel Richards was questioned closely by Senator King, Democrat, of Utah, as to domestic production and imports, earnings, consolidations, etc., who sought to bring out the point that incoming shipments were extremely small when compared with domestic output. Making a distinction between iron in pigs, such as that produced by merchant furnaces, and pig iron, made by steelworks stacks for consumption in the molten state, Colonel Richards explained that the tariff deals with iron in pigs sold by merchant furnaces and in some instances a small part of the production of a few of the steel companies which is sold in the market.

Colonel Richards said that, of the total production of 37,401,638 tons last year, 25,924,323 tons was used by steelmakers in molten condition, while 3,753,649 tons was iron in pigs for makers' own use and was the accumulation of iron made by blast furnaces and was available in the open market. Importations, he said, were 441,425 tons in 1925; 445,773 tons in 1926; 132,568 tons in 1927 and 140,694 tons in 1928. Between 91 and 92 per cent of these importations, it was stated, were landed at Northeast Atlantic ports from Philadelphia to Boston and in this area, served by furnaces in New York, Pennsylvania and Massachusetts, there is an approximate melt, when the foundries are running, of about 2,000,000 tons of iron in pigs. This territory, it was said, is where foreign competition is most severe. Explanation was given of prices over a period of years and differences in costs of production in the United States and abroad, the latter, as shown by a report of the Tariff Commission averaging in 1924 $7.16 under domestic costs. The countervailing duty against iron from India and the anti-dumping order against German iron brought about reduction in importations in 1927 and 1928. Neither of these penalties now applies, and Colonel Richards told the subcommittee that domestic producers are now in the same position as in 1924, and, "with reparations settled, from now on we may expect the keenest competition from German iron."

Cannot Keep Out Indian Iron

"We cannot hope, with a $3 duty, to keep out the iron from India, as they have a surplus of about 250,000 tons, part of which is bound to come to the United States, but as their product is widely distributed we are hoping the amount sent to the United States will be only a reasonable percentage of this surplus," said Colonel Richards.

"We may also expect competition from the Dutch furnaces, which have been built within the past few years, and in a short time they will have four modern furnaces. There is very little fabrication in the manufacturing field in the Netherlands, and the production of the four furnaces will be shipped abroad. As we understand it, these furnaces were largely financed by the cities of Amsterdam and Rotterdam, which use the gas produced by the by-product ovens.

"At the present time there is a measure of prosperity, and we are getting more for our iron. There is a shortage of pig iron in England, so it is reported, as well as coke, and the Germans and Dutch are shipping large tonnages to Great Britain. So far as one of these countries is concerned, the $1.12½ duty provided in the House bill is approximately no protection at all, and we have every reason to believe that they will use every effort, with reparations settled, when necessary in the future to again invade New England, New York and Pennsylvania markets with 400,000 to 500,000 tons of pig iron a year, which they can easily do under the present tariff, and force our prices down again to a point where we have tremendous losses in the manufacture of our iron."

Colonel Richards said that internal competition will keep prices in this country for many years to come entirely within reasonable bounds and the purchasers of pig iron will not in any way suffer by reason of the tariff asked for.

Compares Costs Here and Abroad

India, Netherlands, and Germany were said to have efficient plants, many of the furnaces in Germany having a capacity of 800 tons of pig iron a day. To build a furnace of this capacity in the United States at this time, including by-product coke ovens and power plants to use the waste heat from the furnaces, would cost over $8,000,000, the subcommittee was told. Colonel Richards said that it has been stated by an engineer, who made the appraisal of the plants which formed the United Steel Co. in Germany, that they could be reproduced with 45 per cent of the capital required in the United States.

Figuring the capital charge at 5 per cent and depreciation at 7 per cent, the American blast furnace today, it was pointed out, would have to face, as a capital and depreciation charge, $960,000 a year, and this, on a production of 292,000 tons of pig iron, would be $3.28 a ton. Figuring the German outlay in the same way, taking the capital charge at 5 per cent and the depreciation charge at 7 per cent on the same tonnage, it was stated, would mean a cost of $1.48 per ton on this production. The labor, supplies and all costs at the American furnace were placed at $1.50 per ton and at the German furnace 76c. per ton. This would make the capital and depreciation charges and costs, without figuring any interest on any other overhead, and not including general insurance, $4.78 per ton for the American furnace and $2.24 per ton for the German furnace, which, it was pointed out, would give an advantage to the German built and operated furnace of $2.54 per ton on capital and depreciation charges and labor, Colonel Richards said, explaining that he was assuming that the cost of shipping iron to New York City from the German furnaces, including any rail, freight and ocean carrying charges, would be about 17 shillings, or about $4.25 and even less. The open quotations, f.o.b. vessel channel ports today, it was stated, are $15.76 and the transportation about 12 shillings, or roughly about $3, making an open quotation delivered New York $18.76, without duty.

"We are paying to the railroad companies double the freight on all materials to be assembled, as well as on the finished products going out, as against the freight of 1913," Colonel

Richards said. "We are paying from two and one-half to three times more for labor than is paid in European countries, while the wages in India, we understand, run from 14c. to 16c. a day. The freight from Buffalo to the metropolitan district of New York and New England is $4.91 a ton. Iron can be transported from Holland to Atlantic ports for only 16c. a ton more than the present rate from Philadelphia to Bridgeport, Conn., the respective rates being $3.81 and $3.65 per ton.

"In November a cargo of about 3700 tons of Indian iron was received in Philadelphia and the customs invoice was sworn to at $12.61 a ton. It costs about $5.03 a ton to bring this iron from Tata, India, through Calcutta and deliver it in New York harbor. Recent reports from India show that they have reduced their costs from $13.36 per ton, as found by the Federal Tariff Commission in 1924, to $9.76 per ton at Tata, India, and it is owing to this fact that we make the statement that a duty of $3 a ton will not keep out Indian iron."

Merchant Furnaces Losing Money

Colonel Richards submitted a consolidated statement showing net losses of 32 merchant furnaces extending from Chicago to east Atlantic ports, for 1926, 1927 and 1928, the figures being $1,085,818.39; $2,751,832.92 and $1,241,189.13 respectively. On the other hand, Colonel Richards said, the most recent earnings of the iron and steel industry show that on a capital of about $39,000,000,000, it earned 5.71; on average shares of common stock, $10.58 per share and on book value, 5.41 per cent. These figures were said to include losses in the statement relating to the merchant blast furnaces. The companies for which he appeared were the St. Louis Gas & Coke Corporation, Granite City, Ill.; Federal furnaces of By-Products Coke Corporation, Chicago; Zenith Furnace Co., Duluth, Minn.; Toledo Furnace Co., Toledo, Ohio; Adrian Furnace Co., DuBois, Pa.; Davison Coke & Iron Co., Shenango Furnace Co. and Reliance Coke & Furnace Co., Pittsburgh; Marting Iron & Steel Co., Ironton, Ohio, and the Hanna Furnace Co., Cleveland.

Testimony of a similar character was presented by Mr. Logan, who said that Eastern seaboard merchant furnaces were the hardest hit by imports. Pig iron, he said, needs and is entitled to a duty in line with that on its products, which were said to have protective duties as high or higher than those existing when pig iron had a duty of $2.50 a ton. Almost 80 per cent of the entire production of pig iron in the United States was said to be made by steel companies for their own use.

Mr. Logan appeared for the following producers: Mystic Iron Works, Boston; Witherbee, Sherman & Co., Port Henry, N. Y.; Hudson Valley Coke & Products Corporation, Troy, N. Y.; Chateaugay Ore & Iron Co., Lyon Mountain, N. Y.; E. & G. Brooke Iron Co.; Birdsboro, Pa.; Colonial Iron Co., Riddlesburg, Pa.; Delaware River Steel Co., Chester, Pa.; Reading Iron Co. and Thomas Iron Co., Reading, Pa.; Alan Wood Steel Co., Conshohocken, Pa.; Pulaski Iron Co., Pulaski, Va.; Roane Iron Co., Rockwood, Tenn.; Central Iron & Coal Co., Holt, Ala.; Sloss Sheffield Steel & Iron Co., Birmingham, Woodward Iron Co., Woodward, Ala.; Columbia Steel Corporation, Provo, Utah.

Asks Higher Duty on Bar Iron

A uniform duty of ½c. a lb. on muck bars and bar iron valued at less than 2½c. a lb. was asked for by Charles Hart, Wrought Iron Co. of America, Philadelphia. The House bill, which made no change in muck bar and bar iron duties, provides 2/10c. a lb. when the value is not over 1c.; 3/10c. a lb. when valued at 1c. and not over 1½c., and 5/10c. a lb. when valued above 1½c. and not above 2½c. Mr. Hart said that imports of bar iron come into the United States at less than the American prices and affect the domestic market adversely. He said bar iron producers are also affected by imports of steel bars. He approved of the action of the House in specifically naming sponge iron and placing it in the muck bar and bar iron paragraph. He said that sponge iron competes with muck bar and is made in Sweden.

Wants Lead Duties Raised

George E. Collins, Denver, appointed by a committee of the Colorado State Legislature, the first witness before the subcommittee, asked for an increase of 33 1/3 per cent in the present tariff rates on lead ores, lead products and metallic lead; for a duty of 1½c. a lb. on zinc ore, regardless of its metallic content, and for an increase of 50 per cent in the duty on tungsten ore.

Tool and Fine Steel Makers Suggest Sliding Scale

APPEARING on behalf of the tool and fine steel industry Dr. J. A. Mathews, Crucible Steel Co. of America, asked for a sliding scale of rates as the values increase. These products coming under paragraph 304, carry a flat rate of about 20 per cent, and Doctor Mathews said this rate does not take into consideration the fact that higher prices represent greater labor costs on a given unit of material. For that reason he asked that the duties progress upward with prices. The scale he proposed ranges from 20 per cent to 35 per cent on carbon steels valued at over 16c. a lb. The subcommittee was told that about 34,000 tons was imported in 1927 under paragraphs 304, 308, 313, 315 and 316, and that it was all material that would resell in the United States at 5c. a lb. or higher, thereby bringing it into the category of tool and fine steels.

Tonnage producers, he said, are interested in imports valued below 2½c. a lb., such steel representing more than 99 per cent of the domestic production, while tool and fine steels represent 0.5 per cent in volume. At the end of the war, Doctor Mathews declared, about 40 plants were making tool and fine steels. Eleven of those were declared to have gone out of business and most of them have been scrapped. Two other companies were said to have undergone two complete reorganizations with loss to the stockholders and one was said to have undergone one reorganization. The Crucible Steel Co., Doctor Mathews said, has dismantled one plant and closed down another.

Dealing with paragraph 304, relating to rates on carbon steel of a value of 2½c. a lb. and upward, Doctor Mathews urged the following changes:

Valued at 2½c. and up to 3½c. a lb. from 8/10c. to 1c. a lb.

Valued at 3½c. and up to 5c. a lb. from 1c. to 1½c. a lb.

Valued at 5c. and up to 8c. a lb. from 1 7/10c. to 2 4/10c. a lb.

Valued at 8c. and up to 12c. a lb. from 2½c. to 3 6/10c. a lb.

Valued at 12c. and up to 16c. a lb. from 3½c. to 5c. a lb.

Valued at 16c. a lb. from 20 to 35 per cent ad valorem.

The additional rate, "Provided that on steel circular saw plates, etc.," from ½c. to 1c. a lb.

Insertion of the words "seamless tubes" be made in provision for hollow bars, and hollow drill steel valued at more than 4c. a lb., and House bill duty of 1 3/10c. a lb. be increased to 2c. a lb.

In paragraph 307, rates on plates, valued at over 3c. a lb., increase from 20 to 35 per cent.

In paragraph 308, covering high grade tool and fine steel sheets valued at 3c. a lb., increase from 20 to 35 per cent.

In paragraph 313, last clause, covering "bars and strips of iron and steel in either long or short lengths not especially provided for," increase from 25 to 35 per cent.

In paragraph 315, on material valued at over 4c. a lb., which the House bill increased to 20 per cent, increase further to 35 per cent; increase additional of ¼c. on material "tempered, treated or partly manufactured" to ½c. a lb.; increase additional duty of ⅛c. on "cold-rolled, cold-drawn, cold-hammered or polished in any way," etc., to 1c. a lb.; increase additional extra duty of 2/10c. on "blued, brightened, tempered or polished" material to 5/10c. a lb.

In paragraph 316, increase duty on wire, valued at 6c. a lb. and over to 35 per cent.

Representing the Southern Tariff Association, George W. Armstrong, president of the Texas Steel Co., Fort Worth, Tex., resumed a plea made before the House Committee on Ways and Means for a duty of 1c. a lb. on

iron and steel bars, including reinforcement concrete grades. He also was of the opinion that all bars should be included in a single paragraph. Senators Reed and Edge said that they thought not only bars but plates and other products should be reclassified so that there would be greater uniformity as to the processed condition of the products, ranging from raw to semi-finished to finished material.

Importer Asks for Changes

George E. Dix, New York importer, president, Steel Union Co. and Sheet Piling Co., Inc., approved of the House bill providing a definite classification for rolled interlocking steel sheet piling in the structural paragraph and continuing the duty at 1/5c. a lb., and protested against the recommendation of the American Iron and Steel Institute for a duty of 5/10c. a lb. He asked that deformed or concrete reinforcing bars, specifically mentioned in paragraph 304 in the House bill and made dutiable at $6 a ton, be restored to the structural paragraph, 312, and given a duty of $4 a ton. Request also was made for changes downward in the duties on ordinary plates, baling buckles, bale ties and woven wire netting. Because they sell for the same or almost the same price as structural shapes, he asked that plates take the same duties as shapes.

In accordance with this suggestion he asked that paragraph 307 be changed and that a duty of $4 per net ton or 20c. a 100 lb. be fixed on tank plates, universal mill plates, ship hull steel plates, plates meeting standard specifications for structural steel and other plates valued at 2c. a lb.; for plates valued at over 2c. a lb. and not over 2½c. a lb. a rate of $5 per ton, or 25c. a 100 lb.; for plates valued above 2½c. a lb. up to 3c. a lb., $6 a net ton, or 30c. a 100 lb.; for plates valued at over 3c. a lb., $10 per net ton or 5/10c. a lb. He said that it is on the ordinary plates of structural or tank grade that are of no special analysis and which require no excessive extras or price that the duty of $10 per net ton appears to be excessive and burdensome.

It was declared by Mr. Dix that the schedule suggested would permit some importations of plates, especially in localities where foreign freight rates were advantageous, and where prices are now high because of the long inland freight haul from manufacturing points.

Wants Changes on Hoops, Bale Ties

Taking up paragraph 314, Mr. Dix called attention to the fact that it permits the importation of hoops and bands, cut to length, with or without buckles, for baling cotton or other commodities, the duty being 1/4c. a lb., and he asked that the paragraph be so clarified that buckles and fastenings for baling ties may be admitted at the same rate of duty as when shipped together with the hoops or bands. In the majority of cases, it was stated, buckles or fastenings are shipped with the bands or ties, but occasionally the buckles are forwarded in separate shipments, and, when that occurs, under the decisions of the Customs authorities, paragraph 399, covering "articles not specially provided for, 40 per cent ad valorem duty" is the paragraph under which the material is admitted. Mr. Dix said it would appear clearly to be the intention of Congress to admit not only the hoops and bands, but the buckles and fastenings as well.

Pointing out that the last two lines of the paragraph read, "All wire commonly used for baling hay or other commodities, ½c. a lb.," Mr. Dix said that under the ruling of the Customs division it is impossible to import wire for baling hay, for the reason that there is nothing in the nature of the wire itself, or the manner in which it is supplied, to identify ordinary wire for use in baling purposes and that therefore this portion of the paragraph is ineffective. He suggested that the paragraph be changed to read "All wire commonly used for baling hay or other commodities and all wire bale tie, ½c. a lb." A bale tie, he said, consists of a straight length of the wire with a loop twisted at one end, but under the ruling of the appraisers this is classified under paragraph 399 as "articles or wares not specially provided for, if composed wholly or in chief value of iron or steel, 40 per cent ad valorem." It was declared to have been evidently the intention of Congress to allow baling wire and bale ties of wire which are used principally by the farmers, to "enjoy a reasonable duty of ½c. a lb. instead of 40 per cent ad valorem."

Request also was made that the committee include in paragraph 318, which covers woven wire cloth and fabrics of various kinds, a provision for woven wire netting composed of steel with an ad valorem duty of not to exceed 25 per cent, "in harmony with the rate of duty provided for the much finer products already included in paragraph 318." Mr. Dix said that failure to classify and specifically mention netting in the existing law has worked great hardship on the importers and users of this class of material.

Sheet Steel Piling Competition

In discussing sheet piling, Mr. Dix said that since the hearings before the Ways and Means Committee last February several striking examples of the competitive situation on this product have come up. On June 1, it was stated, there was a public letting at Palm Beach of a sea wall to be constructed of steel sheet piling of a total length of 7330 lineal ft. There were four bidders, Mr. Dix said, at the following delivered figures: Bethlehem Steel Co., $51.20 per net ton; Sheet Piling, Inc., offering Larssen piling, made by the United Steel Co., Germany, $50; Carnegie Steel Co., $49.20; Jones & Laughlin Steel Corporation, $47.50. The business, it was stated, was placed with Sheet Piling, Inc., despite the fact that it was the next to the highest bidder, the reason given by Mr. Dix being based "on the efficiency and strength of the piling section."

It was said that it is evident that there is no price advantage by which Larssen piling is adversely affecting the American market, and Mr. Dix added that there is no justification in the demand for an increase of duty. Rather, he urged, it would be more proper that the duty be reduced.

Proposes Increase on Forgings

Appearing for the Forging Manufacturers' Association, representing 85 manufacturers of forgings, G. H. Weiler asked that the duty of 6/10c. a lb. on axles, etc., be increased to 2c. a lb. and that crank forgings be specifically mentioned.

C. Frank Schwep, Ingersoll Rand Co., New York, opposed the House provision which specifically named hollow drill steel and gave it an additional duty of 1 3/10c. a lb. when valued at over 4c. a lb. above other products named in paragraph 304. Mr. Schwep said the proposed duty will either prohibit importations of hollow drill steel or place a burden upon the mining industry using rock drills. The House bill, he said, would increase the duty $60 a ton, and make it 3c. a lb. His company, Mr. Schwep says, imports hollow drill steel from Sweden, and he stated the reason the material was imported is that it is superior to the domestic product.

Objects to Alloy Steel Rate

Representing 16 importers who receive from 90 to 95 per cent of the incoming shipments of fine steels, W. D. Thomas, New York, strongly objected to the duty of 8 per cent on alloy steel and asked that it be reduced to 2 per cent. He protested also against the provision relating to determination by Customs authorities as to whether imports were or were not alloy steel. The point was made that the provision would be confusing and difficult of administration because of the difficulty of accurate analysis. He proposed instead specific duties on the alloy content. Retention of the 8 per cent duty in paragraph 305, he said, would impose three duties on alloy steels in addition to those on carbon steels. He also protested against the duty on cylindrical steel rolls.

Mr. Thomas said that importations of fine steels are less than 2 per cent of domestic production and that the imported material was higher in price, the claim being that it is superior in quality to American-made material.

Construction work was scheduled to be started on additions to two merchant mills of the Algoma Steel Corporation at Sault Ste. Marie, Ont. The improvements will cost $2,500,000 and are expected to be completed by Jan. 1 next. The additions will about double the capacity of the two mills and increase the finished steel production by about 50,000 tons a year.

Promising Markets for Sheets Disclosed

Conference of Flat Rolled Steel Executives Last Week Devoted to Trade Extension Work

MARKED increase in interest in trade extension work was evidenced in the meeting last week at White Sulphur Springs, W. Va., of the executives of flat rolled steel manufacturers. A three-day conference, with afternoons left for golf and other recreation, brought before the makers of steel sheets and hot and cold rolled strips two analyses of potential markets and concrete suggestions to cultivate them. It heard a carefully considered estimate of the trade extension problem by President James A. Farrell of the United States Steel Corporation. It focussed on the active movement among many industries to eradicate unethical and uneconomical commercial practices by agreements among the elements of the industry either under the auspices of the Federal Trade Commission or outside its influence. The note sounded in all the gatherings was one of satisfaction in respect to the progress made in trade extension and a steadfastness of purpose to carry on in a larger way if possible. Following are some of the high points of the conference.

Analyses of Rural and Urban Demands for Sheets and Strips

IN THE IRON AGE of last week, page 1784, were outlined the early features of the meeting. These included a farm market survey presented by Ray H. Griswold, of the Griswold-Eshleman Co., Cleveland. As explained last week this indicated a potential market in galvanized roofing alone of 1,600,000 tons against a present consumption of 429,000 tons, part of which is believed to go to towns and cities. Considerable emphasis was placed on the channels of distribution, with hardware stores in the premier place by a wide margin, and on the need of better compensation for the dealers, and on the highly receptive attitude of the farmers for steel products. Besides a formidable array of charts covering consumption and distribution studies, Mr. Griswold had a number of impressive exhibits of industry advertising, which he used effectively as follows:

One long panel was headed by the legend: "Shall I buy a product made of steel or a product made of—," immediately under it being the appeals of makers of products competitive with steel. These advertisements culled from various publications were bordered by a legend below to the effect: "The answer to this question must be made by the whole steel industry speaking as one voice." Another panel was entitled, "Today's business battle is being fought between industries not between firms," and below the advertising exhibit of companies extolling various materials was the injunction: "Steel mills should fight together for more of the consumer's dollars instead of fighting each other for his dimes."

It was pointed out that among the specimens of advertising were those of fabricators dilating more or less emphatically on the fact that steel entered into their products. The conspicuous illustrations of this class were advertisements of the General Electric Co., particularly of the company's electric refrigerator of which the all-steel character was advanced as a factor of prime importance. A letter from the company gave credit to the flat rolled steel makers campaign for stressing the idea of steel in its selling efforts.

Howard Spohn, of the Gardner Advertising Agency, New York, presented charts covering preliminary studies into the market possibilities of sheet steel and strip steel in the general field. They touched on steel furniture, shelving, steel lath (consumption of 110,000 tons a year against prospects of 569,500 tons), barrels, tote boxes, enameled wall tile, steel ceilings, roof decks (360,000 tons potential and 15,000 tons actual), doors and trim, steel industrial buildings, toilet and shower partitions, office and factory partitions, metal lumber, box and refrigerator cars, boiler jackets, trucks, etc.

Summed up, the two speakers left the impression that both the rural and urban markets presented broad fields for cultivation, the one measured in part by its annual creation of new wealth to the amount of 20 billions of dollars and the other as offering a 7-million ton consumption where now it takes but 535,000 tons. Both were convincing that manufacturing steel consumers are beginning to see the value of stressing steel as a point in selling. Also, as was mentioned in last week's account, it was urged that fabricators be induced to use slogans in their trade development work; the advertising of the flat rolled steel makers, as explained, is in part written around "save with steel" arguments in reaching the general buyer and around "galvanized steel protects" in rural campaigns.

Mr. Farrell on Trade Development

MR. FARRELL addressed himself to the same topic of trade development and his remarks substantially in full were as follows:

"The work of trade associations, properly performed, is useful. The American Iron and Steel Institute, since its inception, has endeavored to bring about friendly intercourse among its members, and cooperation in technical research, which have been of vast benefit during the 20 years of its existence. Any efforts designed to promote new uses of steel products or to expand their present usage, to assist both the manufacturing and consuming trade to a better understanding of the problems of initial manufacture and re-manufacture, are worth while.

"There has been an increased trend in recent years toward the formation of trade associations covering practically every line of manufacture and many commercial activities. It is said that there are some 15,000 of these associations in the United States. It is to be hoped that in their operations and ramifications the inhibitions imposed by our laws will be scrupulously observed.

"It is gratifying to note in this connection the helpful attitude of the Federal Trade Commission following further interpretations of the Sherman Law by the Supreme Court. The hearings which have taken place at the request of a number of these associations have no doubt served to clarify the limitations of these associations as to their methods of operation and permissible functions.

"It is obvious that the American Iron and Steel Institute can only serve as a general clearing house for the exchange of thought and plans for the benefit of the industry as a whole. It must be left to individual and company initiative, and the mutuality of efforts in respective lines of manufacture, to develop the respective interests of the several sections of the steel trade.

"There is a serious and important aspect, however, as to the extent to which the industry should actively participate other than in technical discussion and research. The border line of collaboration under the law, when such cooperation might be interpreted by the courts as restraint of trade, does not seem to have been

clearly defined. It is realized that one of the purposes of the Federal Trade Commission is supposed to be to clear up such mysteries; but it is not understood that their suggestions offer more than helpful aid to those seeking such assistance in formulating methods and plans to come within the law.

"Without wishing to discuss at this time the practical advisability of business associations seeking any measure of control under governmental auspices, in the expectation of having a mantle of legality enshroud its operations, it appears to some well informed observers that it is not essential or desirable to solicit that form of governmental intervention in business.

How Large Companies Can Assist

"Another trend of the times appears to be toward the merger or consolidation of manufacturers having collateral interests; and when these have been and can be accomplished legally, it would seem that the integration thereby made possible would serve in a large measure to accomplish the purposes of disintegrated organizations seeking through an association the solidarity in research and technical development which is economically beneficial.

"It would therefore remain for the larger companies with their effective bureaus of research, sales and advertising, to assist by every proper means the efforts of associates in similar lines of work to promote the common interest in the more intelligent use and distribution of their product. This assistance might well comprise through collaborative and cooperative efforts to accomplish a stabilization of practices, costs and compensatory returns on investment.

"It is felt that such reciprocal effort will enable the industry, with their facilities for the accomplishment of similar purposes, to develop every possible means of improvement to the industry, and in collaboration to stimulate and promote customer uses of product, with such exchange of data and result with associations of its competitors as may be found proper and expedient.

"It would seem that the units of the industry itself should have sufficient respect for each other's welfare voluntarily to refrain from unfair trade practices inveighed against by numerous associations which have sought the assistance of the Federal Trade Commission and by close observance of ordinary commercial ethics and reciprocal consideration.

An Industry's Excessive Claims of Superiority

"Remedies of any ills affecting our business are in our own hands. For instance, the orgy of excessive claims for the superiority of products differing but slightly, if at all, from those of other manufacturers, has assumed fantastic proportions. It incites competitive and expensive effort along similar lines by all competitors, with a mass of assertions and refutations which, in the end merely serve to confuse the mind of the buyer or promote harmful conflict among manufacturers. If this is intended to be a challenge as to the lengthiest pocketbook in advertising achievement and promotional publicity, the challenge will of course be met by the interests who naturally resent insinuations as to the superiority of competitive product or the inferiority of their own. It is in effect a form of salesmanship universally abhorred, of decrying the wares of a competitor, or vaunting unfounded or unprovable claims of excellence of products whose chief merit may be in the assumption of a peculiar or meaningless name.

"Possibly much of this competitive effort as been instigated by extraordinary pretentions of those who offer substitutes for steel and attempt to convince the public, and especially readers of literary journals, instead of readers of technical publications, which would seem to be the logical media for imparting technical information that the world has at last found what it has been waiting for.

"The only result from these claims is likely to be at the expense of the long-suffering industry, which has only recently emerged from the blight of over-capacity, under-consumption and meager profits. You can hardly term such effort as unethical, but rather as unnecessary and inadvisable. One of the best achievements which associations in the industry could accomplish would be to frown on illogical and unwise claims in selling policies.

"There is much to be said as to the advantages of association work to both makers and consumers in assisting toward proper publicity methods in refuting visionary suggestions of the superiority of substitutes; but much of this work would be minimized if the members themselves refrained from claims irreconcilable with the facts.

"Another boomerang to be averted, if possible, is the stimulation of unnecessary capacity through exciting ourselves over the prospect of more than a normal increase in annual average consumption consequent upon growing population and prosperity.

"There is a wide line of demarcation between normal and natural efforts to protect our industries and expand the use of their product along sane and normal lines, with due regard for the interests of others—and a scramble for business, with a heavy and burdensome budget of questionable utility, on the assumption of an unlimited increase in demand.

"There have been occasions in our industry when we were inclined to be more fearful than hopeful. At such moments we have felt that our business had fallen on parlous times; at such times the future of our industry was not pleasant to contemplate, but we recover quickly from moods of this sort. At present and for some time past we have had capacity operations. The indications are that we will have a reasonably full operation for some time to come. When business does slacken, we should act well and wisely. There is no reason why reasonable profits should not accrue on a less rate of operation.

"Until we have gained the wisdom, which we have not always had, of being satisfied with our normal share of the business going, we can do the industry incalculable damage and retard its normal development. We should by this time have attained that control of ourselves which will avert its misapplication to unbusinesslike methods and its resulting consequences. If we are seeking permanent economic factors they can be largely accomplished through cooperation."

Other Notable Addresses

The attitude of cooperation and general helpfulness now so conspicuous on the part of the Federal Trade Commission and its fostering of trade practice conferences were discussed at length at a banquet given by the association to members and guests on Monday, June 24, by the Hon. W. E. Humphrey, of the Federal Trade Commission.

Severn P. Ker, president, Sharon Steel Hoop Co., presided at the banquet and at the Wednesday morning session. The most important thing the steel industry has to do, said he, is to care for distribution. The executives today, in his opinion, are giving closer attention to distribution problems than at any time in the past, and he said there are signs of their desire to help industry as a whole. He regarded they had no other obligation than friendship for their associates and interest in the industry.

In introducing Mr. Farrell, he described him as knowing more of trade development than any one else. He referred to his efforts to export steel and how he proved able all alone to build up the export organization of the United States Steel Corporation two years after the formation of the corporation, resulting in a taking of 3,000,000 tons of steel off the American market and sending it to the world against low cost labor. Mr. Farrell, he said, is the undisputed chief executive officer of the greatest steel corporation of the world.

Among the notable addresses of the conference was that of George H. Charls, president of the National Association of Flat Rolled Steel Manufacturers. So well received was it that special requests were made from the floor that copies be made available for careful reading by all of the manufacturers, members and nonmembers alike. Those who entered into the discussion included C. R. Hook, vice-president and general manager, American Rolling Mill Co., Severn P. Ker, W. S. Horner, vice-president, American Rolling Mill Co., Walter E. Watson, Youngstown Sheet & Tube Co., F. C. Gifford, vice-president and general sales manager, Acme Steel Co., Chicago, A. N. Flora, of the association, Frank R.

Frost, of the Superior Steel Corporation, and others. What Mr. Charls had to say respecting trade extension is as follows:

Defines Rational Trade Extension

"Trade extension has been removed from the plane of intellectual abstractions and the sphere of the intangible. It has become a concrete, effective, recognized function of modern business.

"Cooperative trade development is no longer the abstract theorem among the problems of industry. It remains so only to those who willfully insist on remaining blind to its merit, or those who are frankly uninformed and unversed in its mechanism, operations and outstanding achievement.

"Collective trade extension has become a vital force for the protection of an industry and the preservation of its future. It not only extends the demand for the product of an industry, but it extends the very life of the industry itself.

"If charlatans have made it an abstruse affair, practical salesmanship and business ingenuity have unscrewed the inscrutable, exposed the hokum and vitalized the practical. It is no longer a speculative truth, that judiciously expended time and money in trade extension expands markets, but a fact which has been demonstrated.

"Regardless of the just criticism that vast sums of money have been wasted in misguided and misdirected efforts of trade extension, out of these mistakes have come a true knowledge of how to spend money judiciously to produce actual results in holding and creating new markets.

"In our industry, the responsibility of each and every corporation producing flat rolled steel to put its shoulder to the wheel, in our efforts to extend markets for our products, must be realized, appreciated and acted upon. Each must realize how effective he makes the whole by being a part of it—how doubtful he makes the plan by being out of it.

"If we are going to do this work in the biggest, most effective way, the industry expects every unit within it to do its duty.

"Our conception of trade extension advertising is to keep it on a purely educational basis and to hold it to the exploiting of the utility, beauty, weight saving, space saving, uninflammable nature of products made from steel and, most important, to make it a powerful force in influencing all fabricators of steel products and their distributers to increase their sales and advertising efforts, so that a $500,000 trade extension program on sheets, strip sheets, hot rolled and cold rolled, will bring about an expenditure of $5,000,000 among all those who buy the flat products—devoted to influencing the minds of 120 millions of people in favor of steel as opposed to competing products."

Eugene P. Thomas, vice-president of the United States Steel Corporation, in charge of sales, supplemented the speech of President Farrell by stating that the results of the extensive research work in progress by the Steel Corporation would be placed ultimately in the possession of the industry as a whole. He discussed also how the workings of the cartels and syndicates abroad, institutions not permissible here, had been helpful in promoting larger uses of manufactured as well as primary forms of steel, until the consumption of the non-manufacturing steel countries was last year 20 million tons, or 25 per cent more than in the preceding year, which year showed an increase of 13 per cent over its predecessor.

National Fuels Meeting to Be Held in Fall

Engineers interested in fuels, whether from the point of view of production or of utilization, will meet in Philadelphia, Oct. 7 to 10, under the auspices of the American Society of Mechanical Engineers. This will be the third National Fuels Meeting which that society has sponsored. Among the subjects to be covered are the following:

Economics of reclamation of anthracite culm.
Burning refuse fuels.
Low-temperature carbonization.
Atomic basis of combustion theory.
Economics of gas, coal and oil fuels.
Economics of oil production.
Heat value of fuel.
Coal pre-treatment.
Slag accumulations on boiler tubes.
Air needed for combustion of different fuels.
Design of furnace for tunnel kilns.
Development of refractories to meet needs of users.
Producer gas in brick kilns.
Burning pulverized anthracite.
Recent developments in stoker design (four papers).
Burning coarse coal in supension.
Proper methods of pulverized-fuel sampling.
Methods of recording smoke (three papers).

Refractories Institute Elects Officers

At the annual meeting of the American Refractories Institute on June 25, in Cleveland, the following officers and directors were elected: President, P. S. Kier, Kier Fire Brick Co.; first vice-president, W. B. Coullie, Harbison-Walker Refractories Co.; second vice-president, Roger A. Hitchins, General Refractories Co.; treasurer, C. C. Edmunds, McLain Fire Brick Co.; secretary, Dorothy A. Texter, Oliver Building, Pittsburgh.

Directors for the three year term 1929-1932: U. S. Clark, Howard Co.; G. R. McClintock, Osceola Silica & Fire Brick Co.; P. S. Kier, Kier Fire Brick Co.; E. F. Myers, Ironton Fire Brick Co.; J. Claire Evans, Denver Fire Clay Co.; J. T. Roberts, Stockton Fire Brick Co.; J. L. Green, Laclede-Christy Clay Products Co.; C. H. King, Evens & Howard Fire Brick Co.

New England Foundrymen to Meet at Taunton

The July meeting of the New England Foundrymen's Association will be held Wednesday, the tenth, at the Wampanoag Motor Club, Taunton, Mass. Following a luncheon, golf matches will be run off, and there will be a baseball game and other sports. The dinner in the evening will be informal. Luther Anthony, Glenwood Range Co., is chairman of the entertainment committee.

Industrial Conference to Be Held at Lake Geneva

The twelfth mid-western industrial conference will be held at Lake Geneva, Wis., July 18 to 21, inclusive, according to an announcement by J. A. Hiller, executive secretary of the conference, 19 South La Salle Street, Chicago. The 1929 program is planned for senior and junior executives and their representatives, and for the first time the labor group, which heretofore has been excluded from the conferences, will participate.

Westinghouse Agent Jobbers Elect Officers

Karr Parker, treasurer and engineering manager McCarthy & Ford, Buffalo, was elected president of the Westinghouse Agent Jobbers Association at its seventeenth annual meeting at Hot Springs, Va. Other officers named were E. D. Kilburn, vice-president Westinghouse Electric & Mfg. Co., vice-president; H. M. Gansman, vice-president H. C. Roberts Electrical Supply Co., Philadelphia, secretary; and H. T. Pritchard, merchandising department, Westinghouse Co., Mansfield, Ohio, assistant secretary and treasurer.

The following were elected members of the executive committee: A. E. Allen, vice-president Westinghouse Lamp Co., New York; Samuel Adams Chase, special representative Westinghouse Co., Mansfield; W. I. Bickford, president Iron City Electric Co., Pittsburgh; B. E. Finucano, general manager Rochester Electric Supply Co., Rochester, N. Y.; W. W. French, vice-president and general manager Moore Handley Hardware Co., Birmingham; M. C. Morrow, sales manager merchandising department, Westinghouse Co., Mansfield; T. J. Pace, director of sales, Westinghouse Co., East Pittsburgh, Pa.; J. C. Schmidtbauer, president Julius Andrae & Sons Co., Milwaukee; C. E. Stephens, northeastern manager Westinghouse Co., New York; N. G. Symonds, northwestern manager Westinghouse Co., Chicago; and Walter Williamson, vice-president and general manager Alpha Electric Co., New York.

New Automatic Chucking Machine

Hydraulic Feed Mechanism Applied to Both Platen and Automatic Indexing Turret Types

AN automatic chucking machine featuring hydraulic feed, has been brought out by the Foster Machine Co., Elkhart, Ind., under the trade name of Fastermatic. It is built in platen and automatic indexing turret types, each of which is available in four sizes, with 17, 22, 25½ and 33-in. swing over the bed, respectively.

Feeding of the tool-carrying units is actuated by a ram or piston inclosed in a hydraulic cylinder into which oil is forced by an Oilgear pump. The pump is located on the head end of the machine and is driven through silent chain from the main drive shaft. During the period of feeding, positive pressure is maintained on each side of the piston, the back pressure on the side of the piston opposite to that to which the feeding pressure is applied being necessary to maintain uniform feeding movement to the tooling when the cuts are intermittent or of irregular depth. These pressures are regulated automatically through the action of the Oilgear unit.

Feeds range from 0 to approximately 40 in. per min. The feed changes are effected through varying the capacity of the pump and its delivery of oil to the piston. Adjustable cams are provided for obtaining the desired feed. The arrangement provides for automatic rapid return of the tooling from the work at the completion of machining operations, as well as for rapid approach of the tooling into position for beginning the cuts. At the completion of the cycle, the tooling is retained in the returned position until the feed is re-engaged by hand. Rapid traverse can be effected automatically during any part of the feeding movement, which reduces the time on pieces having wide spaces between bored or turned lengths.

The tool-carrying units of the platen type machine consist of a front and a rear cross-slide and a main slide, all of which are mounted on a platen. Actuated by the hydraulic mechanism, the platen carries the tooling into position for beginning the machining operations, and away from the work, to the initial starting position, after the tooling units have receded. Although ordinarily rapid, the movements to the platen are fully controllable and, when desirable, can be reduced automatically to any rate of travel that may be required for feeding auxiliary tooling bolted to the platen.

With the indexing turret type Fastermatic the tool-carrying units consist of a front and a rear cross-slide, mounted on a bridge that spans the bed, and an automatically indexed hexagon turret. The cross-slides are adjustable longitudinally.

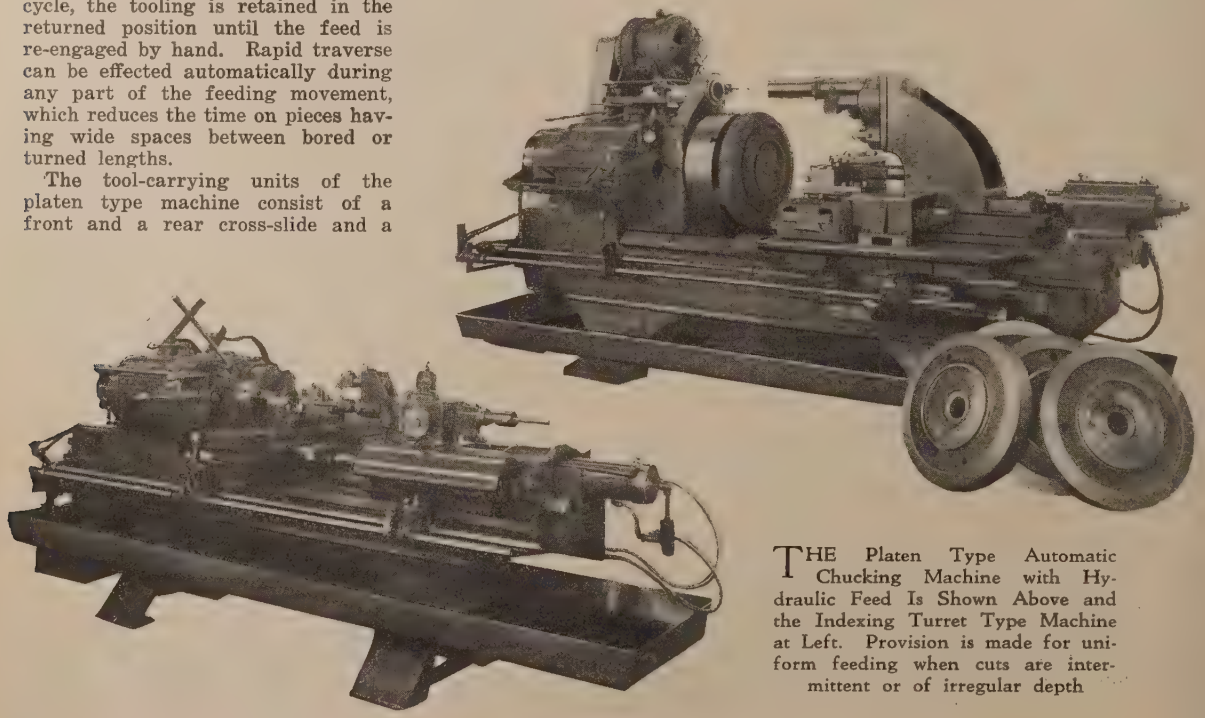
The hexagon turret advances and returns automatically, and the entire action is effected by means of the ram in a hydraulic cylinder located between the ways at the rear. A rapid traverse places the turret in position for starting the boring and turning operations; from this position the turret continues to feed at a predetermined rate. Longitudinal movements of the turret are controlled by cams, one for each face. The cams are carried on a spool and index automatically in correct relation to the faces of the turret. Each cam is adjustable and a separate and independent feed for each face of the turret is readily available. The turret can be adjusted to remain at any fixed return position, or the full travel backward and forward may be accomplished without indexing.

The cross-slides can be operated simultaneously or independently, and can be timed to operate in conjunction with any of the turret faces. The cross action is effected by cams beneath the slides and is controlled by the movement of the turret. At the completion of the cycle the entire tooling is moved clear of the work until the feed is re-engaged by hand. Provision is made for the use of both overhead and centrally piloted tooling, and chucks such as usually used on lathes are readily adaptable to these machines.

Eight spindle speeds are obtainable on the Nos. 1-F and 2-F machines, and 12 speeds on the Nos. 3-F and 4-F. All of the machines are equipped with Timken bearing spindles, ball-bearing back shafts, multiple-disk clutches and steel gearing that runs in oil.

Competitive Exhibit of Plated Finishes

AN exhibit of metals finished in nickel, copper, brass, silver, lead, cadmium, gold and chromium is being sponsored by the American Electroplaters' Society of America for its seventeenth annual convention, Hotel Statler, Detroit, July 8 to 11. This competition will take the place of the usual supply men's exhibit. Three prizes will be awarded to firms submitting best samples of electroplated metal. The usual technical and educational features of these conventions are to be continued.

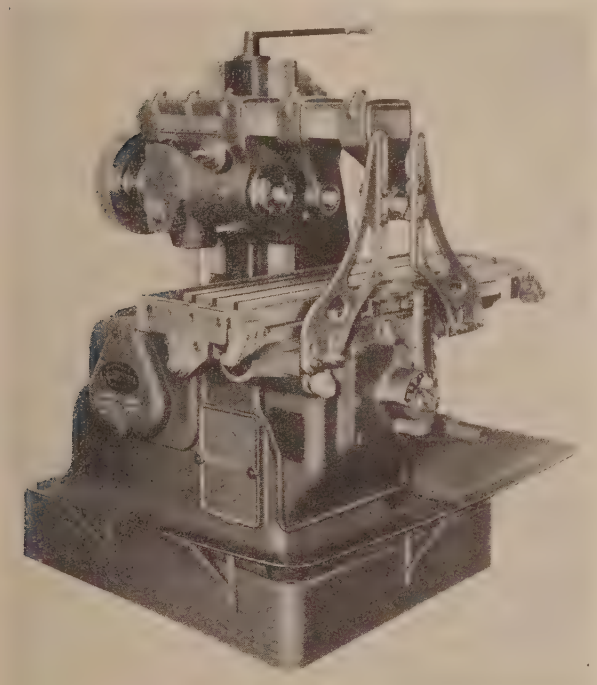


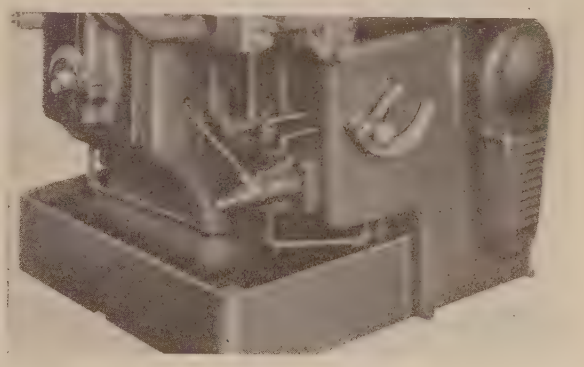
THE Platen Type Automatic Chucking Machine with Hydraulic Feed Is Shown Above and the Indexing Turret Type Machine at Left. Provision is made for uniform feeding when cuts are intermittent or of irregular depth

New Rigidmil Has Hydraulic Feeds

Feed Range Is From 0 to 50 In. and Rapid Traverse 103 In. Per Min.—Mechanical Feed Also Furnished

FOR both general purpose and high-production milling operations, the Sundstrand Machine Tool Co., Rockford, Ill., is bringing out a new Rigidmil that is slightly smaller than its No. 3 machine and is equipped with hydraulic table feed. Mechanical feed can also be furnished, the machine being readily changed from one type of feed to the other at any time.





Manual Feed Control Levers Are Shown in View Above. The lever at left controls the direction of feed and rapid traverse, and that at right the rate of feed

Hydraulic feed is obtained by means of an Oilgear pump in the base of the machine. It provides an extensive variety of feeds within the range of 0 to 50m. per min., rapid approach, automatic relief if the cutter becomes overloaded, dwell at completion of cut; and automatic quick return to starting position. Rapid traverse is at the rate of 103 in. per min. The feed rate best suited to the work can be obtained instantly. When the cutter is overloaded, the hydraulic feed automatically retards and then accelerates to the set rate when normal conditions return. The manual control of feed is through a lever on the front of the saddle, and may be set in five positions: Rapid traverse, to left; feed, to left; neutral; feed, to right; and rapid traverse, to right, the direction of feed or rapid traverse being the same as the lever movement.

Automatic table control is governed by two stop blocks with nine dogs located between them, all adjustable. The blocks will cause the table feed to throw-out within plus or minus 0.002 in. of a selected point. The dogs may be used in various combinations to obtain any desired cycle of feed and rapid traverse.

The mechanical feed unit comprises a gear box for pick-off gears and a longer drive shaft than used with the hydraulic unit. Three pairs of pick-off gears for six feeds, from 1.49 to 22 in. per min., are supplied as standard.

The base-column-saddle casting is made in one piece. The spindle-head is compact and is mounted on the column with narrow guides for alinement. The forged steel spindle carried in Timken bearings front and rear, has the National Standard nose, with hole 2¾ in. in diameter at the large end, and 3½ in. taper per ft. The entire spindle assembly is carried in a hardened and ground steel quill and has 4-in. traverse adjustment.

Smooth spindle drive is obtained through a coarse pitch spiral-bevel pinion and gear, the pinion and shaft being of one piece and mounted in Timken bearings. Pick-off gears, located in the main casting just below the column, provide changes of speed and direction of rotation for the spindle. A fly-wheel on the spindle serves to minimize vibration and chatter from heavy or irregular cuts. The overarm is a solid steel rectangular forging and is adjustable by a rack and pinion.

The main drive clutch of multiple disk type, is compact and sensitive; it runs in a bath of oil and is easily adjusted. The drive is by motor only, a 5-hp., 1200-r.p.m. motor being recommended. The motor is mounted in the base on an adjustable plate and drives the primary shaft through a silent chain. Coolant is contained in a large reservoir in the main casting of the machine. Extra equipment includes a vertical spindle-head and rotary table.

Specifications include: Table working surface, 14½ x 50 in. standard, 14½ x 70 in. special; spindle adjustment, 10¾ in. vertical, 3 in. horizontal; and distance center of spindle to overarm, 6½ in., to table 13⅜ in. maximum and 2⅝ in. minimum. The distance of the spindle face to the outer edge of the table is 14⅜ in. maximum and 11⅜ in. minimum. The distance from the floor to the top of the table is 35 in. The net weight of the machine, which is designated as the No. 30, is 5100 lb.

Side-Discharge Billet Heating Furnace

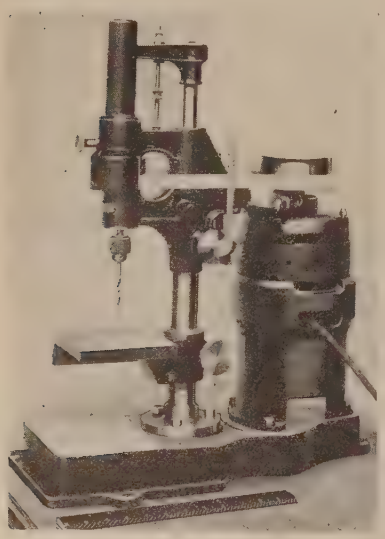
At its new strip mill at Leechburg, Pa., the West Leechburg Steel Co., Pittsburgh, will install a double-fired billet heating furnace. It will be built by the Rust Engineering Co., Pittsburgh, will heat billets and slabs 20 ft. long and will be charged and discharged from the side. Zone control firing will be employed to obtain flexibility in operation with minimum scale losses, despite the varying tonnages of steel heated. The mill will operate at rates ranging from 10 to 25 tons an hour, according to the order being rolled.

Two tiers of burners will be employed, one heating the small soaking chamber at the discharge end which controls the temperature of the discharge steel. The secondary firing ports are to be located behind the soaking chamber and the firing rates are varied in accordance with the tonnage to be heated.

The increasing use of X-rays to determine the internal structure of steel castings, aluminum castings, metal transmission tubes and a variety of other metal objects is described in a booklet entitled "X-rays in Industry," published by the Eastman Kodak Co., Rochester, N. Y.

High-Speed Sensitive Drilling Machine

A NEW high-speed precision sensitive drilling machine that will drill holes up to ¼-in. in diameter to the center of a 6-in. circle is being manufactured by the High Speed Hammer Co., Rochester, N. Y. Spindle speeds of the standard machine, designated as the model R-53, are 2700 and 5500 r.p.m.; with three step pulleys available as extras, speeds of 1500, 3000 and 6000 r.p.m. are obtainable.



The Capacity Is for Holes Up to ¼ In. Standard speeds are 2700 and 5500 r.p.m.

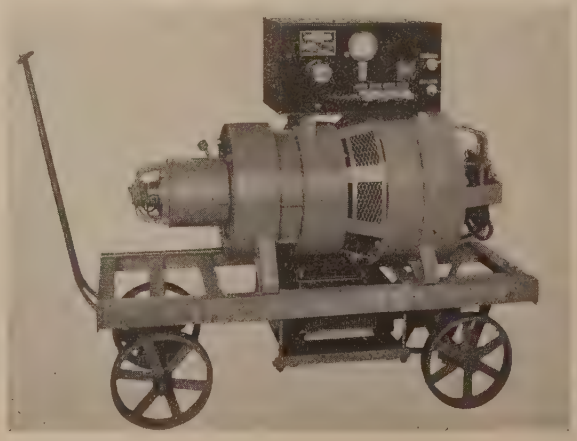
The hardened and ground spindle is guided by a vertical quill supported by ball bearings which take all belt pull. Two ball thrust bearings carry the top of the spindle at the feed arm. The parts ground accurately to size and alinement include the spindle, quill, feed column, main column, table (horizontal surface and apron), and base. Spindle travel may be set accurately by means of a depth gage provided; the maximum travel 2¼ in. The table can also be quickly adjusted in height, or entirely removed if necessary. It has a self-cleaning taper to prevent injury to the ground main column by chips. The base measures 10 x 20 in. overall and has a ground working surface 4 in. x 6 in.

Either direct or alternating current motor can be furnished. Extra equipment includes a foot treadle and rod and a pedestal base. The overall height of the machine illustrated is 24¼ in. and the weight 108 lb. net.

New "Stable-Arc" Welder Has Unified Control

UNIFICATION of the controls of both motor and generator, making for simplified operation, is an outstanding feature of the new "Stable Arc" welder recently placed on the market by the Lincoln Electric Co., Cleveland. The control mechanism is inclosed in a ventilated steel cabinet, while hand regulators and switches are mounted on the panel that forms a side of the cabinet. The control panel contains rheostat regulator, diverter switch, safety starter switch, volt-ammeter and wing-nut cable terminals. In being mounted directly over the motor generator, the control cabinet is not only accessible, but also permits removal of the motor generator armature without disturbing any other parts. In addition, it makes possible use of shorter chassis frame or base than in previous models of the "Stable Arc" welder. The shorter base offers the advantage of less floor space occupied by the welder, as well as smaller turning radius for the portable models.

By means of the volt-ammeter provided the voltage and amperage may be read from the one dial. This volt-ammeter is said to assure longer instrument life because it eliminates use of a separate delicate ammeter that would be given excessive wear on a Lincoln welder due to large output keeping the ammeter jammed against the high limit pin on the dial. Terminals for the lead cables are equipped with winged nuts, which facilitates making connections, especially when it is desired to reverse the polarity of welding current, and eliminates the necessity of a switch for reversing polarity. The company's new safety push-button switch, which eliminates accidental starting, is also a feature of the control mechanism of the new machine. Inclosed wiring of all operating controls, as well as a metal-backed rheostat, are made possible by the unified control cabinet.



Mounting the Control Cabinet Over the Motor-Generator Facilitates Operation, and Permits Removing Generator Armature Without Disturbing Other Parts

Devises Cutting-Torch Tip for Removing Rivets

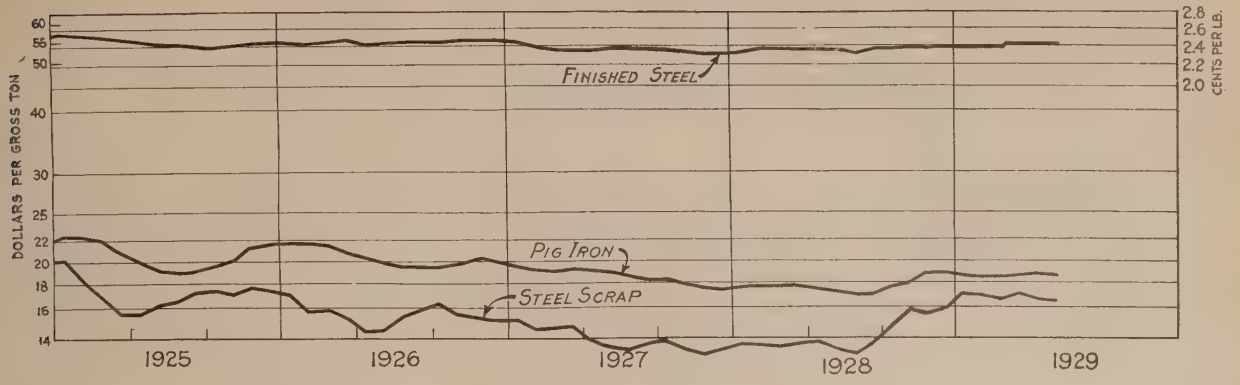
REMOVAL of 7/8-in. rivets at the rate of 7 to 9 per min. is claimed for the rivet piercing tip brought out recently by the Alexander Milburn Co., Baltimore, for use in connection with cutting torches.

The device, which is interchangeable with other forms of tips used on such torches, is centered over the rivet head and the head preheated to the melting point, which results in the forming of a ring as shown. Simultaneously, the body of the rivet is pierced and, due to the expansion and contraction of the plate, the rivet drops out or may be backed out with slight effort. These operations leave the sheet or plate uninjured and are said to meet inspection and tests required by the I. C. C. regulations. Savings in gas and minimum loss of side-sheets due to imperfect cutting, as well as increase in speed, are claimed for this method of rivet removal. The tip is of one piece and of non-flashback design.

The Rivet Piercing Tip Is Interchangeable with Other Tips. The ring formed in cutting the rivet head is shown above

Philadelphia offices of the Diamond Machine Co. and Builders Iron Foundry, affiliated companies, have been removed to 903 Riverson Building. Main plants are at Providence, R. I.

Scrap Prices Have Held Closely to Those for Pig Iron for Nearly a Year. By contrast finished steel has varied scarcely at all in the past several years



Scrap Prices Drop from Peak

Steady Decline from Early April Brings Second Quarter Below First—April Highest Month of First Half

AVERAGE prices of heavy melting steel scrap at Chicago, Philadelphia and Pittsburgh reached a spring peak the first week of April and held it until after the middle of the month. Since then there has been a practically uninterrupted decline until the end of June. The average for April was the highest for any month since the close of 1925.

Maximum prices on the weekly basis were reached at the end of January, but the April average was higher than the January average. It stood at $17.18, and the level has since fallen to $16.39 for June. The last quotation in June was $16.33.

For the second quarter of the year the average price was $16.70. This shows a decline from the $16.90 average for the first quarter. With that exception it was the highest since 1925.

Meanwhile, the average price for pig iron was somewhat higher for the second quarter than for the first—$18.62 against $18.39—also being at the highest level since the second quarter of 1927, when $19.07 was registered.

Finished steel has undergone few price changes since early in 1927. The entire second quarter of this year had the one figure of 2.412c. a lb., and the entire first quarter had 2.391c. a lb. The present price of 2.412c. is the highest since 1927, while the lowest in that period was the 2.318c. average of January, 1928.

Comparative figures for the past 18 months covering steel scrap, pig iron and finished steel are given in the table. The diagram carries the story of these changing prices over a period of four and a half years.

COMPOSITE PRICES

	(Gross Ton) Steel Scrap	Pig Iron	Finished Steel, Lb.
1925 average	*$17.12*	*$20.58*	*2.465c.*
1926 average	*15.48*	*20.42*	*2.439c.*
1927 average	*14.00*	*18.55*	*2.357c.*
January, 1928	13.70	17.63	2.318c.
February	13.71	17.73	2.361c.
March	13.65	17.73	2.362c.
April	13.81	17.67	2.359c.
May	13.90	17.45	2.350c.
June	13.52	17.23	2.341c.
July	13.13	17.10	2.325c.

New Records in Steel Barrel Production and Shipment

WASHINGTON, June 28.—Production and shipments of steel barrels in May, totaling 836,532 and 834,699 units respectively, established records since these data were first compiled by the Department of Commerce, from the beginning of 1925. Output was at the rate of 72 per cent of capacity. The previous records in production and shipments were made in April, according to the Department's figures, and amounted to 771,584 and 775,481 units respectively, operations being at the rate of 64.8 per cent of capacity.

Unfilled orders at the end of May for delivery within 30 days amounted to 316,882 barrels, against 333,614 at the end of April, while unfilled orders for delivery beyond 30 days were 899,090 and 935,430 barrels respectively. Stocks at the end of May were 56,936 barrels, compared with 55,103 barrels at the end of April.

Production during the first five months, representing 58.8 per cent of capacity, totaled 3,476,171 barrels, against 2,995,813 barrels for the corresponding period of last year, at 52.5 per cent of capacity. Shipments were 3,465,700 and 2,989,834 barrels respectively. Production showed a gain of 16 per cent and shipments a similar gain.

Mileage Rates on Slag Are Proposed

WASHINGTON, July 2.—A mileage scale to cover rates on slag from Reading and Swedeland, Pa., is proposed in a report by Examiner Joseph G. Cooper to the Interstate Commerce Commission, made public last week. The scale runs from 100 to 350 miles, with the scale ranging from $1.50 to $2.50 a ton and would be subject to the addition of 70c. a ton for hauls involving carfloat or lighterage services in the New York harbor district. The report was made in connection with a complaint by Cartier & Sons Co., Providence, R. I. The examiner held that rates on slag from all points involved were not unreasonable, but that those from Reading and Swedeland would be unreasonable in the future to the extent they exceeded those proposed in the scale. Other origin points named in the complaint are Hokendaqua and Bethlehem, Pa. Destination points were Providence, Auburn, Esmond and Cranston, R. I.

Chicago Employment Shows Slight Gain

Volume of employment of factories in the seventh Federal Reserve District showed a slight increase for the period April 15 to May 15, but was offset by a decline of 1.4 per cent in the amount of payrolls. The metals and metal products group, says the report of the Federal Reserve Bank of Chicago, reported a slight decline in the number of men employed, the first since July, 1928.

Further expansion in the form of an addition of 35,000 sq. ft. of manufacturing space has been announced by the Surface Combustion Co., Toledo, Ohio. This will give the company a combined floor area for production purposes of 90,000 sq. ft.

Steel Capacities by Districts Published

Interstate Commerce Commission Compiled Data in Its Review and Decision in the Freight Rate Case

IN its decision and review of the rate structure investigation as applying to iron and steel products, the Interstate Commerce Commission published several tables giving ingot capacities by districts and cities, also capacities for manufactured iron and steel articles. These tables are reproduced below.

The accompanying tables give the rated ingot and finished steel and iron capacities by districts and by cities:

Producing Points	Ingot Capacity (Gross Tons)	Capacity for Manufactured Iron and Steel Articles (Net Tons)
EASTERN DISTRICT:		
New England—		
Worcester, Mass.	180,000	172,000
Bridgeport, Conn.	125,000	100,000
Bridgewater, Mass.	.....	35,000
New Haven, Conn.	.....	30,000
New Britain, Conn.	34,000	12,000
Eastern New York—		
Syracuse	63,160	49,300
Troy	.....	60,000
Rensselaer	.....	47,000
New Jersey—		
Trenton-Kinkora	150,000	90,000
Harrison	83,350	34,400
Perth Amboy	50,000	35,000
Maryland—		
Sparrows Point	1,020,000	480,000
Baltimore	.....	60,000
Cumberland	.....	30,000
Delaware—		
Claymont	360,000	225,000
New Castle	160,000	.....
Eastern Pennsylvania—		
Bethlehem	1,512,000	1,085,000
Coatesville	1,226,480	818,200
Steelton	776,000	130,000
Ivy Rock	529,000	125,000
Harrisburg	325,000	266,000
Philadelphia	294,540	135,000
Pencoyd	240,000	222,000
Phoenixville	225,000	150,000
Pottsville	200,000	180,000
Reading	46,128	225,000
Lebanon	.....	221,500
Burnham	165,000	45,000
MIDDLE DISTRICT:		
New York-Buffalo District—		
Lackawanna	1,824,000	690,000
Buffalo	690,000	470,000

Michigan	57,200	332,000
Kentucky	820,000	280,480
Illinois	5,168,835	3,347,700
Wisconsin	24,500	363,800
Totals, western district	13,025,535	9,847,340
Grand totals	54,807,343	40,977,175

Capacities of 16 Other Companies

Other producing companies having an ingot capacity of 500,000 gross tons or over are shown below. These 16 companies, together with the two mentioned above, control approximately 85 per cent of the ingot capacity of the entire territory.

Name of Company	Ingot Capacity (Gross Tons)
Youngstown Sheet & Tube Co.	
Youngstown	2,400,000
Indiana Harbor, Ind.	840,000
Jones & Laughlin Steel Corp.	
Pittsburgh	1,860,000
Woodlawn, Pa.	1,140,000
Inland Steel Co.	
Indiana Harbor, Ind.	1,600,000
Republic Iron & Steel Co.	
Youngstown	1,800,000
Wheeling Steel Corporation	
Steubenville, Ohio	600,000
Portsmouth, Ohio	448,000
Benwood, W. Va.	225,000
United Alloy Steel Corporation	
Canton, Ohio	1,000,000
McKinney Steel Co.	
Cleveland	1,000,000
American Rolling Mill Co.	
Middletown, Ohio	507,000
Ashland, Ky.	330,000
International Harvester Co.	
Chicago	700,000
Lukens Steel Co.	
Coatesville, Pa.	686,480
Pittsburgh Steel Co.	
Monessen, Pa.	600,000
Pittsburgh Crucible Steel Co.

Total	17,975,480

The Interstate Commerce Commission points out that the most important markets for steel are in the States where most of the steel is manufactured, Michigan being the sole exception, as follows:

State	Percentage
Pennsylvania	21.7
Illinois	14.32
Ohio	9.70
Michigan	8.08
Indiana	6.93
New York	5.31
New England States	3.75
New Jersey	3.23
Delaware, Maryland and District of Columbia	1.59
Virginia	1.02
Total of above	75.63

This Issue in Brief

Increased strength at ordinary and high temperatures is imparted to gray iron by adding chromium up to 0.90 per cent. Improved heat resistance qualities are probably due to presence of chromium carbide in the cementite of the pearlite.—Page 16.

* * *

Freight rate increases for short hauls will encourage motor truck transportation. Chicago steel producers expect savings as high as 50 per cent to result from motor truck deliveries, giving consumers prompter service and saving them cost of hauling from railroad.—Page 22.

* * *

Iron and steel tariff bill is evidently not satisfactory to Senate subcommittee. If majority views prevail, the schedule will be greatly changed.—Page 24.

* * *

"Orgy of excessive claims for superiority of (steel) products differing but slightly, if at all, from those of other manufacturers, has assumed fantastic proportions," says James A. Farrell. The industry as a whole suffers thereby, he says, urging trade associations to frown upon illogical and unwise claims in selling policies.—Page 30.

* * *

Decline in bank clearings may indicate the beginning of a slackening in trade, says Dr. Haney. Building activity is declining, and automobile business appears to be rounding off, he says.—Page 18.

* * *

Machinery exports decline for second successive month. May shipments out of the country were valued at 48 million dollars, against 51.4 millions in April. Total for the first five months is, however, 37 per cent above same period of 1928.—Page 70.

Airplane builder uses mild-carbon steel tubing for fuselage and tail surfaces, as it is readily welded and gives a better strength-weight ratio than low-carbon steel, at the same time being less expensive than chrome-molybdenum steel. The alloy steel is, however, used for axles, which are subjected to high bending stresses.—Page 4.

* * *

Conflict on manganese ore tariff reflects desires of senators' constituents. High-tariff and low-tariff senators in manganese ore-producing States ally against senators in steel-producing areas. Steel manufacturers favor reduction or elimination of manganese ore tariff.—Page 24.

* * *

Sharper competition for steel business in areas lying between producing centers will result from new freight rates. New schedule is largely in favor of Pittsburgh producers in the competitive territories.—Page 21.

* * *

Steel exports increase while imports decline. Exports for first five months of 1929 were 23 per cent above same period of 1928, while imports declined 11 per cent.—Page 65.

* * *

Price average of finished steel products unusually stable. It showed no change at all during second quarter. Scrap price average, however, declined in June to the lowest average monthly price this year, after reaching a three-year peak in April.—Page 35.

* * *

Machining gray iron castings results in loss of hardness. But under certain cooling conditions, high-test iron holds its Brinell hardness throughout the section.—Page 6.

Finds cast iron slightly superior to steel or wrought iron in atmospheric corrosion resistance, in majority of cases studied. Investigator points out that in soil corrosion the governing factor is the nature of the soil.—Page 8.

* * *

"Fight together for more of the consumer's dollars instead of fighting each other for his dimes," is advice given to steel producers and consumers. Makers of finished steel products are urged to develop promising markets by stressing steel as a sales point.—Page 29.

* * *

Fatigue strength of cast iron is markedly increased by oft-repeated stresses below the endurance limit. Up to 800 deg. Fahr. there is no great reduction in fatigue and tension strengths and in Brinell hardness.—Page 7.

* * *

Pig iron daily output for June averaged 2 per cent under May, having been 123,255 tons a day. On July 1 there were 218 furnaces in blast, a net loss of one for the month. New half year record was established with output of 21,621,363 tons, 3.75 per cent above previous record, made in first six months of 1923.—Page 42.

* * *

Cutting tools made of high-speed steel containing tin and arsenic will not stand up well. A. S. T. M. research committee reports. Special heats were made of steel containing 0.40 per cent arsenic and 0.40 per cent tin. Service tests of cutters, reamers and twist drills made from this steel revealed the steel to be unsuitable for the purpose.—Page 12.

ESTABLISHED 1855

Swings in Finished Steel Demand

EITHER there will be a wider gap than ever between the steel making and the steel finishing capacity of the country, within a year or so, or the amount of new construction of steel making units will be quite out of line with the well considered advice given at the spring meeting of the American Iron and Steel Institute. In finishing departments no little new construction is going forward, with other work intended as soon as plans can be matured. Yet there is little new construction as to steel making.

Some definite reasons can be given for greater increase in steel finishing capacity at this time than in producing capacity. There have been remarkable swings in the relative demand for different finished steel products. Now that a half year has been completed a general review is in order. Commenting on the 1928 production statistics THE IRON AGE of May 9 noted that, while there was a large gain in total finished steel production from 1926 to 1928, there had rarely been such a period of sweeping changes in the character of steel demand. Rails, plates, skelp and miscellaneous showed substantial decreases, so that other lines had to show all the greater increases, and these increases were supplied very largely by sheets, strips and bars.

Now with another half year passed one can observe that some of these swings have continued, instead of there being a tendency back toward the 1926 distribution. While this year's total steel production promises to make a new record by a substantial margin, rails are likely to show a further decrease. Production of sheets and strips, on the other hand, has continued increasing at the remarkable pace shown in 1928.

Plate demand has reacted. It fell off from 1926 to 1928, with a decrease of 287,554 tons, while this year plates are going very strong. History indicates that we should expect wide fluctuations in plate demand, rather than a continued swing, such as there is in strips.

Within the general class of tubular goods, to complicate matters further, there are swings in processes of manufacture more than in total demand; first, the gains in seamless over fire welded, and now also the new vogue of electric welding, which started only a couple of years ago in large diameter pipe and is extending to smaller diameters.

The increasing specialization of rolling mills or finishing departments naturally adds its own contribution to the gap between steel making and steel finishing capacity. Each "finishing department" of the steel industry is generally divided into several finishing departments, making different sizes. And with it all, consumers have become punctilious as to precisely how much steel they want and exactly when they want it.

Railroad Outlay for Steel

CAPITAL expenditures of Class I railroads are summarized and discussed in a pamphlet (Miscellaneous Series No. 48) just issued by the Bureau of Railway Economics, Washington. Expenditures for current operation are also considered. In 1923 capital expenditures were slightly over a billion dollars, and year by year, except for a bulge in 1926, they decreased until they ran just over two-thirds of a billion in 1928. The figures are by no means a direct measure of the amount of steel absorbed. To make steel tonnage the best way for railroads to spend money is in freight cars and locomotives. Rails are another way, but the rail purchases are chiefly for replacement. There is some capital expenditure in them, however, for increased weight is carefully charged to capital. Thus, in 1928 the rail expenditures charged to maintenance amounted to $92,181,000, while in addition there was charged to capital $47,192,000 for "heavier rail," this being 69 per cent more than the amount so charged five years earlier.

From 1923 to 1928 there was a decrease of $382,484,000 in total capital expenditures, but for locomotives and freight cars the decrease was $450,581,000; i.e., capital expenditures for all other purposes actually increased by $68,097,000, which is 15 per cent of such expenditures in 1923.

In six years there has been a large turnover in locomotives and freight cars, installations slightly exceeding retirements in the case of freight cars but falling far short in the case of locomotives. The pamphlet mentioned gives tables of equipment installed and retired by years, 1923 to 1928 inclusive. During this period both locomotives and freight cars rapidly decreased, 1928 compared with 1923 showing only 31 per cent as many locomotives and 24 per cent as many freight cars installed. Locomotive retirements were relatively constant, while freight car retirements greatly decreased. The sum totals for the six years show 13,560 locomotives installed and 18,562 retired; 749,116 freight cars installed and 747,915 retired.

By referring to statistics of equipment in service Dec. 31, 1922, the turnover in the following six years may be computed. Relative to number in service at that date, the locomotive installations were 21 per cent and the retirements 29 per cent, while the freight car installations and retirements both figure out ap-

proximately 32 per cent. Thereby the railroads must have worked their equipment into pretty good shape.

The relative consumption of steel by the railroad and automotive industries is interesting. It is a curious coincidence that, according to the annual findings of THE IRON AGE, the combined percentages were precisely the same for four years, 1923 to 1926 inclusive, whereupon there was a drop. The percentages of total steel were as follows:

	Railroad	Automotive	Total
1923.....	27	11	38
1924.....	28	10	38
1925.....	25	13	38
1926.....	23½	14½	38
1927.....	19	14	33
1928.....	16	18	34

At the middle of a year a forecast of railroad absorption of steel for the entire year would be largely conjectural. Substantially this would be true of the automotive industry, particularly as we do not know what the year's total steel production will be. It is possible to apply factors of usual seasonal variation, however, for both automobiles and steel and such a computation brings out 22 per cent as the 1929 automotive proportion. It would require 16 per cent by the railroads to restore the former 38 per cent for the two, and that seems hardly probable.

Copper Curtailment

A SOMEWHAT contradictory situation has developed in the copper market. Visible stocks, on which good statistics are available, are very low and increased but slightly in May. Large foreign buying is said to be necessary to cover July and August requirements. Some American consumers have been asking for prompt delivery of copper ordered for July. The refinery price has been stationary at 17¾c. for about three months. Yet with supplies small, demand large, and a market price yielding excellent returns, one of the leading producers has curtailed mine output 25 per cent.

Several reasons for such a move could be given. Officials of that mining company may believe that the large demand from copper and brass fabricators during the last six months represents a peak in the latter's business, and that normal consumption can be adequately supplied by a less-than-capacity operation at the mines. Such a view may be correct, since the producer that has curtailed is highly integrated, and the mine production could well be governed by the condition of the order books of the brass-making subsidiary.

On the other hand, it might be argued that curtailment is primarily in the interest of stabilization. Actual sales of copper have been in small volume for some weeks; the price has been regulated by the necessity of custom smelters to sell a relatively small tonnage. What is to be the price of copper when consumers come seriously into the market, when they have used up all the high-priced metal they scrambled to buy during the first quarter? While the law of supply and demand has been often amended or nullified, it remains true that if a necessity is scarce it commands a high price. On the other hand, if plenty of copper is available, consumers are likely to get it cheaper.

As a matter of fact an ordinary producer of copper could make nearly the same profit at 75 per cent operation, if thereby the price could be maintained at the present level, as at full capacity operation with the price a cent lower.

To Lift Europe by Lifting Wages

BY raising the standard of wages in European countries, Henry Ford believes that some measure of the prosperity which the United States is enjoying can be brought to the manufacturing nations abroad. Mr. Ford has persuaded the Twentieth Century Fund to donate $25,000 to the International Labor Office of the League of Nations to secure data on employment conditions in Europe, upon which the Ford Motor Co. can equalize real wages in its plants in all countries.

That "America's prosperity is largely due to the unprecedented increase in the purchasing power of the people," is the statement of the president of the fund, Edward A. Filene of Boston, in making the announcement of the $25,000 donation. He goes on to say that "the same policies that produce prosperity in the United States will produce prosperity in France or Germany or England or any other nation."

Although not a few American manufacturers were skeptical of the wisdom of the high minimum daily wage when it was first established in the Ford plants in this country, the opinion is now widely held that well-paid labor has contributed a large part to our present prosperity. Mr. Schwab, in his presidential address to the American Iron and Steel Institute at its May meeting, said: "All of us have come to recognize the great economic importance of maintaining a high wage scale."

Just as the prosperity of every man's neighbors in our own country helps both his and the general prosperity, the Twentieth Century Fund believes that increased prosperity in European countries will help us in the sense that "prosperous neighbors fill each other's pocketbooks" and that "any increase in the purchasing power of the masses of the people in any nation will be of inestimable benefit, not only to that nation, but also to the world at large."

Right Handling of Technical Sessions

WHO that has served any considerable term in attending engineering society meetings has not learned that what the chairman does or fails to do goes far toward making a session a success or a failure? The program may be outfitted with prominent names; the session subject may be of high timeliness, and moot enough to sharpen interest and loosen tongues; but unless there be animated and well-directed leadership from the chair, the outcome, in free and worth-while discussion, will be lamentably small.

The custom of bestowing session chairmanships on past officers or on men who have earned prominence by laboratory work or contributions to literature is entirely understandable. But it may be suggested that doing honor to one who has worthily achieved in his special field should not be the first consideration in making such selections. "Professor Brown," leading

research chemist, may very naturally be thought of to preside over a session on nitriding, but if he lacks that "gift of people" which would draw out expression from the right men at the right juncture this long-time custom might better be honored in the breach than in the observance.

The late Dr. Charles B. Dudley, who for seven years presided over the meetings of the American Society for Testing Materials, was a master of the art of drawing out discussion. None who attended the Atlantic City meetings of 20 to 25 years ago can forget that the charm of his personality, his rich experience and his way of stimulating free expression by those best fitted to speak on the subject in hand made many a session memorable. Makers of programs, in all our engineering societies, may well take a leaf from the Dudley memoir and bring technical discussions to the old-time place of service and distinction.

Studying the Lesser Savings

MANUFACTURING economies do not always fall in the category of higher speed of operation, fewer men for a given task, greater use of mechanical conveyors, less cross-hauling of parts, and maximum use of automatic machinery. Frequently a change that appears insignificant cuts the cost of an important piece and, through much repetition in the production of that part, converts itself into a sizable sum on the right side. It may take the form of an engineering innovation or its bearing may be chiefly commercial. A single case will illustrate the point:

Automobile crankshafts have been forged from round steel bars cut to length and from square billets of equivalent cross-section. It was thought in the engineering department of one plant that the round bars were necessary for best results. But tests showed this was not the case. Hence the practice changed to the use of square billets, for two reasons: They were a bit cheaper to buy; they were considerably less costly in freight charges, as they took the rate for semi-finished steel. An added advantage was that they overcame the tendency occasionally noticed with the rounds, of piling up in their progress down the gentle slope of the heating furnace hearth.

Here the commercial factor, reduced cost of delivered raw stock, and the practical or engineering consideration of less trouble in heating combined to suggest a change in shape. Not always is the advisability of a departure so clearly indicated. More frequently, perhaps, it is a case of striking a balance between prospective advantages from one source and disadvantages likely to result from some other condition involved in the proposed practice.

CORRESPONDENCE

Resistance of Steel Pipe to Soil Corrosion

To the Editor:—The article entitled "Pipe Steel Resists Corrosion Poorly" (page 1569, THE IRON AGE, June 6), gives me the impression of overemphasizing the tendency of steel pipe to corrode compared with other kinds of ferrous metals, in spite of the brief abstract from a paper by the writer which is placed at the end of your article. A prominent steel casting manufacturer wrote me in regard to this abstract, thinking that it was striking at his product, which is made to resist wear. Apparently he did not get the idea that the remarks credited to the writer were made solely with reference to the corrosion of ferrous metals. A brief abstract without an explanatory note is likely to be misunderstood.

One inference from the article is that steel should not be used by itself to resist corrosion. As a matter of fact, 90 per cent of the steel oil and gas mains are laid without any protection. The Bureau of Standards soil tests to which you refer indicate that cast iron is penetrated at least as deeply as steel where the soil is corrosive. Cast iron, however, is not mentioned in your article.

Another interesting fact not brought out by these tests is that the rate of corrosion varies about 30 to 1 in different soils, whereas the difference between the average rate of corrosion of different classes of ferrous metals is only about 12 per cent, which does not include cast iron.

I would also take exception to the remark that "Pitting under a good protective coating has been noted on pipe which had not properly been de-scaled and dried." This may have been true in certain specific cases, but it is still a question among engineers as to whether it pays to de-scale pipe before coating. The moisture in these cases probably came from the soil after the pipe was laid. Experiences show that all such action can be prevented by closer attention to the character of the coating.

The data given to support the theory that 0.22 per cent carbon steel is less susceptible to corrosion than 0.08 per cent carbon steel include tests of a few weeks' duration in solutions approximating some ground waters. Much more extensive data exist to disprove the effect of carbon under these conditions. In any case such tests do not include contact with the soil and are therefore not relevant to the case. This and the de-scaling discussion are obviously exploiting the contentions of the company mentioned in connection with this article. The discussion of this article at the Bureau of Standards meeting tended to clear up some of the points referred to above. About 35 papers on the subject of soil corrosion were presented at this conference, which was of a rather private nature.

F. N. SPELLER,
Director Department of Metallurgy and Research, National Tube Co.

Pittsburgh, June 22.

Against Use of Word Only in Advertising

To the Editor: "Not All the People All the Time" sure enough is right. The editorial (June 27, page 1788) should be broadly distributed to every paper in the land, or better pasted up in about 50,000 sales offices in various industries in the country.

Public distrust is one thing, disgust is quite another, and that is present also.

You miss one very highly important point, and that is the use or abuse of the expression only. This is an out and out abuse, and just what the moral and the legal situation is I have never seen expressed.

I refer to such expressions: Electric ice box, only $240; vacuum cleaner, only $75; radio, only $175, or only $25 down and only $10 a month; auto, only your old car down, and $40 a month.

The situation in this good old U. S. A. is not vastly different from what it was some years ago. The average income of the average individual is not better than $1,200 per year, or $100 per month, and that is just ahead of starvation, and I should think that seeing on all sides that word only would drive thousands mad.

SIDNEY CORNELL,
Professional engineer.

New York.

CARNEGIE LIBRARY OF ATLANTA

Steel Founders Plan Broader Association

Following Summer Studies Will Formulate Definite Objectives in Fall Meeting

WITH plans for an expansion in association activity, executives of steel foundries met at White Sulphur Springs, W. Va., June 27 and 28. What is in mind is a much larger organization than now represented in the Steel Founders' Society of America and possibly such additional services to the industry as studies in trade development. Granville P. Rogers has been engaged as managing director of the society, with headquarters at 932 Graybar Building, New York, and in the next two or three months Mr. Rogers is to make an intensive investigation of the steel foundry's commercial and economic problems. A meeting of the society is then likely to be held in September with the presentation of definite objectives. Meanwhile an effort will be made to increase the membership two or three times the 48 foundries now enrolled and regularly reporting on the state of bookings, operations and shipments.

The sessions at White Sulphur were largely informal, the one stated address being made by Homer J. Buckley, president, Buckley, Dement & Co., Chicago, advertising specialists, who devoted himself to what he emphasized as creative salesmanship. He touched on the place of the association in meeting the big problem of the economics of distribution, pointing out that three objectives of an association, the getting of new members, expanding production and securing better prices, are virtually all solved if widened use of products is achieved.

A. H. Jamieson, Malleable Iron Fittings Co., Brantford, Conn., reported on the action of the American Society for Testing Materials in respect to a standard for valves, fittings, flanges and the like for high temperature service. That society would take no account of steel made by the converter process but allows alone for the open-hearth and electric furnace processes, as a result of the force of the contentions of the buyers of such products that the steel must meet highly specialized service. The consensus of opinion was that the steel castings society needs to take an active part in the negotiations over standards to see that nothing intentionally unfair is allowed to be written in the testing society's specifications but to be awake to the fact that such specifications are commonly influenced by engineers of consumers without the full checks of the knowledge of the producers. That the situation is a practical one was brought out in the announcement of plans of the testing society to draw up a standard for alloy steel castings.

Reports from 48 members having a monthly capacity of 38,000 tons showed that May operations averaged 92 per cent.

Shipments in May were at a rate of 93½ per cent of capacity. Bookings for June, according to preliminary estimates, appeared to be at about an 86½ per cent rate.

The officers of the society are: President, J. E. McCauley, Birdsboro Steel Foundry & Machine Co., Birdsboro, Pa.; vice-presidents, W. H. Worrilow, Lebanon Steel Foundry, Lebanon, Pa., and A. Simonson, Falk Corporation, Milwaukee; treasurer, G H. Friesel, United Engineering & Foundry Co., Pittsburgh.

Members of executive committee, J. P. Allen, Union Steel Casting Co., Pittsburgh; H. E. Field, Wheeling Mold & Foundry Co., Wheeling, W. Va.; J. E. Galvin, Ohio Steel Foundry Co., Lima, Ohio; H. J. Koch, Fort Pitt Steel Casting Co., McKeesport, Pa.; J. T. Osler, Hubbard Steel Foundry Co., East Chicago, Ind.; S. W. Utley, Detroit Steel Casting Co., Detroit; and H. F. Wahr, Mesta Machine Co., Pittsburgh.

June Automobile Production Heavy

Chevrolet Sets New Record for One Month's Production—Seasonal Decline Is Unusually Slow

DETROIT, July 2.—Despite the fact that the peak of activity in the automobile industry has passed, several production records were established by manufacturers during the past month. The seasonal decline in output this year has been unusually slow, and only one company, which has made public its figures for June, showed a decrease in shipments compared with the same month of 1928.

The Chevrolet Motor Co. set a new record for one month's production by turning out 151,297 units. This is nearly 20,000 more than the 132,800 units built in June, 1928. For the first half of 1928 the company manufactured 845,469 six-cylinder cars, the largest production ever reported by a company making six-cylinder models. This is a substantial gain in number of units compared with the 751,542 four-cylinder cars produced by Chevrolet in the first six months of last year. W. S. Knudsen, president, predicts that total output for 1929 will reach 1,250,000 units.

The Oldsmobile division of General Motors shipped 67,389 units in the first half of 1929, compared with 50,070 in the same period of 1928. Shipments of Vikings are not included in these figures.

The Buick Motor Co. division of General Motors produced 14,665 cars in June, of which 10,400 were Buicks and 4265 Marquettes. In the previous month total production was about 12,000 cars. The July schedule calls for 31,408 cars, consisting of 23,408 Buicks and 8000 Marquettes.

Shipments of the Hudson Motor Car Co. in the first half of the year amounted to 226,318 units, including Hudson and Essex cars. This is the highest production for a six months' period in the company's history. June shipments were 31,137 cars.

The Reo Motor Car Co. shipped 3042 cars and trucks during June, compared with 6132 units in June, 1928, and 4453 units in May, 1929. For the first six months of 1929 shipments aggregated 23,127 units, compared with 26,031 units in the same months last year.

Shipments of 1405 cars were made in June by the H. H. Franklin Mfg. Co. This is a gain of 74 per cent over June, 1928. For the first six months shipments totaled 8719, a new record and an increase of 135 per cent over the similar period of 1928.

The Auburn Automobile Co. reports June shipments of 3144 cars, a new monthly record and a gain of 124 per cent over June, 1928.

The Packard Motor Car Co. produced 46,702 cars in the 10 months ended June 30, compared with 41,131 cars in the corresponding period of the previous fiscal year.

Durant cars shipped to Canada during the first five months of 1929 showed an almost 100 per cent increase over the same period of 1928. In that period Durant Motors of Canada, Ltd., earned $1.19 a share, compared with $1.02 a share in the same period last year.

Cooperative School Students Graduated

Bristol, Conn., has just graduated the first students in its cooperative industrial school, founded in 1925. During the first year of their schooling the boys spent part, and during the last three years and during vacation periods, much of their time in manufacturing plants securing practical experience. They completed 6750 shop hours, received 20 to 30c. an hour and earned during the course approximately $1,660 each.

Connecticut companies giving financial and practical support to the school are the Wallace Barnes Co., American Silver Co., E. Ingraham Co., New Departure Mfg. Co., and Veeder-Root, Inc.

Carboloy Co., Inc., 350 Madison Avenue, New York, has opened a New England sales office at Bridgeport, Conn., with H. R. Hayter, 515 City National Bank Building, in charge.

New June Record in Iron Output

Daily Rate Less Than May by 2490 Tons or 2 Per Cent—New Six Months' Record—Net Loss of One Furnace

NEW records for June were made in pig iron last month. The production was not only the largest for that month ever recorded but a new high in totals for six months was registered. The May record still stands at the top.

Telegraphic reports on July 2, with only one furnace estimated, show that the June pig iron output was 3,697,628 gross tons, or 123,255 tons per day for the 30 days. This is a loss of 2490 tons or about 2 per cent from the 125,745 tons per day for the 31 days in May. The best previous June record was 3,676,445 tons or 122,548 tons per day in 1923.

A New Six Months' Record

For the six months to July 1, the production was 21,621,363 tons. The best previous half year was 20,841,534 tons to July 1, 1923, so that this year's output is 3.75 per cent in excess of the 1923 total. In 1918, the third largest six months, the total was 20,503,477 tons to July 1. No other six months ever reached 20,000,000 tons nor did any six months' period ever attain these heights.

Operating Rate on July 1

On July 1 there were 218 furnaces active, having an estimated daily operating rate of 121,945 tons. This contrasts with 126,150 tons per day for the 219 furnaces active on June 1. There has been a decided slacking in operating rate for the larger furnaces during the month which accounts largely for the considerably lower operating rate with only one

Daily Average Production of Coke Pig Iron in the United States by Months Since Jan. 1, 1925—Gross Tons

	1925	1926	1927	1928	1929

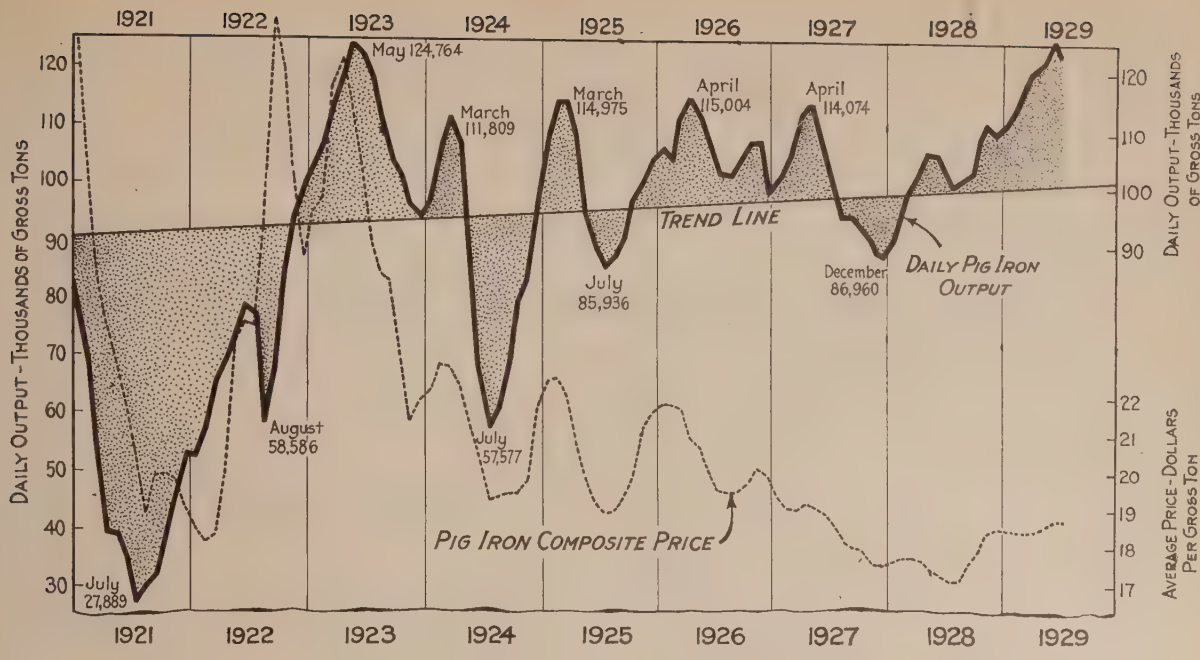
*These totals do not include charcoal pig iron. The 1928 production of this iron was 142,960 gross tons.



Production of Pig Iron in June Represented an Average Output per Furnace Close to 565 Tons

Inclined line represents the gradually increasing theoretical needs of the country, ascertained by a balancing of the ups and downs in production. It shows an average yearly increase in consumption of about 423,000 tons

less furnace. Three furnaces were blown in and four were blown out during June.

The Steel Corporation blew in one and shut down two furnaces as did also the independent steel companies. One merchant furnace was blown in, the net loss being one steel making stack.

Steel-Making Iron Output Still Large

Production of steel-making iron in June was 99,813 tons per day, the second largest on record. In May the 100,174 tons per day was the record. Merchant iron output fell off sharply in June or 23,442 tons compared with 25,571 tons per day in May.

Very Large Ferromanganese Output

Ferromanganese output at 33,363 tons in June is the largest in over 30 months. In July 1928, the 32,909 tons was the best previous recent record. Seven furnaces are now making this alloy. Only two are producing spiegeleisen.

Furnaces Blown In and Out

Among the furnaces blown in during June were one furnace at the Steelton plant of the Bethlehem Steel Corporation in the Susquehanna Valley, one Duquesne furnace of the Carnegie Steel Co. and the Neville Island furnace of the Davison Coke & Iron Co. in the Pittsburgh district. The four furnaces shut down were one Duquesne furnace of the Carnegie Steel Co. in the Pittsburgh district, one Ohio furnace of the Carnegie Steel Co. in the Mahoning Valley, the Martin's Ferry furnace of the Wheeling Steel Corporation in the Wheeling district and one Iroquois furnace of the Youngstown Sheet & Tube Co. in the Chicago district.

Possibly Active Stacks Reduced

The Thomas furnace of the Milwaukee Blast Furnace Co., Chicago, has been scrapped. Thus the number of possibly active stacks in the United States has been reduced from 319 to 318.

Unloading Capacity of 3600 Tons an Hour

Three 17-ton electric unloaders recently purchased from Wellman-Seaver-Morgan Co., Cleveland, for the new docks of the Hocking Valley Railroad Co., at Toledo, Ohio, will have hourly capacity for handling 1200 tons each. The trolley with its bucket will be designed for one trip in 50 sec. with a 17-ton load. The travel speed will be from 75 to 100 ft. a minute. The unloaders will operate on tracks spaced 72 ft. 6 in. apart, each track consisting of a pair of rails on 24-in. centers with the forward track center 5 ft. 6 in. from the face of the dock.

These unloaders are designed to excavate from the ore-carrying boats and to load into railroad cars standing on any of the four tracks inside of the span or to stock under a cantilever beyond the rear leg, through disk hoppers and traveling scale larry cars.

Iron and Steel Markets

Pig Iron Production Still High

June Daily Rate Second Only to May Average—July Steel Output to Be Heavy—100,000 Tons for Pipe Line Placed

THE rate of pig iron production in June, at 123,255 tons a day, was the second highest for any month on record, being exceeded only by the daily average of 125,745 tons for May. The decline from the previous month was less than 2 per cent, according to blast furnace returns to THE IRON AGE.

Most of the loss was in merchant pig iron, the recession in the output of steel-making iron having been only 361 tons a day. This showing is not surprising in view of the reduced operations of such large users of merchant iron as the cast iron pipe plants, the makers of radiators and heating equipment and producers of sanitary ware, in contrast with the well-sustained activity of the steel mills.

Throughout June steel ingot output was at close to capacity and variations in operations were due chiefly to the physical limitations of equipment, making weekly percentage estimates of production futile. While accurate statistics for June will not be available until the American Iron and Steel Institute publishes its monthly report, it can safely be said that ingot output in the first half of 1929 approximated 29,000,000 tons, establishing a new six months' record by a margin of nearly 16 per cent over the last half of 1928.

Steel output in the first week of July will be adversely affected by the holiday, with some mills scheduled to shut down from Wednesday night until the end of the week. Advantage will be taken of this interruption to make greatly needed repairs. The outlook for the rest of July is excellent; in fact, a leading steel producer looks for no appreciable change in the operating rate for the next two months. Fluctuations in the output of different kinds of finished products have thus far tended to neutralize one another, leaving the demand for crude steel substantially unchanged.

Mills catering to the automobile industry continue to reduce their backlogs, but unfilled orders for the industry as a whole have held up exceptionally well. Although the Steel Corporation is expected to report a reduction in its unfilled tonnage as of June 30, the decline will probably be small.

The mid-summer falling off in the steel requirements of the motor car builders has been rendered less severe than usual by the sustained operations of makers of low-priced automobiles. The July schedule of the Ford company calls for the manufacture of 190,000 cars.

Rail mills, as a result of supplementary orders, will maintain present operations through July and August instead of undergoing the customary seasonal curtailment. The Norfolk & Western has distributed orders, subject only to formal confirmation, for 39,000 tons of rails. The Pennsylvania has exercised options on 20,000 tons.

Pipe lines are again conspicuous for their contribution to mill commitments. The National Tube Co. and the A. O. Smith Corporation share equally in 100,000 tons of steel for a 22-in. gas line connecting Birmingham with Atlanta. A projected line from Texas to Omaha has been revived, with the probability that it will be placed soon. A 1000-mile gas line is in prospect and the laying of lines to the populous centers along the Eastern seaboard is now receiving serious consideration.

Structural steel awards, at 42,000 tons, were in fair volume, and the large total of pending work was augmented by 37,000 tons.

The buoyancy of steel demand in the face of seasonal influences is particularly notable at Chicago, where specifications again equal shipments and sales for the week were the fifth largest this year.

Prices of semi-finished steel are not yet well defined. The extension of contracts at second quarter prices and the fact that little third quarter business has yet been closed raise doubt in the minds of buyers as to whether advances can be maintained, although some mills are taking a firm stand at $35 for billets and slabs.

Pig iron shipments are being suspended in some instances by automotive foundries, but June deliveries of merchant iron in the Central West declined only about 10 per cent from those of May and shipping orders have shown no further reduction in the first week of July. Western furnaces have a substantial backlog of third quarter business, as a result of steady buying over a number of weeks rather than a concentration of contracting. In other districts melters are still slow in acting on their requirements for the quarter, both on account of a carryover of tonnage and uncertainty as to price.

Total pig iron production for June, at 3,697,628 tons, showed a decline from May's 3,898.082 tons, but was the largest for any 30-day month. Output for the first half of the year, at 21,621,363 tons, established a new six months' peak, exceeding the previous record, made in the first half of 1923, by 3.75 per cent. Furnaces in blast July 1 numbered 218, a net loss of one compared with June 1.

Both of THE IRON AGE composite prices are unchanged. Pig iron is $18.63 a gross ton for the fourth week and finished steel stands at 2.412c. a lb., from which it has not deviated since April 1.

Pittsburgh

Completing a Record Half Year, the Steel Industry Faces a Summer of Unusual Activity

PITTSBURGH, July 2.—With many records achieved, the steel industry has completed what has apparently been the most prosperous six months in its history and now faces a summer of considerable activity. In the Pittsburgh and tributary districts, June seems to have established a number of records for that month, notably in ingot production, shipments of flat-rolled products and probably in the production of pig iron. But this was accomplished in the face of a gradual decline in the demand for steel and may have been the result of a carryover of the high momentum of the earlier months of the year rather than an extraordinary current demand.

The gradual decline in specifications for some products was checked slightly last week, but this was more likely due to the clearing up of old contracts rather than to a general acceleration in demand. With fairly comfortable backlogs, mills are not yet unduly anxious for business, but another month will find their position somewhat changed, even though the summer decline in specifications does not reach marked proportions.

At present, operations of open-hearth furnaces are still at close to physical capacity, but a marked curtailment is scheduled this week on account of the holiday. Mills are taking advantage of the interruption to make greatly needed repairs to their equipment, and most of the sheet and tin mills in this and nearby districts will be closed down Wednesday night for the remainder of the week.

July promises to be a good month in production. Sheet orders now on company books are sufficient for more than a month's operations, and the same thing is true of plates. On other products delivery promises range from two to four weeks, and in many cases shipments have been just about equal to specifications, allowing little opportunity for improving deliveries.

Efforts of sellers of semi-finished steel to get higher prices for their products than were received in the second quarter on contract business are meeting with indifferent success. Users generally have enough steel on hand or remaining on old contracts to last for several weeks and are not anxious to assume future obligations at higher prices.

On certain finished products, notably galvanized sheets, structural shapes and cold-rolled strip, price irregularities have developed. Except in the case of galvanized sheets, this tendency is not sufficiently extended to make the market quotably lower.

Dullness still prevails in the pig iron and scrap market. Third quarter buying in pig iron still lags, although the week before last brought out some sizable inquiries, some of which are still outstanding. No. 1 heavy melting steel is still quotable at $18 to $18.50, and sales of compressed sheets in the last week have established this grade at the same level.

Pig Iron—Sales are confined largely to small lots, and buyers are hesitant about covering their third quarter requirements. No large inquiries have been reported during the week, although the Westinghouse Electric &

Mfg. Co. has not yet closed against its Trafford City, Pa., tonnage. Consumers are said to have enough iron on contract to carry ther into July, but cannot defer their purchases very long after the middle of the month. The foundry melt in this district during June was rather low, the most active users having been the steel foundries, which are busy on railroad business, and steel mill equipment makers. The same situation exists in the Valleys, where non-integrated steel companies are nearly all covered for July and August and where buying by foundries has been negligible. In the face of quiet demand, prices are steady, with small tonnages moving at the full market quotations of $18.50, Valley, for basic and foundry and $19 for malleable and Bessemer. In the immediate Pittsburgh district shading has occurred only on basic iron and on transactions in which details are lacking.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—The supply of semi-finished steel in this district has not yet become plentiful, and, with production holding close to physical limits, market interest is centered chiefly in prices. The $36 price on sheet bars, billets and slabs, which prevailed for a time on spot purchases, is no longer widely adhered to, although it is still quoted by companies which have little or no steel to spare at this time. Sheet bars are well established at $35, Pittsburgh or Youngstown, the price which prevailed on second quarter business. On billets, slabs and forging billets, the latter ordinarily carrying a $5 premium over rerolling billets, the going prices are not so clearly defined. Billets are obtainable at $35, Pittsburgh or Youngstown, but large consumers are reluctant to pay this price on their third quarter contract tonnage, as it represents an advance of $1 a ton over the second quarter price. Although a sale of slabs was reported to have been made recently in this district at $34, it seems not to have been made by a Pittsburgh or Youngstown producer, and fairly large buyers of billets and slabs in this district have not been able to get this price on their third quarter requirements. As a result, very little tonnage has been closed. Users have enough steel on contract to last them for a month or more, and until contracts are closed the price may not readily be determined. In view of the fact that sellers are nominally quoting $36 and consumers are quite willing to pay $34, the market on billets and slabs is probably most fairly represented at $35, Pittsburgh or Youngstown, a price which has been done on small transactions and which might likely become the ruling quotation if the supply of crude steel does not become more plentiful in the next 30 days.

Bars, Shapes and Plates.—New business improved in the last week of the month. In plates, June was one of the best months the industry has ever experienced. Little or no reduction in backlogs occurred during the month, and plate mills enter the second half of the year with orders sufficient for at least six weeks operations, and no decline in specifications is in view. In bars and shapes, the situation is not so good, shipments during the past month having been generally ahead of specifications. On bars, delivery promises now average about three weeks, with still better shipments possible on shapes. Fabricating shops in the district are fairly well engaged, but business is spotty, leaving plenty of room for small orders which seem to be rather scarce. Fabricated prices are also rather weak and, although this has not been generally reflected in the price of shapes, reports of occasional quotations lower than 1.95c., Pittsburgh, are not lacking. On bars, this price seems to be holding, and the plate quotation is unusually firm. Reinforcing bars are quoted at 2.05c., Pittsburgh, for 40, 50 and 60 ft. lengths, and the price is well maintained in the face of an active demand.

Rails and Track Supplies.—The Norfolk & Western is inquiring for 39,000 tons of rails, and the market is showing additional activity in view of prospective supplementary purchases by the Pennsylvania. June turned out to be a good month in the track supply business, at least from the standpoint of shipments, although specifications declined seasonably.

Wire Products.—Heavy specifications last week occasioned by the end of the quarter made the week one of the best of the year in the wire business. Demand for manufacturers' wire is holding up well in spite of the reported decline in the requirements of the automobile industry, and there is a satisfactory movement of agricultural wire products. Nails are dull, but this condition is generally accepted as permanent, and makers are no longer disappointed by unsatisfactory tonnages. Price weakness is confined to competitive districts, quotations being adhered to in the immediate Pittsburgh territory.

Tubular Goods.—The pipe market is rather quiet, with an unsatisfactory demand for the buttwelded products and little activity just now in the line pipe field. With one possible exception, no large line pipe projects are now before the trade, and oil country business leaves something to be desired. The California fields are requiring very little pipe; reports of improving demand are conflicting. The situation in the Texas and Oklahoma region is somewhat better. Demand for mechanical and boiler tubing is holding up unusually well, and prospects are good for a steady summer demand.

Sheets.—With the best six months in its history behind it, the sheet industry enters the second half of the year with orders sufficient for a month's operations, and schedules in

The Iron Age Composite Prices

Finished Steel

July 2, 1929, 2.412c. a Lb.

One week ago	2.412c.
One month ago	2.412c.
One year ago	2.341c.
10-year pre-war average	1.689c.

Based on steel bars, beams, tank plates, wire, rails, black pipe and black sheets. These products make 87 per cent of the United States output of finished steel.

F.o.b. Bethlehem	2.05c.
Del'd Cleveland	2.14c.
Del'd Philadelphia	2.01c. to 2.06c.
Del'd New York	2.14½c.
C.i.f. Pacific ports	2.35c.

Hot-Rolled Hoops, Bands and Strips

	Base per Lb.
6 in. and narrower, P'gh	2.00c.
Wider than 6 in., P'gh	1.90c.
6 in. and narrower, Chicago	2.20c.
Wider than 6 in., Chicago	2.10c.
Cooperage stock, P'gh	2.20c.
Cooperage stock, Chicago	2.30c.

Cold-Finished Steel

	Base per Lb.
Bars, f.o.b. Pittsburgh mill	2.30c.
Bars, f.o.b. Chicago	2.30c.
Bars, Cleveland	2.35c.
Shafting, ground, f.o.b. mill	*2.65c. to 3.60c.
Strips, P'gh	2.75c. to 2.85c.
Strips, Cleveland	2.75c. to 2.85c.
Strips, del'd Chicago	3.05c. to 3.15c.
Strips, Worcester	2.90c. to 3.00c.
Fender stock, No. 20 gage, Pittsburgh or Cleveland	4.25c. to 4.35c.

*According to size.

Wire Products

(Carload lots, f.o.b. Pittsburgh and Cleveland, to jobbers and retailers.)

	Base per Keg
Wire nails	$2.65 to $2.75
Galvanized nails	4.65 to 4.75
Galvanized staples	3.35 to 3.45
Polished staples	3.10 to 3.20
Cement coated nails	2.65 to 2.75
	Base per 100 Lb.
Bright plain wire, No. 6 to No. 9 gage	$2.50 to $2.60
Annealed fence wire	2.65 to 2.75
Spring wire	3.50 to 3.60
Galv'd wire, No. 9	3.10 to 3.20
Barbed wire, galv'd	3.30 to 3.40
Barbed wire, painted	3.05 to 3.15
Woven wire fence (per net ton to retailers)	65.00

Chicago district mill and delivered Chicago prices are $1 per ton above the foregoing. Birmingham mill prices $3 a ton higher; Worcester, Mass., (wire) mill $3 a ton higher on production of that plant; Duluth, Minn., mill $2 a ton higher; Anderson, Ind., $1 higher.

Cut Nails

	Per 100 Lb.
Carloads, Wheeling, Reading or Northumberland, Pa.	$2.70
Less carloads, Wheeling or Reading	2.80

Light Plates

No. 10, blue annealed, f.o.b. P'gh	2.20c.
No. 10, blue annealed, f.o.b. Chicago dist.	2.30c.
No. 10, blue annealed, del'd Phila.	2.42c. to 2.52c.
No. 10, blue annealed, B'ham	2.35c.

Sheets

Blue Annealed

	Base per Lb.
No. 13, f.o.b. P'gh	2.35c.
No. 13, f.o.b. Chicago dist.	2.45c.
No. 13, del'd Philadelphia	2.67c.
No. 13, blue annealed, B'ham	2.50c.

Box Annealed, One Pass Cold Rolled

No. 24, f.o.b. Pittsburgh	2.85c. to 2.95c.
No. 24, f.o.b. Chicago dist. mill	3.05c.
No. 24, del'd Philadelphia	3.17c. to 3.27c.
No. 24, f.o.b. Birmingham	3.00c. to 3.10c.

Metal Furniture Sheets

No. 24, f.o.b. P'gh	4.10c. to 4.20c.

Galvanized

No. 24, f.o.b. Pittsburgh	3.50c. to 3.70c.
No. 24, f.o.b. Chicago dist. mill	3.80c.
No. 24, del'd Cleveland	3.79c. to 3.89c.
No. 24, del'd Philadelphia	3.92c. to 4.02c.
No. 24, f.o.b. Birmingham	3.75c. to 3.85c.

Tin Mill Black Plate

No. 28, f.o.b. Pittsburgh	3.00c.
No. 28, f.o.b. Chicago dist. mill	3.10c.

Automobile Body Sheets

No. 28, f.o.b. Pittsburgh	4.10c.

Long Ternes

No. 24, 8-lb. coating, f.o.b. mill	4.00c.

Vitreous Enameling Stock

No. 24, f.o.b. Pittsburgh	3.90c.

Tin Plate

	Per Base Box
Standard cokes, f.o.b. P'gh district mills	$5.35
Standard cokes, f.o.b. Gary	5.45

Terne Plate

(*F.o.b. Morgantown or Pittsburgh*)
(Per Package, 20 x 28 in.)

8-lb. coating I.C.	$11.20
15-lb. coating I.C.	14.00
20-lb. coating I.C.	15.30
25-lb. coating I.C.	$16.70
30-lb. coating I.C.	17.75
40-lb. coating I.C.	19.85

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. carry the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	18
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

some cases run well into August. Hot weather curtailed production slightly during the last two weeks of June, but shipments were at a record for the month. Mills have had little opportunity to catch up on deliveries, especially of blue annealed sheets, on which six weeks is still considered a representative shipping promise. At some mills a slight recession would almost be welcomed, as wear on equipment is becoming a more important factor in production. In some cases the mid-week is being utilized for repairs. The leading interest, along with several independents, does not expect to operate its mills this week after Wednesday night. Operations last week were at about 95 per cent of theoretical capacity in this and nearby districts, a figure which approaches the physical limits of the mills during the summer months. Prices are fairly satisfactory, except on galvanized sheets, where concessions of $2 a ton from the recent minimum are still met in sales to jobbers. This develops a range of 3.50c. to 3.70c., Pittsburgh, but the market is well represented at 3.60c., with sales reported at both the top and bottom of the range. The 3.50c. price is said to be made only by companies which sell the run of the mill on sheets for roofing purposes and thus are able to realize a greater profit by shading the market $2 a ton than by offering seconds to the trade. On black sheets, the market is represented by a range of 2.85c. to 2.95c., the amount of the tonnage and the urgency of delivery usually determining the price. Blue annealed sheets and light plates are well established at the quoted prices, and concessions are seldom reported on automobile body or furniture sheets.

Tin Plate.—Specifications are still rather slow, but sentiment in the market at the end of the month was probably better than at the beginning. Crop reports are now generally more optimistic, and it is now thought that the loss in the California fruit pack will be practically offset by increased vegetable canning. No serious losses have been reported in other parts of the country, and tin plate makers are again voicing the opinion that the year will prove a record in production. Though the first five months were unusually busy ones, the recent recession in demand had threatened a more serious slump than has actually developed. The leading interest operated its mills last week at 90 per cent of capacity, a slightly better rate than was maintained by the independents. Operations will not be resumed at most mills this week after the Thursday holiday.

Strip Steel.—Shipments of strip steel in June ran from 10 to 15 per cent under May, but the month was considered satisfactory by most makers in view of the expected decline at this time of the year. Tonnage releases during the month were just about equal to shipments, so mill backlogs were not materially reduced. On the narrower widths of hot-rolled material, delivery promises average three or four weeks, but much better shipments are possible on the wider sizes. On the cold-rolled material, the situation is hardly so good. Mills are having difficulty in maintaining the quoted prices on cold-rolled strip. The 2.75c., Pittsburgh, minimum is holding fairly well, but the $2 premium asked for small orders and difficult specifications is more difficult to get, largely because a few producers are more anxious than they were to fill out production schedules.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.
Soft steel bars and small shapes	2.90c.
Reinforcing steel bars	2.75c.
Cold-finished and screw stock—	
Rounds and hexagons	3.60c.
Squares and flats	4.10c.
Bands	3.25c.
Hoops	4.25c.
Black sheets (No. 24), 25 or more bundles	3.80c.
Galv. sheets (No. 24), 25 or more bundles	4.55c.
Blue ann'l'd sheets (No. 10), 1 to 10 sheets	3.45c.
Galv. corrug. sheets (No. 28), per square	$4.43
Spikes, large	3.40c.
Small	3.80c. to 5.25c.
Boat	3.80c.
Track bolts, all sizes, per 100 count,	60 per cent off list
Machine bolts, 100 count,	60 per cent off list
Carriage bolts, 100 count,	60 per cent off list
Nuts, all styles, 100 count,	60 per cent off list
Large rivets, base per 100 lb.	$3.50
Wire, black soft ann'l'd, base per 100 lb.	$3.00 to 3.10
Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Cold-Finished Steel Bars.—Business showed a declining tendency during June, but the last week brought a check in the form of more encouraging specifications. If the present rate can be maintained in July the summer would be very satisfactory, but demand is rather spotty. Conflicting reports from the automobile industry, normally a large consumer, add to the uncertainty of the situation. Orders on mill books are sufficient for two to three weeks' operations. Prices are well maintained at 2.30c., base, Pittsburgh.

Coke and Coal.—The market on foundry coke is very quiet, and shipments last week again declined. Hot weather is partly responsible for lack of foundry activity, but slow operations among many of the large consumers in the district are fully reflected in the coke market. Merchant producers of furnace coke continue to curtail production and the market owes its apparent strength to the close adjustment of supply to demand. The price is unchanged at $2.75 to $2.85 a ton, Connellsville. Coal prices are still badly demoralized, but improvement is expected in a few weeks with the resumption of domestic demand. Pennsylvania producers have sold a small amount of Lake coal, principally in special grades, as they cannot compete with West Virginia producers in this market on the regular run of business.

Old Material.—The scrap market has passed through another quiet week, with sales confined entirely to lots of less than 5000 tons and prices well within the $18 to $18.50 range on No. 1 heavy melting steel. A very recent mill purchase at $18 on this grade might be construed as giving the market a weaker tone, but the Pennsylvania Railroad steel is said to have brought slightly more than $19. Details of this sale are not yet generally known in this district, but, as the steel is reported to have gone principally to one consumer which is usually willing to pay a 50c. premium over the market for regular No. 1 steel, the market does not seem to be quotably lower on this grade. On the other hand, sales of hydraulic compressed sheets have been made at $18.50 as well as at $18.25, an advance of 25c. a ton over last week. Compressed sheets have entered this district very freely in the last week or two, resulting in holdups at at least two points, but recent sales indicate that this has not yet had a depressing influence on the price. Sales of machine shop turnings and of borings and turnings at slightly lower prices, however, have resulted in a decline of 25c. a ton on these grades. The Baltimore & Ohio list, which will close July 8, contains 19,000 tons.

Prices per gross ton delivered consumers yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.00 to $18.50
No. 2 heavy melting steel	15.50 to 16.00
Heavy melting car sides	17.00 to 17.50
Scrap rails	17.25 to 17.75
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	16.25 to 16.75
Cast iron carwheels	16.00 to 16.50
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.50 to 13.00
No. 2 railroad wrought	18.00 to 18.50
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.25 to 11.75
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.00 to 21.50
Railr. coil and leaf springs	21.00 to 21.50
Rolled steel wheels	21.00 to 21.50
Low phos. billet and bloom ends	22.00 to 22.50
Low phos., mill plates	22.00 to 22.50
Low phos., light grades	20.00 to 20.50
Low phos., sheet bar crops	20.00 to 21.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	11.75 to 12.25
Short mixed borings and turnings	11.75 to 12.25
Cast iron borings	11.75 to 12.25
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Ohio Foundries Association, Inc., will hold its annual convention the latter part of September aboard an Ohio River steamer en route from Cincinnati to Ashland, Ky., and return. The trip is expected to take three days.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4 in. and under 10 in., Pittsburgh	$35.00
Rerolling, 4 in. and under 10 in., Youngstown	35.00

Upset hex. head cap screws, U.S.S. thread	85
Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Steel Order Books Unusually Heavy as Second Half Begins—Contracts and Specifications Large

CHICAGO, July 2.—Chicago steel mills have established a new six-months' record. Shipments for January to June, inclusive, were fully 15 per cent heavier than in the corresponding period last year, while sales and also specifications were 20 to 25 per cent larger. Order books are considerably heavier than at this time last year.

Sales in the past week were the fifth largest this year, with forward buying gaining rapidly. Mill order books are unusually heavy, and a high rate of operations seems assured for the summer months. Current sales totals are little influenced by new purchases of rails. Contracts for semi-finished steel are larger than is usually expected at the opening of the third quarter. Finished steel specifications are easily equal to the average week this year and well above the rate in 1928. Releases match shipments. Ingot production remains at capacity.

The tendency for deliveries of finished steel to improve, as noted a week ago, has been checked.

It is interesting that not a single Chicago steel mill blast furnace has been taken out of service for relining in three months nor for lack of orders since the beginning of the year.

The Chicago & North Western has postponed until fall the purchase of 1000 to 2500 box cars.

Structural awards are augmented by an award for 3000 tons for a bridge at Peoria, Ill.

Pig Iron.—Iroquois furnace No. 5 has been taken out of service for relining. Plans are to have it in blast again in 30 days. Merchant stacks now in blast are one at Duluth, two Federal and two Iroquois. Shipments from local furnaces in the past six months were the largest in history. Current releases are large, and pressure for prompt delivery is as urgent as in recent months.

Sellers' order books are large, and there is a growing disposition on the part of buyers to seek tonnage for the remainder of the year. Local furnaces are holding to $20 a ton, while offerings of boat iron are to be had at 50c. a ton less. Many foundries in this district will take more than the one holiday this week. Charcoal iron is active in lots up to 200 tons at $24 a ton, furnace. Southern iron is moving in here in small quantities.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$20.51 to 21.01
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	30.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Ferroalloys.—This market is quiet in new sales. Specifications against past commitments show little change from the average in recent weeks.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Structural Material.—Awards for the week total 7500 tons, and inquiries are for not less than 5500 tons. It is reported here that the Peoria, Ill., bridge, requiring 3000 tons, is being held in check while details of the general contract are being arranged. This market is more active both in Milwaukee and locally.

Mill prices on plain material, per lb.: 2.05c. to 2.15c. base, Chicago.

Cast Iron Pipe.—Demand for cast iron pipe in this district still drags. The outlook is none too promising, though some in the trade foresee more active inquiry toward the end of the summer months. It is reported here that pipe foundries are operating at between 60 and 70 per cent of capacity. Deliveries are prompt on most sizes. Railroads are finding little use for cast iron pipe at this time. Nor are public utilities interested in additional tonnages, but they are specifying freely against commitments made earlier in the year. Carload buyers are less numerous this week than in the closing days of June. The American Cast Iron Pipe Co. will furnish 100 tons of 6 to 10-in. pipe for Monroe, Mich., and the Alabama Pipe Co. will ship 200 tons to Niles Center, Ill. The National Cast Iron Pipe Co. has taken 24,000 ft. of 6 and 8-in. pipe for Weston, Ohio, and 400 tons of 6 and 8-in. pipe for Dearborn Township, Mich. Hinsdale, Ill., will open bids July 21 on a round tonnage of cast iron pipe for a sewage disposal plant.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Hot-Rolled Strips.—Specifications from automobile frame manufacturers are slightly smaller. Other users, however, are still taking liberal quantities. Prices are steady. Third quarter contracts bulk large.

Semi-Finished Steel.—This commodity is still scarce, and producers find it necessary to continue the practice of careful apportionment among various finishing mills. Allotment to non-integrated users is still as strict as it was a month ago. Forward contracts are well covered and in the aggregate bulk larger than at the opening of the second quarter.

Sheets.—Prices remain steady in the nearby Chicago territory. Mill quotations are 2.45c. a lb. for blue annealed sheets, 3.80c. for galvanized and 3.05c. for black sheets. Quotations are demoralized in the Southwest, where mills served by the Gulf ports and inland waterways meet in sharp competition. Buying for the third quarter continues, but the pace is slow, and, as a result, books for the coming three months are not heavy. Releases against commitments are liberal, and local hot mills continue to produce at the rate of 85 per cent of capacity. Output for this week will be curtailed because of the holiday. Jobbers are taking liberal quantities, but agricultural machinery manufacturers find their needs are not as heavy as recently. There is also more spottiness in the demand from miscellaneous sources, such as locker and light tank makers.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Rails and Track Supplies.—Foremost among rail inquiries is one for 39,000 tons for the Norfolk & Western. Western producers do not expect to participate in the tonnage. Purchases from local mills total more than 10,000 tons, 3500 tons from an Illinois railroad, 5000 tons from frog and switch makers and about 600 tons in small miscellaneous lots. Several new inquiries are in the making. Western railroads have ordered 3000 tons of track fastenings, and fresh inquiry before the trade is for not less than 9000 tons. Additional releases of standard-section rails now assures an unchanged rate of output for all of July. Track supply departments are operating at normal capacity for this time of the year. Several carloads of light rails have been ordered.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.10c. to 2.40c.
Reinforc'g bars, rail steel	1.90c. to 2.05c.
Cold-fin. steel bars and shafting—	
Rounds and hexagons	3.60c.
Flats and squares	4.10c.
Bands (¼ in. in Nos. 10 and 12 gages)	3.20c.
Hoops (No. 14 gage and lighter)	3.75c.
Black sheets (No. 24)	4.05c.
Galv. sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.35c.
Spikes, ⅜ in. and larger	3.55c.
Track bolts	4.55c.
Rivets, structural	4.00c.
Rivets, boiler	4.00c.

	Per Cent Off List
Machine bolts	60
Carriage bolts	60
Coach or lag screws	60
Hot-pressed nuts, sq., tap. or blank	60
Hot-pressed nuts, hex., tap. or blank	60
No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

Wire Products.—June shipments of wire and wire products, taken as a whole, were heavier than in any sixth month for the past six years. Deliveries for the first half have established a record in all products except nails and woven wire fencing. Demand for these last-named commodities has been spotty through most of the year, nails influenced by building operations in general, and fencing by unseasonable weather. On the whole, demand is well sustained by most users, with the exception of automobile and farm implement manufacturers. Forward contracting by the manufacturing trade has progressed rapidly, and the total of orders on producers' books compares favorably with the volume at the opening of the second quarter. Shipments to the jobbers in June were above normal and requirements are not changed as the second half opens. Wire mill output is steady at 70 per cent of capacity. Prices for nails are less steady to the west and southwest of Chicago.

Reinforcing Bars.—Building permits are still seasonably small, averaging 40 per cent below June last year. This situation is having a marked effect not only in the matter of tonnage booked, but also in prices, which lack strength because of keen competition for going tonnages. Shops have been pressed for delivery in recent weeks against old projects. This stress is growing less and new business is not sufficient to support current pending operations. On the brighter side of the market is the fact that June sales topped those of May by a fair margin, but the outlook for July is not particularly promising from the viewpoint of pending tonnage. Fresh inquiry is quiet.

Bolts, Nuts and Rivets.—Specifications are a trifle lighter, as manufacturers of farm machinery find their needs are less urgent. Users generally have not built up stocks, and only moderate assortments are in the hands of producers. Spot orders are more numerous. Prices are firm.

Old Material.—June shipments to consumers were equal to the volume in May. Brokers' books are large, and efforts are being directed largely toward covering old orders. Heavy melting steel is moving freely to local mills, which are finding less reason to reject incoming scrap. Steel foundries are operating at a steady rate, while the malleable foundry business is growing spotty. Pressure placed on sellers for prompt shipment of carloads reflects the low condition of stocks at most foundries. New demand for railroad malleable is light, and brokers are having little difficulty in obtaining this grade at $17.25 a gross ton, delivered. One mill is holding back shipments of bundles. Sellers are having difficulty in placing this tonnage as it appears on tracks. Cast iron car wheels have been purchased locally for delivery to Kokomo, Ind., at $13.60 a gross ton on track. This is equivalent to $14.10 a gross ton, delivered Chicago. The price paid at Kokomo was $16. The Chicago & North Western is offering 6000 tons.

Prices deliv'd Chicago district consumers:

	Per Gross Ton	
Basic Open-Hearth Grades:		
Heavy melting steel	$14.75 to	$15.25
Shoveling steel	14.75 to	15.25
Frogs, switches and guards, cut apart, and misc. rails	16.25 to	16.75
Hydraul. compressed sheets	13.00 to	13.50
Drop forge flashings	10.50 to	11.00
No. 1 busheling	13.00 to	13.50
Forg'd cast and r'l'd steel carwheels	18.25 to	18.75
Railroad tires, charg. box size	18.50 to	19.00
Railroad leaf springs cut apart	18.50 to	19.00
Acid Open-Hearth Grades:		
Steel couplers and knuckles	16.75 to	17.25
Coil springs	19.00 to	19.50
Electric Furnace Grades:		
Axle turnings	14.50 to	15.00
Low phos. punchings	16.50 to	17.00
Low phos. plates, 12 in. and under	16.50 to	17.00
Blast Furnace Grades:		
Axle turnings	10.75 to	11.25
Cast iron borings	9.75 to	10.25
Short shoveling turnings	9.75 to	10.25
Machine shop turnings	7.00 to	7.50
Rolling Mill Grades:		
Iron rails	16.00 to	16.50
Rerolling rails	17.50 to	18.00
Cupola Grades:

Steel rails less than 2 ft.	18.50 to	19.00
Angle bars, steel	17.00 to	17.50
Cast iron carwheels	14.00 to	14.50
Malleable Grades:		
Railroad	17.25 to	17.75
Agricultural	15.75 to	16.25
Miscellaneous:		
*Relaying rails, 56 to 60 lb.	23.00 to	25.00
*Relaying rails, 65 lb. and heav.	26.00 to	31.00
	Per Net Ton	
Rolling Mill Grades:		
Iron angle and splice bars	15.00 to	15.50
Iron arch bars and transoms	21.00 to	21.50
Iron car axles	26.00 to	26.50
Steel car axles	16.50 to	17.00
No. 1 railroad wrought	13.50 to	14.00
No. 2 railroad wrought	13.00 to	13.50
No. 1 busheling	9.00 to	9.50
No. 2 busheling	7.00 to	7.50
Locomotive tires, smooth	14.50 to	15.00
Pipes and flues	10.00 to	10.50
Cupola Grades:		
No. 1 machinery cast	14.50 to	15.00
No. 1 railroad cast	13.75 to	14.25
No. 1 agricultural cast	13.25 to	13.75
Stove plates	12.25 to	12.75
Grate bars	11.75 to	12.25
Brake shoes	10.50 to	11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Bars.—Current demands for mild steel bars are lighter by a small margin. Steel shipments to the automobile trade continue to taper, but the change is slight and the effect is noticeable mostly in the medium-priced car field, for which July shipping schedules will be sharply below those for June. Farm implement manufacturers, though feeling free to make liberal contracts, are finding less immediate need for steel. Some look on this situation solely as a seasonal influence. Forgers, though still operating at a high rate, are feeling the effects of a duller demand from automobile builders. Shipments to road machinery manufacturers have not changed in many weeks. New buying in iron bars is dull; specifications are of moderate size. The bulk of car builders' needs are filled for the present. Output of alloy steel bars is holding at 85 per cent of capacity. Prices are firm. Third quarter contracts total about the same as at the opening of the second quarter. Specifications for rail steel bars are equal to production and to shipments. Buyers are taking more interest in future needs. Mills near Chicago are operating on a double turn basis. The mill at Moline, Ill., will be down for repairs until about July 15.

Plates.—Forward contracting is active, tank builders alone in this district accounting for more than 8000 tons. A refiner in the Southwest has ordered 1500 tons of tank plates. The White Star Refining Co., Detroit, is in the market for 2000 to 3000 tons of plates. Total inquiry for tank work now before the trade is impressive at 15,000 tons. The consumption of plates is heavy in this district. Shipments are holding to the rate of recent weeks and specifications are in such size that improvement in deliveries, noted a week ago, has been checked. Western car builders appear to be at the peak of their present construction programs and their needs for steel are large. It is estimated in some quarters that they have about two months' work ahead. Plate demands for pipe manufacture are heavy.

Coke.—The Chicago market is active in spot sales. Shipments are curtailed somewhat this week as a result of the holiday, which in some instances will extend over Thursday, Friday and Saturday.

O'Fallon Decision Should Stimulate Buying

That the recent decision of the United States Supreme Court in the O'Fallon case should have a favorable effect on the general railroad situation and should stimulate the interest of carriers in acquiring new equipment is the opinion expressed by W. H. Woodin, president American Car & Foundry Co., in the thirtieth annual report of the company. Mr. Woodin states that "fortunately the company's earning capacity is not entirely dependent upon its manufacture and sale of railroad equipment. Unceasing care has been given to the extension of its business in miscellaneous products. That branch of its activities is now one of very considerable magnitude and produces a substantial proportion of its earnings."

Net earnings for the year ended April 30, 1929, were $2,715,174.28, compared with $3,754,555.05 in the previous fiscal year.

An engineering and sales office has been opened by Carrier Engineering Corporation, Newark, N. J., in the Buhl Building, Detroit, in charge of Herbert Peacock. This takes the place of temporary engineering offices in Detroit occasioned by large work in process there in air conditioning, cooling and ventilating systems. Mr. Peacock has been engineering assistant to the sales manager of the company.

New York

Pig Iron Buyers Still Cautious — Structural Activity Continues—Other Steel Buying Steady

NEW YORK, July 2.—The opening of the third quarter finds the pig iron market quiet. Sales in this district for the week totaled only 6000 or 7000 tons, and inquiries are not numerous. Inventory considerations may partly explain the attitude of buyers and a certain amount of second quarter tonnage is still to be delivered, but the general lack of interest in contracts is probably accounted for mainly by the price situation. Melters see no object in obligating themselves for the next three months when there are no indications of an advancing market. Moreover, the possibility of more active competition in this district on the part of Alabama furnaces is regarded as a further reason for caution. On the other hand, those who count on larger offerings of merchant iron by steel companies may be disappointed, since steel production promises to show little diminution in the next month or two. The inquiry for 2000 tons by the General Fire Extinguisher Co., Providence, R. I., is still open, but the General Electric Co. has closed for at least part of the 6000 tons on which it took figures. Two current inquiries calling for deliveries to plants outside of this district involve a total of 10,000 tons. Northern brands of foundry iron continue to range from $17.50 to $18, base Buffalo, or the equivalent.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	21.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.89 to 23.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Ferroalloys.—Sales of ferromanganese in the past week or two have totaled several hundred tons at the regular quotation of $105, seaboard basis. The Ford Motor Co. is inquiring for 800 tons. Demand for spiegeleisen is confined to carload and small lots. Specifications on contract for both of these alloys and for other standard ferroalloys are very heavy.

Reinforcing Bars.—The Jones & Laughlin Steel Corporation will supply 1400 tons of bars for the automobile storage building of the New York Central Railroad at West End Avenue and Sixty-fifth Street. Otherwise, awards have consisted only of small tonnages. Inquiries are scarce. Prices, however, are firm and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Although steel business continues good in nearly all branches, the structural field is leading in strictly new business. Among the projects which have come up for bids are five which total more than 25,000 tons. These are: 9500 tons for subway work, 6000 tons for a building at Fifth Avenue and Fifty-eighth Street, 4000 tons for a building for the New York Telephone Co., 3900 tons for repairs to the Queensborough bridge and 1725 tons for a New York Central Railroad viaduct. In specifications and new business, June was an exceptionally good month, though the total tonnage of most of the local steel offices fell below that of May. With respect to consumers' requirements in July and August, the general opinion is that no severe curtailment in consumption in this district is in sight. The demand for full finished and special finished sheets is especially strong.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Warehouse Business.—June sales from stock have not quite measured up to the May total, which was one of the largest for any month in the first half of the year. Business in structural steel has declined slightly, and other steel products are less active. Black and galvanized sheet prices are still subject to shading of $1 and $2 a ton. Jobbers have not yet revised their quotations on blue annealed sheets to the new mill bases.

Cast Iron Pipe.—New inquiry for pressure pipe is limited to small lots to complete contracts. Yonkers, N. Y., opens bids July 5 on 1000 tons of 12-in. and 1800 tons of 18-in. water pipe. At the recent opening of bids at Hyattsville, Md., by the Washington suburban sanitary district, on 1675 tons of 6 to 12-in. water pipe, low bids were submitted for both sand cast and centrifugally cast pipe by the United States Pipe & Foundry Co. as follows: On 10,000 ft. of 6-in., Class B, $36 a ton; Class 150, $0.4949 a ft.; 15,000 tons of 8-in. Class B, $36.60 a ton; Class 150, $0.6972 a ft.; 6000 tons of 10-in. Class B, $37 a ton; Class 150, $0.9579 a ft.; 3000 ft. of 12-in. Class B, $36.60 a ton; Class 150, $1.2425 a ft. The freight rate from Northern foundries to the Washington district is about $3.70 a net ton.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $35.60; 4-in. and 5-in., $36.60 to $38.60; 3-in., $43.60 to $45.60. Class A and gas pipe, $3 extra.

Coke.—Demand is light and prices are unchanged. Standard furnace is quoted at $2.75 to $2.85 a net ton, Connellsville. Special brands of beehive coke are $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 per net ton, Newark or Jersey City and $10.06, New York or Brooklyn.

Old Material.—No. 1 heavy melting steel is being bought by brokers at

No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.00 to 13.50
Cast iron carwheels.....	12.00 to 12.25
Stove plate (foundry)....	8.25 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

E. Arthur Tutein, Inc., Awarded $302,500

E. Arthur Tutein, Inc., of Boston and New York, has been awarded a verdict of $302,500 by the arbiters in the proceeding brought against the Hudson Valley Coke & Products Corporation, Troy, N. Y.

The Tutein company was appointed agent for the Troy blast furnace and coke ovens in the sale of pig iron and coke, but the contract was terminated with some years still to run, and the Tutein company brought action under an agreement by which any disputes were to be submitted to arbitration.

Sherman Whipple, Boston lawyer, was arbiter for the Tutein company and United States Senator Wagner of New York served in like capacity for the Hudson Valley company. The third arbiter, Louis K. Comstock of New York, was appointed by Charles M. Schwab in his capacity of president of the American Iron and Steel Institute, a mode of selection which the arbitration contract called for.

It is stated that the damages assessed against the Hudson Valley company are for lost profits and do not cover an investment of $250,000 which E. Arthur Tutein made in the stock of the company.

In May jobbing foundries of Worcester, Mass., and vicinity produced 5,231,926 lb. of gray and malleable iron castings, the largest month's total thus far this year. Compared with May, 1928, the increase was from 3,683,065 lb., or 41.8 per cent.

Cleveland

Large Steel Operations Through July Assured By Present Backlogs—Automotive Orders Continue to Decline

CLEVELAND, July 2.—July started with enough business in finished steel on mill books to assure good operations through the month, although some of the sheet and strip mills could take on additional tonnage for late in July. Backlogs have been reduced and deliveries on most products have improved. However, not much gain has been made in shipments of steel bars, for which there is still pressure for delivery. Plate mills also have backlogs.

The volume of specifications the past week showed little change from recent weeks. Consuming industries outside the automotive field appear to continue at recent operations, and the demand for steel is expected to hold up well during the summer months.

Orders from the automotive industry continue to decline. With the seasonal slowing down in that field and curtailment due to bringing out new models, the July output of cars will show a sharp decline from that of June.

Quite a few parts manufacturers have received suspensions or cancellations that are reducing their operations. However, the industry will be well sustained during the summer months by production of some of the makers of low-priced cars. The July schedule of the Ford Motor Co. is understood to call for the production of 190,000 cars, or an increase over recent months.

With better mill deliveries and uncertainty over future schedules automobile companies are not buying steel for as extended requirements as a few weeks ago. Most consumers of steel bars, plates and structural shapes have covered with third quarter contracts. Waiving of chemical extras is reported in some cases on spring steel, but base prices are firm.

Structural inquiry is fair. Awards during the week included 4000 tons for a Toledo bank.

The Nickel Plate Railroad has placed 1000 tons of rails and the Wheeling & Lake Erie 1500 tons with a Pittsburgh district mill, supplementing their purchases early in the year. Steel bars are quoted at 1.95c., Cleveland and Pittsburgh, and plates and structural material at 1.95c., Pittsburgh.

Pig Iron.—Sales increased during the past week. Cleveland interests took orders for 36,000 tons of foundry and malleable iron, as compared with 17,000 tons in the previous week. An Ohio foundry purchased 4000 tons for last half. This company inquired for the same amount of iron for the first half of 1930, but furnaces declined to quote for shipment beyond January. The General Electric Co. closed for 1200 tons of foundry iron for its Erie works, and another Erie consumer bought 1000 tons. The inquiry from the Westinghouse Electric & Mfg. Co. for foundry iron for its Cleveland plant is still pending. Foundries, with few exceptions, are confining their purchases to the third quarter, and furnaces are not attempting to make sales for the entire last half. With the steady buying that has been going on for a number of weeks, most producers have a very good backlog of third quarter business. June shipments declined only about 10 per cent from those of May.

Shipping orders to the automotive industry and other consumers have started this month at about the same rate as during June. Little interest is being taken in prices, as quotations that have prevailed for some time are being maintained. Cleveland furnaces quote foundry and malleable iron at $18.50, furnace, for outside shipment and at $19 for local delivery. In Michigan, the market is $20 on both grades. A sale of 200 tons of Southern foundry iron at $15, Birmingham, for shipment into this territory seems to establish that as the ruling price for small-lot business.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25...	21.00
Malleable	19.50
Ohio silvery, 8 per cent...	29.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Iron Ore.—The heavy movement of ore from the Lake Superior district, which started with the opening of navigation, continues. Shipments by water during June were 10,174,424 tons, an increase of 1,248,208 tons over June, last year. The total movement until July 1 was 22,239,938 tons, a gain of 7,944,813 tons, or more than 55 per cent above the same period last year.

Sheets.—With the decrease in the demand from the automotive industry, mill backlogs have been materially reduced, and some producers now need orders for auto body sheets, having only enough to keep their hot mills busy for two weeks. Some mills have also well caught up on black sheets. Others are well filled for from four to six weeks. Orders for round tonnages of auto body and black sheets for manufacturing 80,000 bodies for Chevrolet cars were distributed among several mills during the week. Good orders also came from barrel manufacturers. Resistance to the 2.95c., Pittsburgh, price on black sheets has become more pronounced, and 2.85c. is now fairly common. On galvanized sheets, 3.60c. has become more general. While there has been only slight reduction in mill operations, a number of mills

will not resume operations after the holiday shutdown until next Monday.

Strip Steel.—Specifications for both hot and cold-rolled strip have fallen off considerably, and deliveries are much better than recently except on hot strip in very narrow sizes, of which some of the mills have enough business on their books to carry them through August. Deliveries on wide hot-rolled strip can be secured in two weeks and on cold-rolled material in three weeks. Prices are firm. Most consumers have covered for the third quarter at regular quotations.

Alloy Steel.—Specifications were heavy during the last few days of June, considerable business being brought out by the price advance effective on third quarter contracts on small billets and slabs in certain sizes that resulted from putting these on a bar base. Mills also took a good volume of specifications for bars for July shipment. However, mill backlogs have been reduced considerably by the decreased demand from the automotive industry. Prices are firm.

Semi-Finished Steel.—There has not been much contracting for the third quarter, but contracts that have been closed have been at $35, Cleveland and Youngstown, for sheet bars, billets and slabs. This is the same price at which sheet bar contracts were written for the second quarter, but is an advance of $1 a ton for billets and slabs. That consumers are rather slow in placing contracts is evidently due partly to the fact that those receiving their supplies from a Cleveland mill will be securing shipments for about three weeks against second quarter contracts, as that producer is that far behind on deliveries. Until these shipments are completed these buyers will be getting billets and slabs at the $34 price.

Bolts, Nuts and Rivets.—June made a good showing in bolt and nut orders, but the volume of business was considerably less than in May. That the market will experience the usual seasonal decline in July is indicated by a further falling off in orders in the past few days. Production has been curtailed, manufacturers now operating their plants from 65 to 70 per cent of capacity. Rivet orders also show a decline. Prices are firm.

Coke.—Prices on some of the cheaper grades of Connellsville foundry coke have declined about 25c. a ton, but the better grades are firm at recent quotations. Ohio by-product coke is quoted at $8.25, Painesville, for July shipment. Specifications are fair.

Cold-Finished Steel.—Demand for screw stock has declined materially, but orders for alloy and high carbon wire from cap and set screw makers continue heavy, and deliveries on such material show no improvement.

Wire Products.—Nails are irregular, with $2.50 a keg not an uncommon price. Recent weakness in wire seems to have disappeared. Specifications are rather light.

Warehouse Business.—New extras on blue annealed sheets were generally adopted July 1. The base is unchanged at 3.25c. Warehouse business continues fairly good.

Old Material.—While the market is dull, most prices are holding to recent quotations. No. 1 heavy melting steel will be supplied to a Valley district mill during July at $17.50, the same price that it paid during June. Dealers are paying $17.50 to $17.75 for the heavier grades of No. 1 heavy melting steel to cover $18 contracts with Youngstown district mills. A Cleveland mill which has been restricting shipments of steel making scrap has cut off shipments entirely on this grade of material, evidently because of large stocks that it has accumulated in water shipments from Detroit. Dealers are buying blast furnace scrap in moderate quantities for shipment to a Cleveland consumer at quoted prices. Cast scrap is lower.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	14.50 to 15.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.25 to 9.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.00 to 13.50
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos. plate scrap	18.00 to 18.50
Blast Furnace Grades	
Cast iron borings	10.75 to 11.00
Mixed borings and short turnings	10.75 to 11.00

Philadelphia

Sheet Prices Less Firm—Billet Market Steadier at $35 for New Contracts—Pig Iron Quiet

PHILADELPHIA, July 2.—Steel contracting for third quarter has been at about the same level as in the previous quarter. Specifications from consumers have been lighter recently, but mill operations are being maintained at a high level with deliveries slightly earlier than a few weeks ago. While production at certain steel mills has been curtailed somewhat in the past few weeks, the reduction has been largely necessitated by repairs to open-hearth furnaces, which will be returned to production as soon as possible.

Concessions of $1 to $2 a ton in the prices of black and galvanized sheets have become rather general.

Pig Iron.—Foundry iron prices are being maintained at $21 to $21.50 per ton, furnace, eastern Pennsylvania producers showing no inclination to meet the quotations of Southern sellers. Sales of Southern pig iron have been limited to occasional small lots of foundry and some trial shipments of basic bought a number of weeks ago. In many cases consumers are apparently unwilling to change the analysis of iron in their mixture, as the present low prices for Birmingham iron are considered a temporary condition, which will disappear when the present large stocks in the Birmingham district have been reduced. A test of the present price of eastern Pennsylvania iron appears likely from the inquiry of the National Radiator Co., Johnstown, Pa., for 3500 tons of foundry for its Trenton, N. J., plant. No sales of basic have been made since the recent purchase of 10,000 tons by a Claymont, Del., consumer at about $20 per ton, furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.76 to $22.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	22.26 to 22.76
East. Pa. No. 1X	22.76 to 23.26
Basic (del'd east. Pa.)	20.25 to 21.00
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Following a few extensions of contracts into third quarter at $34 a ton, Pittsburgh, for rerolling billets, although $36 had been announced as the third quarter contract price, the market has apparently become stable at $35 a ton, Pittsburgh, for rerolling

billets and $40, Pittsburgh, for forging quality. Consumers are reported as well supplied with stocks, and, with shipments coming to them on old contracts, they are in most cases covered for part of this month.

Bars.—Contracting has been slightly less in volume for third quarter, partly because of diminished buying by automobile manufacturers. Deliveries have been reduced to two and three weeks for ordinary specifications. Mills are maintaining a high rate of operation. New contracts are being made at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia.

Shapes.—Mills have fair backlogs, but deliveries can be had in from one to two weeks, depending upon the specification. Prices are still irregular, ranging from 1.95c. to 2.05c. a lb., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c. a lb., delivered Philadelphia.

Plates.—Third quarter contracting has been substantial, and, if consumers specify as freely as in the past quarter, continued operation at full capacity is expected. Railroads and car builders are providing substantial business. Quotations are unchanged at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Although automobile body builders are not buying so freely as in the second quarter, blue annealed sheet prices are being maintained with No. 13 gage at 2.35c. a lb., Pittsburgh, or 2.67c., delivered Philadelphia, and light plates, blue annealed, at 2.20c., Pittsburgh, or 2.52c., Philadelphia for No. 10 gage. Large preferred buyers, such as automobile body builders, usually obtain concessions of $2 a ton or more. Shading of black and galvanized sheet prices is increasing, and sales have been made at 2.85c. to 2.90c. a lb., Pittsburgh, or 3.17c. to 3.22c., Philadelphia, for black and at 3.60c. to 3.65c., Pittsburgh, or 3.92c. to 3.97c., Philadelphia, for galvanized.

Warehouse Business.—June has compared favorably with May in the total of shipments from stock, but the latter part of the month brought a slight decline in business. Prices are well maintained.

Imports.—In the week ended June 29, arrivals of chrome ore at this port totaled 2855 tons, of which 2500 tons was from Portuguese Africa and 355 tons from British India. Imports of Algerian iron ore amounted to 6600 tons. Steel imports consisted of 346 tons of structural shapes, 52 tons of steel bars and 60 tons of steel bands from Belgium, 18 tons of steel rods from Germany, four tons of drill steel from Sweden and 24 tons of steel scrap from the United Kingdom.

Old Material.—No. 1 heavy melting steel is quotable at $16.50 per ton on the basis of recent purchases. The available supply of good No. 1 steel is said by dealers to be sufficient at the present level of prices, but efforts to buy at lower prices result in curtailment of the tonnage secured. Specification pipe has been bought by a Lebanon, Pa., consumer at $15 a ton, delivered, a decline in the price of 50c. a ton. The latest purchase of stove plate by a Harrisburg mill was at $12 a ton, delivered. On a recent sale of steel shafting the price was $19.50 a ton, and this was followed by further small sales at $19 a ton, delivered.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel		$16.50
Scrap T rails		16.00
No. 2 heavy melting steel	$12.50 to	14.00
No. 1 railroad wrought	16.00 to	16.50
Bundled sheets (for steel works)		11.50
Hydraulic compressed, new	14.50 to	15.00
Hydraulic compressed, old	12.00 to	12.50
Machine shop turnings (for steel works)		11.50
Heavy axle turnings (or equiv.)	14.00 to	14.50
Cast borings (for steel works and roll. mill)	11.00 to	11.50
Heavy breakable cast (for steel works)		15.00
Railroad grate bars	12.00 to	12.50
Stove plate (for steel works)	11.50 to	12.00
No. 1 low phos., hvy., 0.04% and under	22.00 to	23.00
Couplers and knuckles	20.00 to	21.00
Rolled steel wheels	20.00 to	21.00
No. 1 blast f'nace scrap	10.50 to	11.00
Wrot. iron and soft steel pipes and tubes (new specific.)		15.00
Shafting	19.00 to	19.50
Steel axles	23.00 to	23.50
No. 1 forge fire		14.00
Cast iron carwheels	16.00 to	16.50
No. 1 cast	16.50 to	17.00
Cast borings (for chem. plant)		14.50
Steel rails for rolling	16.50 to	17.00

Chicago Steel Companies Object to Southwest Rates

Chicago district iron and steel interests, in cooperation with the Chicago Association of Commerce, have filed with Interstate Commerce Commission a brief against attempts by Eastern railroads to discriminate further against the Middle West in rates on iron and steel shipments to the Southwest. Suspension of proposed rates is asked pending further investigation.

The proposed lower tariffs, filed by the New York Central, Pennsylvania, Erie and Baltimore & Ohio, would establish new lower rail-water rates to Louisiana, Oklahoma, Texas and Arkansas from Wheeling, W. Va., and Cleveland, Canton and Youngstown, Ohio. These new schedules on shipments via steamship lines from North Atlantic ports to Gulf ports and the rail lines beyond would be, it is contended, on a lower basis than prescribed by the commission to cover all-rail routes from Chicago.

It is the contention of Chicago interests that no changes should be made in the present rail-water-rail adjustment to the Southwest until the commission decides the general case now pending and involving rates on all freight traffic between the East and Southwest.

Forecast Record Third Quarter in Motor Cars

Completing the greatest first half year of its history, the automotive industry enters the third quarter with every indication that business will continue at a high rate, says *Automotive Industries*, Philadelphia. Many motor car leaders who have made a careful analysis of the market predict that the third quarter will likewise set an all-time production mark when compared with the third quarter of other years. Sales leaders indicate that the demand for new cars is becoming well distributed throughout the country.

New car stocks, which were built up as a result of the record output, apparently reached the peak at the start of the spring selling season, and with a strong retail demand continuing, the number of cars in the field has been gradually reduced as the season progressed. However, there are more cars in the field now than there were a year ago. A large part of the increase can be attributed to Ford, whose stocks at the corresponding period last year were not a factor. Indications are that there is a slight increase in the number of new cars in the field other than Fords, but the increase is so close to the retail demand that the situation as a whole is not alarming.

As in former years, many manufacturers will start to reduce production during July. Manufacturers who are preparing new models for introduction will operate at a high production rate, which will have a tendency to stabilize the production figure of the industry as a whole on a high plane.

An attractive pamphlet of 32 pages has been issued by C. O. Bartlett & Snow Co., 6200 Harvard Avenue, Cleveland, entitled "The Foundry Book." It is designated Bulletin No. 63 and is elaborately illustrated. It describes various types of equipment for mechanically operated foundries, which, it is claimed, result in increased production and decreased costs. Foundry sand conditioning and mold conveying equipment predominates.

Pacific Coast

Steel Demand Continues Active—10,000 Tons of Plates Required for Pipe Line—Prices Steady

SAN FRANCISCO, June 29 (*By Air Mail*).—During the first half of the year awards of cast iron pipe, bars, plates and shapes, as reported each week in THE IRON AGE, exceeded or equalled the aggregate placed during the first half of 1928. A decided increase in the tonnage of plates and shapes booked to date this year was noted over the corresponding period of last year, the totals, as compiled from known projects, being 179,676 tons for the first half of this year and 87,075 tons for the same period a year ago.

Demand continues active. Important developments of the week included the award of 3570 tons of plates for oil storage tanks in Los Angeles and the placing of 4500 tons of shapes for the Shell Oil Building, San Francisco. Prices generally are holding firmly to levels established some time ago.

Pig Iron.—Foundry operations both in the bay district and in the southern part of the State have increased somewhat, and demand for foundry iron is improving. No large sales or inquiries are reported, but importers and dealers say that orders are more numerous. About 1300 tons of Indian iron has arrived on the Coast to be applied against contracts placed some time ago. Prices are unchanged.

Prices per gross ton at San Francisco.

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—During the first half of this year 42,100 tons of reinforcing steel bars was reported placed. This compares with 41,834 tons for the same period last year. The largest letting of the week was 2550 tons for the Cushman dam project at Tacoma, placed with an unnamed interest. A paving project in San Diego County, Cal., required 156 tons. Pending business is of fair proportions and includes 256 tons for a bridge over the Salinas River and 208 tons for paving in Alameda County, Cal. In the San Francisco district, 2.20c., base, applies on lots of 250 tons or more, 2.30c., on carload lots and 2.60c. on smaller tonnages. Merchant bar material continues unchanged at 2.35c., c.i.f., though demand is far from active, most sales and inquiries being limited to small lots.

Plates.—Interest this week centers in the call for bids for a 48-in. riveted steel pipe line for the Cedar River project in Seattle, involving 10,000 tons of plates. Bids on this work will be opened July 5. The Western Pipe & Steel Co. took 15 118,000-bbl. oil storage tanks, calling for 5370 tons, for the Texas Oil Co. This company also secured 400 tons for three gas holders for the Pacific Gas & Electric Co. at Hayward, Cal. Prices appear to be firm at 2.35c., c.i.f.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ¾-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Shapes.—The largest structural award of the week went to the Moore Dry Dock Co. and called for 4500 tons for the Shell Oil Building, San Francisco. The McClintic-Marshall Co. took 850 tons for a Medical-Dental Building in Phoenix and 350 tons for a bridge in San Bernardino, Cal. An overhead crossing at Barstow, Cal., and a viaduct in Tacoma, Wash., were placed, involving 605 tons and 576 tons respectively. New inquiries include 252 tons for two bridges for the Pacific Electric Railway, Los Angeles, and 2700 tons for two hotels in San Francisco. Bids were opened on 630 tons for a bridge over the Salinas River in California. No change in quotations on plain structural shapes is noted, 2.35c., c.i.f., being firm.

Cast Iron Pipe.—The only award of over 100 tons reported this week called for 224 tons of 12-in. Class D pipe for the improvement of Westlake Avenue North, Seattle, Wash., and was placed with Argentieri & Colorossi. B. W. Kuhn was low bidder on 208 tons of 4-in. Class C pipe for the improvement of Coldwater Canyon Road, Los Angeles. The United States Pipe & Foundry Co. was low on 1425 tons of 8-in. Class B pipe for Los Angeles, and the Grinnell Co. was low on 1148 tons of 24-in. Class C pipe for the same city. San Diego, Cal., will open bids on July 8 for 145 tons of 4 to 12-in. Class B pipe. The East Bay Municipal Utility District, Oakland, will open bids on July 3 for 260 tons of 12-in. pipe. Santa Monica, Cal., will open bids on July 18 for 185 tons of 4 to 12-in. Class B pipe.

Coke.—About 5000 tons of English beehive and by-product foundry coke arrived on the Coast this week.

Boston

Pig Iron Prices Still Unsettled—Export Movement of Scrap Gains as Domestic Mills Hold Up Shipments

BOSTON, July 2.—The General Fire Extinguisher Co., Providence, R. I., last week failed to close on 2000 tons of No. 2X and No. 1X pig iron, and action on 2000 tons of three grades of iron wanted by the Chapman Valve Co., Springfield, Mass., has been deferred two weeks, while the General Electric Co. apparently is in no hurry to close on its Lynn and Everett, Mass., third quarter requirements. Consequently the price situation is still more or less unsettled. Sales the past week totaled about 6000 tons, and included 1000 tons for a General Electric Co. New Jersey plant and 750 tons for its Pittsfield, Mass., plant; a round tonnage of malleable for a Bridgeport, Conn., foundry; as well as several 200 and 300 ton lots to various companies. In addition to 2000 tons of No. 2X and No. 1X for Providence, the General Fire Extinguisher Co. will take 500 tons of malleable for its Toronto foundry. A Connecticut maker of fittings recently purchased 1200 tons of Buffalo malleable.

Stove bolts	70 and 10

*Including quantity differentials.

Foundry iron prices per gross ton deliv'd to most New England points:

*Buffalo, sil. 1.75 to 2.25	$22.41 to $23.41
*Buffalo, sil. 2.25 to 2.75	22.91 to 23.91
East. Penn., sil. 1.75 to 2.25	24.65
East. Penn., sil. 2.25 to 2.75	25.15
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
Ala., sil. 1.75 to 2.25	21.91 to 23.77
Ala., sil. 2.25 to 2.75	22.41 to 24.27

Freight rates: $4.91 all rail from Buffalo; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.

Reinforcing Bars.—Current sales of billet steel reinforcing bars are in small tonnages. Competition for business is keen, but sellers are holding to 2.66½c. a lb., base, from stock. The market for rail steel bars is quiet, with some withdrawals of prospective tonnages from the market. The open-

ly quoted price for such bars is 2.26½c. per lb., base, delivered common Boston freight rate points.

Cast Iron Pipe.—New Haven, Conn., is reported to have closed on 3000 tons of 42-in. pipe with an Eastern foundry. East Providence, R. I., has bought 120 tons of 6 and 8-in. pipe from the Warren Foundry & Pipe Co. Boston bought 396 ft. of 12 and 16-in. from R. D. Wood & Co. Hopkinton, Mass., closes bids July 9 on 1000 tons of pipe and fittings and will also buy pumping equipment, hydrants, valves and valve boxes. Woodsville, N. H., is about to purchase 1500 tons of 10 and 12-in. pipe, and Ossipee, N. H., will place a round tonnage of 6-in. Salem, Mass., closed bids July 2 on 100 tons of 6 and 8-in. pipe. The market for 4-in. pipe is firm at $47.10 a ton, delivered common Boston freight rate points, and 6 to 12-in. at $43.10, but that for 16 to 20-in. pipe is unsettled at $42.10. A $3 differential is asked on Class A and gas pipe.

Old Material.—The holding up of shipments by three or four Pennsylvania steel mills has slowed down the scrap market somewhat, but, owing to the scarcity of most materials, prices, with the exception of those for pipe, are holding firmly. Rails for rerolling are higher, and there is less of a spread in quotations for forge flashings. The falling off in business for domestic delivery is more than offset by increased activity in the export market. The steamer Emperor, which completed loading 2500 tons of scrap some time ago, last week sailed for Skeltin, Germany; another steamer with 1464 tons cleared June 27 for Danzig. Another steamer will arrive this week to load 3500 tons for Danzig, to be followed by one steamer to load 1500 tons, also for Danzig. Until last week all exports of scrap were by tramp steamers. Arrangement has been made with a regular line of steamers to export approximately 1500 tons monthly or fortnightly to Danzig, depending on the amount of material available.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.00 to $12.25
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.25
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.50 to 6.60
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	9.50 to 10.25
Forge flashings	10.00 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.75 to 9.00
Shafting	14.00 to 14.25
Steel car axles	17.00 to 17.50
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 12.75
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.50 to $14.75
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.50 to 12.00
Railroad malleable	18.50 to 19.00

Cincinnati

Pig Iron Consumers Slow to Cover Forward Requirements —Specialty Sheets in Good Demand

CINCINNATI, July 2.—Sales of pig iron in June were well up to the May level, but slightly below the usual end of the quarter volume. Except for a sale of 3000 tons of Northern iron to a southern Ohio melter for second half, orders were for small quantities for third quarter needs. Although Northern iron has been firm at about $18.50, base furnace, continued weakness of Southern iron and the reluctance of some consumers to cover for third quarter requirements have made dealers uneasy, giving the Northern market a slight undertone of softness. Shipments on current contracts in June also were about equal to the May volume, but the demand is expected to slump during July, when melters dispose of surpluses before the annual inventory period. A Michigan consumer is reported to have placed an order for 1000 tons of silvery.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	18.69 to 19.19
Ala. fdy., sil. 2.25 to 2.75	19.19
Tenn. fdy., sil. 1.75 to 2.25	19.19
S'th'n Ohio silvery, 8 per cent	27.89 to 28.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—While the volume of new business for foundry coke during the past month slumped noticeably, specifications on current contracts have been better than in the preceding 30 days.

Finished Material.—A well sustained demand for specialty sheets, especially from electrical manufacturers and for metal furniture, is keeping district mills at capacity production. Following the annual shutdown during this month, the trade anticipates a demand for sheets equal to the capacity of mills. Production of cold-rolled strip is catching up with the demand as a result of a reduction in bookings from automobile manufacturers. Mills are now making deliveries on cold-rolled strip in four to six weeks.

Old Material.—Continued steadiness of prices of scrap iron and steel has brought the market into a firmer position. Shipments against contracts have been sustained, but new business has been in small lots for immediate use.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.00 to $13.50
Scrap rails for melting	13.75 to 14.25
Loose sheet clippings	9.25 to 9.75
Bundled sheets	10.50 to 11.00
Cast iron borings	9.00 to 9.25
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	6.75 to 7.00
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.00 to 13.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.25 to 19.75
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Railroad malleable	15.25 to 15.75
Agricultural malleable	14.25 to 14.75

Canada

Third Quarter Buying of Pig Iron Gains

TORONTO, ONT., July 2.—New business has gained in the Canadian pig iron markets during the past week or 10 days. A number of large tonnage contracts have been placed. According to local blast furnace representatives, upward of 80 per cent of those who place contracts are now covered for third quarter. Others are coming forward, and it is expected that the majority will have booked up by the end of next week. In addition to those who have placed orders for the entire quarter, a number of melters have made known their requirements for the next six weeks. While forward buying has been active, sales on spot account have slumped. Canadian pig iron prices continue firm. Producers have again introduced the 50c. differential on No. 1 over No. 2 foundry iron, with No. 1 now quoted at $24.60 and No. 2, $24.10, Toronto.

Prices per gross ton:

No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—While the demand for structural steel continues steady and in large total volume, new orders for the week were chiefly confined to lots under 1000 tons. Building activities throughout Canada are brisk and large tonnages of steel are on order. The steel work on the new Canadian Bank of Commerce Build-

ing at Toronto, involving 15,000 tons, will be started almost immediately. Several other large structures are in prospect, and it is estimated that projects to be closed within the next month or six weeks exceed 30,000 tons.

Old Material.—The demand is comparatively small, with new business mostly confined to spot orders. Forward buying is at a standstill. The demand for heavy melting steel and turnings in the Montreal district is on the decline. Iron scrap grades continue to move in fair volume. Prices are firm but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00
Heavy axle turnings	8.00	7.50
Cast borings	7.50	5.00
Steel turnings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00
Axles, wrought iron	17.00	22.00

No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Youngstown

Some Mill Shutdowns for Holiday and Repairs

YOUNGSTOWN, July 2.—Mill schedules for the first week in July are interrupted by suspensions for holiday observance. Mill managers will take advantage of the lull to make repairs to rolling mill equipment. Sheet mills, for the most part, will suspend Wednesday afternoon for remainder of the week. Of 120 sheet mills in the Mahoning Valley, 106 started rolling on Monday.

Strip mills, on the other hand, will suspend for Thursday only and will start again Friday morning. Of the 20 pipe mills in the Valley, 13 started the week and will stop for the Fourth only. Tube mill operations are much better than early in the spring, with an improved outlook for the next few months.

Blast furnace schedules are reduced, owing to the blowing out of No. 4 stack in the Ohio Works group of the Carnegie Steel Co. for relining, leaving 30 of 34 blast furnaces in this area in action.

Independent tin mills suspend for the week in this district. The A. M. Byers Co. likewise suspends its puddle mill operations at the Girard works down for the full week.

The Youngstown Sheet & Tube Co. and the Republic Iron & Steel Co. are maintaining production at between 80 and 90 per cent, with the Carnegie Steel Co. averaging from 85 to 88 per cent.

St. Louis

Southern Price Reduction Stops Pig Iron Buying Movement—Steel Operations Continue Virtually at Capacity

ST. LOUIS, July 2.—The price reduction of 50c. a ton on Southern iron had the effect of abruptly ending a buying movement which began in the preceding week. Melters are now holding off on placing their requirements for third quarter. A leading Southern maker sold 750 tons to various melters at the reduced price. The Granite City maker sold only about 2500 tons, including 1000 tons to a jobbing foundry in Illinois, 800 tons to an implement manufacturer and 450 tons of malleable to a Tennessee melter. Shipments of the Granite City maker for the first 26 days in June averaged 1126 tons daily, compared with 1115 daily in the same period in May.

Finished Iron and Steel.—All departments of the Granite City Steel Co. are being operated at capacity, with the exception of tin plate, on which the rate is 85 to 90 per cent. While the company's specifications for June were not quite as heavy as in May, they were equal to shipments. Demand for galvanized sheets continues good, and this item is expected to show strength during the third quarter. Business in structural steel expected as a result of the settlement of the building strike has not materialized. The Laclede Steel Co. got an order for 300 tons of rail steel reinforcing bars for the Kirkwood Hotel, Des Moines, Iowa. The only pending project is 500 tons of reinforcing bars for a building for Kenrick Seminary, near here.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	19.42
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Old Material.—The market for old materials is dull. Dealers complain of a scarcity of material. There is very little coming in from Southern dealers because of hot weather. Railroad lists are light. Consumers are buying, but dealers are unwilling to sell any considerable tonnages at prevailing prices. Railroad lists: Pennsylvania, 46,892 tons; Union Pacific, 2500 tons; Big Four Lines, 1100 tons; Missouri Pacific, 100 carloads; Mobile & Ohio, 26 carloads; Nickel Plate, 32 carloads; Frisco, 14 carloads; Nashville, Chattanooga & St. Louis, 10 carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	12.75 to 13.25
No. 1 locomotive tires	15.00 to 15.50
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	15.50 to 16.00
Railroad springs	17.00 to 17.50
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	16.00 to 16.50
Machine shop turnings	8.00 to 8.50
Heavy turnings	9.75 to 10.00
Steel car axles	19.00 to 19.50
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.50 to 18.00
Steel angle bars	14.25 to 14.75
Cast iron carwheels	14.25 to 14.75
No. 1 machinery cast	15.50 to 16.00
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	15.00 to 15.50
Stove plate	11.50 to 12.00
Agricult. malleable	15.00 to 15.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shafting, screw stock	3.75c.
Black sheets (No. 24)	4.25c.
Galv. sheets (No. 24)	5.10c.
Blue ann'l'd sheets (No. 10)	3.45c.
Black corrug. sheets (No. 24)	4.30c.
Galv. corrug. sheets	5.15c.
Structural rivets	3.95c.
Boiler rivets	3.95c.
	Per Cent Off List
Tank rivets, ⅞-in. and smaller, 100 lb. or more	65
Less than 100 lb.	60
Machine bolts	60
Carriage bolts	60
Lag screws	60
Hot-pressed nuts, sq., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50
Hot-pressed nuts, hex., blank or tapped, 200 lb. or more	60
Less than 200 lb.	50

Detroit Scrap Unchanged

DETROIT, July 2.—There have been no price changes on scrap in this district during the past week. Due to change of models in the automotive industry and the holiday this week, production of old material for the month will probably show 10 to 15 per cent decline, as compared with last month.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$13.75 to $14.25
Borings and short turnings	9.00 to 9.50
Long turnings	7.50 to 8.00
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.50 to 14.00
Stove plate	9.00 to 9.50
New No. 1 busheling	12.00 to 12.50
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.50 to 9.00
Flashings	12.50 to 13.00

A. M. Byers Co., Pittsburgh, has awarded a contract for design and construction of two special open-hearth tilting slag melting furnaces, for use at its new Ambridge, Pa., plant, to S. R. Smythe Co., Inc., Oliver Building, Pittsburgh.

Birmingham

Pig Iron Inquiries Increase—Light Shrinkage in Some Steel Orders Offset by Gains Elsewhere

BIRMINGHAM, July 2.—Pig iron buying has been on a conservative basis in the 10-day period since books were opened for the third quarter at the base price of $15. Orders have been in moderate lots. The principal development during the past week was a marked increase in inquiries. Several open inquiries involving large tonnages are reported. Negotiations are under way for important tonnages for outside points. Shipments continue in about the same volume, though foundries are working on small stocks. Of the 17 furnaces in blast, nine are on foundry, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$15.00
No. 1 fdy., 2.25 to 2.75 sil.	15.50
Basic	15.00

Finished Steel.—A light shrinkage in orders in some lines is being offset by increases in others. Sheet bookings are beginning to gain with the approach of the regular mid-summer buying period. The Tennessee company has received an order from the Southern Pacific Railroad for 13,168 tons of rails, and inquiries are still numerous. Improvement is reported in railroad accessory buying. Mill operations in the district continue at the same high rate as in June. Several fabricated structural steel orders in lots less than 400 tons have been received. The Ingalls Iron Works Co. has booked an order for 350 tons for the S. H. Kress Co. store at Montgomery, Ala. New orders of the Virginia Bridge & Iron Co. include 300 tons for addition to the Pepperell Mfg. Co. plant at Opelika, Ala.; 120 tons for plant of Cadet Knitting Mills at Columbia, Tenn., and 150 tons for highway bridges in Winston County, Ala. Reinforcing bar demand is up to the average of recent weeks. Twenty-two open hearths are active, the same as a week ago.

Cast Iron Pipe.—A normal run of small orders, interspersed with a few round tonnages from distant points, maintained backlogs through late June. The American Cast Iron Pipe Co. booked an order for about 2200 tons for Los Angeles and shared in the Philippine tonnage to the extent of 4500 tons. Contracts have not been announced on the 6650 tons for New Orleans, for which bids were opened last week. Griffin, Ga., has asked for bids on 1000 tons of 16 to 20-in. pipe. A project at Hollywood, Fla., requiring about 700 tons, has been postponed until July 15. A new order of the United States Pipe & Foundry Co. calls for 3670 ft. of 16-in. and 5810 ft. of 12-in. pipe for Macon, Ga. The base prices of $37 to $38 are unchanged.

Coke.—Nearly all contract buyers have renewed their contracts for third and fourth quarter requirements, and the market is again on a spot basis. Production by merchant ovens is steady at near capacity rates. Prices remain at $5, base.

Old Material.—Stove plate is being quoted at $11.50 to $12, a reduction of $1.50 from the price of the past several weeks. A reduction of 50c. a ton has been made on No. 1 cast, cast iron car wheels and scrap steel rails. Other prices are the same. New business continues at the slow rate that made the June total the lowest for any month of the year.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	$10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

Buffalo

Pig Iron Market More Active—Steel Operations Show No Falling Off—Scrap Quiet

BUFFALO, July 2.—The pig iron market shows a little more activity. A New York State melter is inquiring for 1500 tons of foundry and malleable, and a radiator manfacturer is seeking 500 to 1000 tons of foundry. A New England company is in the market for 2000 tons of foundry and there are miscellaneous inquiries for 200, 250 and 500 tons. The price in the district is firm at $19.50, base. All of the furnaces have good backlogs.

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Operations at Buffalo mills show no falling off. Prices are firm and demand is good. Lackawanna, N. Y., will buy 400 tons of structural steel for the Ridge Road bridge. A new elevator will require 400 tons of reinforcing bars. Warehouse business has been very good, particularly in sheets.

Old Material.—A small quantity of No. 1 heavy melting steel was bought at $17.25, but this seems to have been the only outstanding transaction in the past week. No. 1 cast and stove plate are both easier, one of the largest consumers here being idle at present. Consumption of other grades of scrap is holding up very well. Quite a tonnage of No. 2 steel which would ordinarily come to Buffalo has gone to Valley points because of the strong market there. Weirton is offering $16.50.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$17.00 to $17.25
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.75 to 15.00
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	7.50 to 7.75
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth	
Knuckles and couplers	19.00
Coil and leaf springs	19.00
Rolled steel wheels	19.00
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades	
Short shov. steel turnings	12.00 to 12.50
Blast Furnace Grades	
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades	
No. 1 machinery cast	16.00 to 17.00
Stove plate	12.50 to 13.00
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.00 to 19.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades	
Industrial	18.50 to 19.00
Railroad	18.50 to 19.00
Agricultural	18.50 to 19.00
Special Grades	
Chemical borings	12.50 to 13.50

Curtiss, Wright, Keystone Aviation Companies Merge

A merger of the Curtiss Aeroplane & Motor Co., the Wright Aeronautical Corporation and the Keystone Aircraft Co. has been announced. A holding company which will be known as the Curtiss-Wright Corporation, with assets of more than $70,000,000, has been formed to take over the various properties.

Richard F. Hoyt, vice-president of the banking house of Hayden, Stone & Co., New York, and chairman of the Wright Aeronautical Corporation, will be chairman of the board of the new company and C. M. Keys, head of the Curtiss Company, will be president.

Fabricated Structural Steel

Fresh Inquiries, Totaling 37,000 Tons, Largest in Past Month—Awards Aggregate 42,000 Tons

FRESH inquiries for structural steel, totaling about 37,000 tons, were the largest since early in June. Among new projects which appeared during the past week were the Cedar River pipe line at Seattle, Wash., calling for 10,000 tons of plates, and a subway section in Brooklyn requiring 9500 tons. A building for the New York Telephone Co. on West Fiftieth Street, New York, will take 4000 tons. Awards, aggregating more than 42,000 tons, were considerably less than in the previous week. The largest contract consisted of 5370 tons of plates for 15 tanks for the Texas Co. at Los Angeles, Cal. Other major transactions were 4500 tons for an office building at San Francisco, 4000 tons for a bank building at Toledo, Ohio, and 3000 tons for a bridge at Peoria, Ill. Awards follow:

BANGOR & AROOSTOOK RAILROAD, 550 tons, five bridges, to Bethlehem Steel Co.

BOSTON & MAINE RAILROAD, 200 tons, bridge at Lawrence, Mass., to Boston Bridge Works, Inc.

BOSTON, Hyde Park district, 120 tons, Edison Electric Illuminating Co. garage and store room, to unnamed fabricator.

NORTH ADAMS, MASS., 100 tons, James Hunter Machine Co. addition, to Haarmann Steel Co.

STATE OF NEW YORK, 275 tons, highway bridges at Esperance, to McClintic-Marshall Co.

STATE OF NEW YORK, 270 tons, two highway bridges, to American Bridge Co.

NEW YORK, 350 tons, garage on West Sixty-sixth Street, to Easton Structural Steel Co.

HAMILTON, N. Y., 550 tons, chemistry building and chapter house, to Utica Steam Engine & Boiler Works.

STATE COLLEGE, PA., 720 tons, main building for Pennsylvania State College, to Anthracite Bridge Co.

PHILADELPHIA, 800 tons, factory for Proctor & Schwartz, to Shoemaker Bridge Co.

PHILADELPHIA, 740 tons, building for Bank of Philadelphia & Trust Co., to American Fabricators, Inc.

BALTIMORE, 1000 tons, office building for Curtiss-Caproni Corporation, to McClintic-Marshall Co.

MONTGOMERY, ALA., 350 tons, S. H. Kress Co. store, to Ingalls Iron Works.

WINSTON COUNTY, ALA., 150 tons, highway bridges, to Virginia Bridge & Iron Co.

COLUMBIA, TENN., 120 tons, plant of Cadet Knitting Mills, to Virginia Bridge & Iron Co.

BUTLER, PA., 100 tons, bank building, to Guibert Steel Co.

LEECHBURG, PA., 100 tons, bank building, to Guibert Steel Co.

NEW KENSINGTON, PA., 1300 tons, Aluminum Co. of America, to McClintic-Marshall Co.

BUFFALO, 125 tons, National Aniline & Chemical Co., to Lackawanna Steel Co.

GUELPH, ONT., 150 tons, horticultural building for Ontario Agricultural College, to London Structural Steel Co.

LIVERPOOL, N. S., 100 tons for Mersey Power Co., to Dominion Bridge Co.

PERE MARQUETTE RAILROAD, 350 tons, two bridges in Michigan, to American Bridge Co.

FLINT, MICH., 825 tons, addition for Chevrolet Motor Co., to R. C. Mahon.

FLINT, 2400 tons, freight loading equipment for Chevrolet Motor Co. to Whitehead & Kales Co.

GRAND RAPIDS, MICH., 800 tons, school, to Russell Steel Construction Co.

TOLEDO, 4000 tons, Ohio Savings Bank & Trust Co. building, to American Bridge Co.

TOLEDO, 450 tons, Edward Ford Plate Glass Co., to McClintic-Marshall Co.

CHESAPEAKE & OHIO RAILROAD, 250 tons, bridges at Miami, Ohio, to Bethlehem Steel Co.

STATE OF INDIANA, 600 tons, building for Automobile Specialties Mfg. Co., to Indiana Bridge Co.

BALTIMORE & OHIO, 185 tons, bridge in Chicago, to McClintic-Marshall Co.

CHICAGO, 500 tons, Thompson-Starrett Building, to American Bridge Co.

CHICAGO, 500 tons, Hoops Building, to American Bridge Co.

CHICAGO, 1000 tons, garage on Plymouth Court, to unnamed bidder.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 550 tons, girder spans and track scales, to American Bridge Co.

CHICAGO, 300 tons, addition to Continental Illinois Co. building, to American Bridge Co.

PEORIA, ILL., 3000 tons, bridge, to McClintic-Marshall Co.

MILWAUKEE, 2500 tons, Milwaukee Gas Light Co. building, to Worden-Allen Co.

MILWAUKEE, 400 tons, addition to Cold Spring shops, Milwaukee Electric Railway & Light Co., to Worden-Allen Co.

SOUTH MILWAUKEE, WIS., 200 tons, locomotive shop for Bucyrus-Erie Co., to Worden-Allen Co.

TWO RIVERS, WIS., 400 tons, warehouse for Aluminum Goods Mfg. Co., to Worden-Allen Co.

UNION PACIFIC RAILROAD, 1000 tons, train shed, to Milwaukee Bridge Co.

WEYBURN, SASK., 500 tons, hospital building for Department of Public Works, Regina, to Dominion Bridge Co.

PHOENIX, ARIZ., 850 tons, Medical-Dental Building, to McClintic-Marshall Co.

LOS ANGELES, 5370 tons plates, 15 118,000-bbl. tanks for Texas Oil Co., to Western Pipe & Steel Co.

SAN BERNARDINO, CAL., 350 tons, bridge on La Cadena Street, to McClintic-Marshall Co.

HAYWARD, CAL., 400 tons plates, one 100,000 and two 200,000-cu. ft. gas holders for Pacific Gas & Electric Co., to Western Pipe & Steel Co.

SAN FRANCISCO, 4500 tons, Shell Oil Co. building, to Moore Dry Dock Co.

SACRAMENTO, CAL., 605 tons, overhead crossing at Barstow, to unnamed bidder.

WENATCHEE, WASH., 133 tons, re-decking bridge over Columbia River, to unnamed bidder.

OLYMPIA, WASH., 576 tons, viaduct in Tacoma, to unnamed bidder.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

SALEM, MASS., 300 tons, theater.

BOSTON, 200 tons, River Street bridge.

STATE OF VERMONT, 190 tons, bridges at Jamaica and Warren.

SPRINGFIELD, MASS., 175 tons, high school.

STATE OF NEW HAMPSHIRE, 100 tons, two bridges.

NEW YORK, 4000 tons, building on West Fiftieth Street for New York Telephone Co.

NEW YORK, 6000 tons, office building, Fifty-eighth Street and Fifth Avenue; bids in.

NEW YORK, 3900 tons, additional roadway on Queensborough Bridge; Bersin & Romm, New York, low bidder on second opening.

NEW YORK CENTRAL RAILROAD, 1725 tons, viaduct at 241st Street station; bids in.

PORT CHESTER, N. Y., 400 tons, building for United Hospital; bids in.

BROOKLYN, 9500 tons, subway section; Di Marco & Reimann, New York, general contractor.

STATE OF NEW JERSEY, 5450 tons, bridge over Hackensack River; Strobel Steel Construction Co., Chicago, low bidder on general contract.

STATE OF PENNSYLVANIA, 500 tons, three highway bridges; bids in.

STATE OF PENNSYLVANIA, 350 tons, highway bridge in Luzerne County; Anthracite Bridge Co., low bidder.

PHILADELPHIA, 2850 tons, Ridge Avenue section of subway; bids opened July 19.

DELAWARE, LACKAWANNA & WESTERN RAILROAD, 4000 tons, catenary supports; American Bridge Co., low bidder.

HAMILTON, ONT., 300 tons, secondary school for Board of Education.

LACKAWANNA, N. Y., 400 tons; Ridge Road bridge.

CLEVELAND, 110 tons, building for Energine Refining & Mfg. Co.

CLEVELAND, 200 tons, addition for Reliance Electric & Engineering Co.

MILWAUKEE, 2750 tons, addition to Northwestern Mutual Life office building; Holabird & Roche, Chicago, architects.

MADISON, WIS., 800 tons, bids rejected on field house for University of Wisconsin.

CHICAGO, 600 tons, Ruth automatic garage.

CHICAGO, 800 tons, Blackstone Gift Shop.

CHICAGO, 3600 tons, John R. Thompson Co. building.

BELLEVILLE, ILL., 500 tons, hotel.

SEATTLE, 10,000 tons plates, Cedar River pipe line 48-in. riveted steel; bids July 5.

SACRAMENTO, CAL., 630 tons, bridge over Salinas River; bids opened.

LOS ANGELES, 126 tons, bridge over Los Angeles River for Pacific Electric Railway Co.; bids being taken.

LOS ANGELES, 126 tons, bridge over Tujunga Wash for Pacific Electric Railway Co.; bids being taken.

Illinois Steel Co. to Expand

The United States Steel Corporation has decided to expand the capacity of the Illinois Steel Co., Chicago, in its open-hearth, plate mill and structural mill departments. Details have not yet been fully determined.

The Chicago Steel & Wire Co. has organized a subsidiary, the Fusion Welding Corporation, to sell all the welding rods manufactured by the parent company. Home offices are in Chicago and ten branches have been established. The new corporation will also handle Fuzon welding equipment and accessories.

Non-Ferrous Metal Markets

Copper Quiet But Firm, Tin Inactive, Sales of Lead and Zinc Light, Prices Unchanged

NEW YORK, July 2.

None of the markets is active because of the approaching holiday, but all quotations are firm.

Copper.—Late last week there was a spurt in demand from foreign consumers. On one day sales amounted to 3000 tons and they were fairly large on one or two other days. Since then export demand has fallen off. Domestic consumers continue to buy only what is absolutely necessary. They are well covered through July, and it is evident that they will not purchase August and future requirements until necessary. Foreign consumers are evidently overbought because they did not come into the market for the expected June consumption. As a result, the market in general continues very quiet. Quotations are decidedly firm at the levels that have prevailed for over two months. Electrolytic copper is quoted at 18c., delivered in the Connecticut Valley, with the price of Copper Exporters, Inc., at 18.30c., c.i.f. usual European ports. Present needs are still being met by custom smelters, primary producers being still out of the market. A heavy demand may develop almost any day because foreign consumers must buy considerable metal for July and August, and domestic consumers must cover for future requirements. Some feel that there is danger in this situation in that too large a demand may advance prices. Lake copper is quiet and steady at 18c. to 18.12½c., delivered.

Copper Averages.—The average price of Lake copper for June, based on daily quotations in THE IRON AGE, is 18.12½c., delivered, New York. The average price of electrolytic copper is 17.75c., refinery, or 18c., delivered in the Connecticut Valley.

Tin.—Sales of Straits tin were just under 1000 tons for the week ended Saturday, June 29. Demand is light, and there is practically none for distant futures. Spot tin, because it is plentiful, is selling at a discount, and most of the orders are for spot delivery. Partial statistics, just issued for June, show a decrease in the world's visible supply of 1016 tons. The "London group" continues its purchases and its attempts to support the market, but it has made little progress in advancing prices to 57.50c., as "a stabilized level." The market here today was decidedly in-

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass 23.25c
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.

Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

- Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
- Tubes, base ..... 42.00c.
- Machine rods ..... 34.00c.

- Lead, bar ..... 10.00c.
- Antimony, Asiatic ..... 16.00c.
- Babbitt metal, medium grade ..... 19.00c.
- Babbitt metal, high grade ..... 53.75c.
- Solder, ½ and ½ ..... 31.25c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.50c.	16.00c.
Copper, hvy. and wire	14.25c.	15.625c.
Copper, light and bottoms	12.50c.	13.50c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	11.50c.	12.75c.
No. 1 yel. brass turnings	9.25c.	10.00c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.50c.	6.00c.
Lead, tea	4.50c.	5.50c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

active, with spot Straits tin quoted at 44.62½c., New York. Prices in London today were a little higher than a week ago, with spot standard quoted at £201 15s., future standard at £205 and spot Straits at £205 10s. The Singapore market today is £208.

Lead.—Prices continue unchanged and firm at 6.80c., St. Louis, and 7c., New York, the latter being the contract quotation of the leading interest. Consumers are limiting their inquiries and purchases to cover carload lots for immediate needs. The order books of producers are comfortably filled, and there is no need to press sales.

Zinc.—Prime Western zinc, which has developed considerable firmness in recent weeks, continues steady, though demand could be considerably better. Such sales as are made are mostly at 6.70c., East St. Louis, though some factors which were at this level a week ago are asking 6.75c., and one or two others have made sales at 6.80c. The tendency continues upward. Ore prices were again unchanged last week at $44, Joplin. Output was large at about 13,000 tons, and shipments nearly equaled this at 12,856 tons, the largest since April. Surplus stocks of ore are estimated at about 37,100 tons at the end of June, compared with about 34,000 tons at the end of May and with about 20,800 tons at the end of April.

Antimony.—There has been practically no change in demand or prices, and Chinese metal is still quoted at 8.75c., New York, duty paid, for all positions.

Nickel.—Ingot nickel in wholesale lots is quoted at 35c. per lb., with shot nickel at 36c. and cathodes of electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 2.—Prices for copper are higher while quotations for antimony are lower. New buying is spotty and shipments against old orders are lighter. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 45.62½c.; lead, 6.90c.; zinc, 6.80c.; in less-than-carload lots: antimony, 9.75c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Reinforcing Steel

Awards of 5600 Tons — New Projects Smallest in Weeks

MORE than two-thirds of the total tonnage booked in the past week went into two jobs. The Cushman project at Tacoma, Wash., will require 2550 tons of reinforcing bars and an automobile storage building at New York for the New York Central Railroad will take 1400 tons. The remainder of the week's total of about 5600 tons consisted of small contracts. Fresh inquiries were the lowest in many weeks, amounting to less than 1700 tons. Awards follow:

NEW YORK, 1400 tons, automobile storage building for New York Central Railroad at West End Avenue and Sixty-fifth Street, to Jones & Laughlin Steel Corporation.

PENNSYLVANIA RAILROAD, 300 tons, warehouse in Philadelphia at Thirty-first and Chestnut Streets, to Gilmour-Roslyn Steel Co.

CEMENTON, PA., 225 tons, building for Whitehall Cement Mfg. Co., to Jones & Laughlin Steel Corporation.

EVANSTON, ILL., 285 tons, Illinois Bell Telephone Co. building, to Concrete Steel Co.

CHICAGO, 110 tons, apartment building at 1242 Lake Shore Drive, to Joseph T. Ryerson & Sons.

CHICAGO, 400 tons, Goldblatt store, to Kalman Steel Co.

DES MOINES, IOWA, 300 tons, Hubbel Hotel, to Laclede Steel Co.

TACOMA, WASH., 2550 tons, Cushman project, unit No. 2, to unnamed bidder.

SACRAMENTO, 156 tons, paving in San Diego County, to unnamed bidder.

GLENDALE, 140 tons, apartment building, 132 South Orange Street, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

NEW YORK, 200 tons, building at Mitchell Flying Field.

BUFFALO, 400 tons; cooperative elevator.

CLEVELAND, 200 tons, parcel post station.

WARREN, OHIO, 150 tons, highway bridge.

ST. LOUIS, 500 tons, boys' preparatory school for Kenrick Seminary; bids opened July 15.

SACRAMENTO, 208 tons, paving in Alameda County; bids July 17.

Railroad Equipment

Pennsylvania Expected to Buy 4000 More Car Bodies

THE railroad equipment market has been quiet the past week, and few sales and inquiries were made. The Buffalo & Susquehanna has ordered 200 50-ton steel hopper cars, while the Northern Pacific has purchased 100 flat cars. The Pennsylvania, which contracted for the construction of 4000 steel box car bodies a week ago, is expected to buy an additional 4000 soon. Details of the week's business follow:

Buffalo & Susquehanna has ordered 200 50-ton steel hopper cars from Pressed Steel Car Co.

Pennsylvania Railroad, which ordered 4000 steel box car bodies, as reported a week ago, is expected to order an additional 4000 soon.

Carnegie Steel Co. has ordered 22 gondola car bodies from Greenville Steel Car Co.

General Chemical Co. is inquiring for 46 tank cars.

Northern Pacific has ordered 100 flat cars from Pressed Steel Car Co., in addition to 200 recently reported.

Ford Motor Co. will buy six eight-wheel switching locomotives.

Timken Roller Bearing Co. has ordered an experimental locomotive from American Locomotive Co.

Obituary

WILLIAM M. JEFFERYS, director and superintendent of the Hanging Rock Iron Co., and also superintendent of the Union Iron Furnace, Ironton, Ohio, died at his home in Hanging Rock, Ohio, June 17. He had been connected with the Hanging Rock Iron Co. since 1901, when he joined the company as manager and superintendent of the Hamilton furnace. In April, 1928, he purchased the property of the company.

—

CHARLES H. DOELGER, one of the founders and senior member of Doelger & Kirsten, Milwaukee, manufacturers of alligator shears, died June 25 following an illness of six months. He was born in Milwaukee in 1865, and in partnership with Oscar F. Kirsten, established a machine shop in 1889, which for thirty years has been devoted exclusively to the production of all-steel shearing equipment. The company will continue with no changes in personnel.

—

IRVING J. BUDLONG, formerly head of the American Woodworking Machinery Co., died June 17 at his home in Saginaw, Mich., aged 60 years. Mr. Budlong at the time of his death was vice-president of the Merchon Mfg. Co., Saginaw.

—

MORRIS L. FOX, president, Pioneer Iron & Metal Co., and a resident of Racine, Wis., for thirty years, died June 27, aged 65 years.

—

EDWARD J. CARNES, president, E. J. Carnes Co., Medford, Mass., steel erector died suddenly at his home on June 30. Prior to the formation of the E. J. Carnes Co., he was for many years in charge of erecting for the New England Structural Co.

100,000 Tons of Steel Pipe Awarded

The A. O. Smith Corporation and National Tube Co. each have been awarded 50,000 tons of steel pipe for the Birmingham-Atlanta gas line.

Foundations for a battery of 70 new coke ovens have been completed at the Indiana Harbor, Ind., plant of the Inland Steel Co., Chicago.

PERSONAL

F. A. MERRICK, formerly vice-president and general manager, has been elected president of the Westinghouse Electric & Mfg. Co., East Pittsburgh, succeeding E. M. HERR, who has been made vice-chairman of the

F. A. MERRICK

E. M. HERR

board of directors. He is a graduate of Lehigh University, Bethlehem, Pa., and soon afterward became associated with the Steel Motors Co., a subsidiary of the Lorain Steel Co., as manager and chief engineer. When the Steel Motors Co. was acquired by the Westinghouse company, he was made superintendent of the Canadian Westinghouse Co. Ltd., and assisted in its organization. He later became vice-president and general manager of the Canadian company. During the World War Mr. Merrick was assigned to organize the operations of the New England Westinghouse Co. After the war he was located in London for two years as special representative of the Westinghouse Electric International Co., and then returned to Canada to resume his duties as vice-president and general manager of the Canadian company. He has been a director of the company since 1925, at which time he was elected vice-president and general manager. Under Mr. Merrick's direction, the various Westinghouse plants were reorganized as separate units for greater efficiency.

—

ROBERT E. BELKNAP has resigned as New England manager of the Bethlehem Steel Co. He was appointed to that position in 1922, following the acquisition of the Lackawanna Steel Co. and the Midvale Steel Co. by the Bethlehem Steel Co. He started in the steel business with the Pennsylvania Steel Co., first at New York and subsequently at Chicago. Mr. Belknap has been in poor health for some time and he plans to take a long rest before engaging in business again. He is succeeded as manager by ROBERT B. WALLACE. Mr. Wallace was manager of the company's New England business prior to Mr. Belknap, and is one of the most widely known steel men in New England. He has been connected with the Bethlehem Steel Co. for 19 years, for seven years as salesman and from 1917 until 1922 as sales agent. In recent years he served as sales manager of structural steel and plates. THOMAS DRANSFIELD, sales engineer for the past two years in the Boston office, succeeds Mr. Wallace as manager of structural steel and plate sales.

—

E. F. MYERS has been elected president of the Ironton Fire Brick Co., Ironton, Ohio. Other officers are W. P. Lewis and C. E. Bales, vice-presidents, and W. D. Lewis, secretary.

—

C. A. DUNN, Detroit, has been elected to the board of directors of the Appleton Steel Tube Co. Appleton, Wis. He succeeds HUGH G. CORBETT, of Kenosha, Wis., who recently resigned.

—

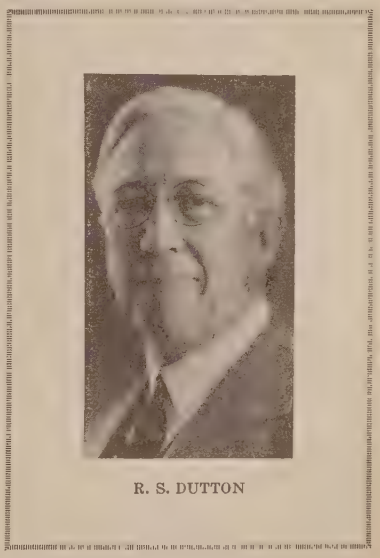
H. M. FOSTER, for the past 10 years with Wheelock-Lovejoy & Co., Cambridge, Mass., and for a number of years New York district sales manager, has been appointed general manager of sales of the Rhinegold Steel Products Co., 225 Broadway New York, agent in the United States for the Gewerkschaft Rheingold, Düsseldorf, Germany, distributer of special steels made by Stahlwerk Becker A. G., Willich, near Krefeld.

—

SAMUEL C. REBMAN has resigned his position as New York representative of the Sweets' Steel Co., Williamsport, Pa., to become as of July 1 manager of sales of tubing and allied products for the Danville Structural Steel Co., of Danville, Pa. Mr. Rebman was for many years with the Danville Structural Tubing Co., but severed that connection in 1926. In 1928 the business was reorganized as the Danville Structural Steel Co., and an extensive program of building and expansion was begun.

—

R. S. DUTTON, who for 35 years has been with the firm of Pickands, Brown & Co., Chicago, retired July 1. He will continue to make his home in Chicago but plans to occupy much of his time in traveling. Mr. Dutton went to Chicago in 1890 and accepted a position with the Illinois Steel Co. at the old Union works, which has been dismantled. At that time Robert Forsythe was general manager. In 1891 he was transferred to the cost department at South Works. One year later he entered the office of H. A. Gray, comptroller for the Illinois Steel Co. He accepted the position of bookkeeper for Pick-



R. S. DUTTON

ands, Brown & Co. in 1895. Later he became cashier for the company, and in 1911 he was made manager of sales, the position he occupied at the time of his retirement. In the intervening 35 years he watched the office force grow from six to more than 75. Mr. Dutton is succeeded by SNELLING S. ROBINSON, who has been assistant manager of sales since October, 1928. Mr. Robinson went to Chicago from the Erie, Pa., office of Pickands, Mather & Co.

—

JOHN V. W. REYNDERS, New York, sailed June 27 on the Olympic for a brief business trip to England and the Continent, and expects to return shortly after Aug. 1.

—

W. EARLE PASHLEY has been elected second vice-president and a director of the C. F. Pease Co., Chicago, manufacturer of blue-printing machinery.

—

W. C. SUTHERLAND, who has been general superintendent, Pittsburgh

Steel Co., Pittsburgh, has been appointed assistant to the president of the company, succeeding the late A. R. MAXWELL. He went with the company 12 years ago, having previously been identified with the Illinois Steel Co. at its Gary, Ind., works. After serving for a time as superintendent, Allenport, Pa., works, of the Pittsburgh company, he went with the Pittsburgh Steel Products Co. in a similar capacity, and when the manufacturing departments of the two companies were combined, he was made general superintendent. He has been succeeded in this position by D. P. KING, recently assistant superintendent. Mr. King has been with the company for 28 years, having served continuously in the operating departments.

—

O. H. ESCHHOLZ has been appointed manager of the patent department, Westinghouse Electric & Mfg. Co., East Pittsburgh, succeeding O. S. SCHAIRER, who has resigned to go with the Radio Corporation of America New York, in a similar capacity. Mr. Eschholz was graduated from the Worcester Polytechnic Institute, Worcester, Mass., in 1910, and immediately became associated with the Westinghouse company. He has been prominently identified with the electric arc-welding activities of the company, and during the war participated in the work of the welding committee of the Emergency Fleet Corporation. In 1924 he became production engineer for the Standard Gauge Steel Co., Beaver Falls, Pa., but returned to Westinghouse the following year to enter the patent department.

—

WILLIAM G. MARSHALL, since 1926 director of personnel for the Philadelphia Co. and affiliated corporations, has been appointed assistant to T. P. Gaylord, vice-president of the Westinghouse Electric & Mfg. Co., East Pittsburgh, and will be in charge of employee relations. He is a graduate of Washington and Jefferson College, Washington, Pa., and of the University of Pittsburgh law school. He has been identified with the Philadelphia Co. for the past 10 years.

—

H. W. NEWTON, who has been connected with the Stephens-Adamson Mfg. Co., Aurora, Ill., for several years as a designing engineer, has been appointed district manager of the Birmingham office of the company, succeeding W. E. HARRIS.

—

W. H. KAY has been appointed district sales manager at Kansas City for the Surface Combustion Co., Toledo. He has been associated with the company for several years, first in the erection department and then in the estimating and sales departments.

—

E. F. TALMAGE, formerly with the Halcomb Steel Co., at Cleveland, has become Chicago district sales manager of the Timken Steel & Tube Co., with headquarters at 360 North Michigan Avenue.

MAGNUS W. ALEXANDER, president, National Industrial Conference Board, New York, sailed June 29 on the Statendam for the Netherlands, to keep an engagement to address the fifth general congress of the International Chamber of Commerce at Amsterdam, on July 9, on "International Industrial Statistics as an Aid to World Progress." He is chairman of the American National Committee of the International Chamber for the development of international industrial statistics.

—

HARRY HOLIDAY, general manager of sales of the American Rolling Mill Co's. forged steel wheel division, has been appointed general superintendent of Butler works, Butler, Pa., the company's Columbia division. Mr. Holiday joined Armco in 1923 as assistant to the vice-president, in charge of construction of steel works. Later he was appointed assistant to the president, and after the Columbia Steel Co. was purchased, he was elected a vice-president of that division. He has been general manager of sales since December, 1927, with headquarters in Pittsburgh.

—

JOHN A. TOPPING, chairman, Republic Iron & Steel Co., was injured in a taxicab collision in Washington on Tuesday of last week. He was taken to a hospital, where three stitches were taken in a cut in his forehead. He is now back at his office at 17 Battery Place, New York. Mr. Topping was in Washington to testify on behalf of the American Iron and Steel Institute at a hearing on the metal tariff schedules.

—

GEORGE H. WALKER, president, W. A. Harriman & Co., and WILLIAM F. CUTLER, vice-president, American Brake Shoe & Foundry Co., have been elected directors of the National Bearing Metals Corporation.

—

ROBERT R. BRIDGMAN has been appointed manager of the Buffalo office of the O'Brien Steam Specialty Co., Syracuse. He is a graduate of Cornell University, and recently has been with the Stewart Motor Corporation of Buffalo as engineer in charge of Bendix four-wheel brakes. The company's Buffalo office is at 333 Jackson Building.

—

WILLIAM ROBBINS has been appointed district manager in charge of the Chicago office of the Chisholm-Moore Hoist Corporation, Tonawanda, N. Y.

—

J. MARVIN DOYLE, who has been engaged in the sheet and tin plate trade for the past 20 years, has severed his connection with Dickerson, Van Dusen & Co., New York.

—

C. E. POSTLEWAITE has been appointed assistant vice-president and F. O. SCHRAMM general sales manager of the Pressed Steel Car Co., effective July 1.

A. A. Stevenson Retires from Standard Steel Works Co.

ON July 1, A. A. Stevenson retired from the vice-presidency of the Standard Steel Works Co., Burnham, Pa., after 41 years of continuous service with that company. He successively occupied the position of traveling engineer, which he assumed Aug. 1, 1888; manager of wheel department in 1893; engineer in 1898; assistant superintendent in 1901; superintendent in 1903; vice-president in 1908; vice-president and engineer in 1917 and vice-president in charge of manufacture since 1920.

He entered the employ of Southwark Foundry & Machine Co., Philadelphia, as draftsman in July, 1881, remaining there until March, 1886, when he was foreman of the drafting room. He then went to Cambria Steel Co., Johnstown, Pa., as draftsman in the chief engineer's office. In July, 1887, he was made foreman of the forge and axle plant, and a year later he joined the Standard company.

A. A. STEVENSON

Mr. Stevenson has been active in various technical and engineering societies. He was the first chairman of the iron and steel committee of the American Institute of Mining Engineers, appointed in June, 1908, and was elected vice-president of the Association of American Steel Manufacturers in March, 1909, becoming president in March, 1911, holding that position for three years. He became a member of the executive committee of the American Society for Testing Materials in October, 1911, and was elected vice-president in 1914, serving two years, and in 1916 he was elected president. At the annual convention of the A. S. T. M. at French Lick, Ind., in June, 1927, Mr. Stevenson was made an honorary member of the society. Mr. Stevenson will continue to carry on many of the technical activities in which he has been engaged for several years, including that of the American Standards Association, of which he is past chairman.

Exports Running Far Above 1928

Total in Five Months Up 23 Per Cent; Rolled and Finished Steel, 25 Per Cent Higher—Imports 10 Per Cent Less in 1929

WASHINGTON, July 27.—The decline of 16,064 gross tons in iron and steel exports of the United States in May to 261,516 tons, from 277,580 in April, as noted in THE IRON AGE of June 27, was reflected in several lines, while the increase of imports to 74,272 tons from 54,337 tons, an upturn of 19,935 tons also made in a number of products, was apparently due to possible increases in tariff duties. The average daily movement of exports during the 30 days of June was 8711 tons, against an average of 8954 tons during the 31 days of May. The average daily receipts were 2476 tons in May, against 1811 tons in April.

For the five months of the current year exports showed a sharp increase over the corresponding period of last year, the respective totals being 1,344,028 tons and 1,096,595 tons. A contrary situation characterized the import movement. Incoming shipments for the first five months of the current year aggregated only 294,210 tons, against 327,486 tons for the corresponding period of 1928.

Where the Chief Sales Were Made

More than one-fifth of the export movement in June was in scrap, 55,916 tons going abroad, distributed among principal consuming countries as follows: Japan, 12,295 tons; Canada, 11,273 tons; Poland, 11,069 tons; and Italy 10,399 tons. Exports of plain structural material rose to 30,331 tons in May (20,790 tons in April), and Canada took 28,570 tons. Of the 20,185 tons of plates exported in May (18,006 tons in April) Canada took 18,291 tons. Canada also took the bulk of the 15,244 tons of skelp exported in May. This movement reflected an increase of 3867 tons over that of April.

Tin plate exports declined to 14,537 tons in May (25,991 tons in April). In May Canada took 4051 tons; Japan, 2310 tons; Mexico, 1228 tons; and Argentina, 1171 tons. Of the 13,740 tons of black steel sheets exported in May (14,615 tons in April), 9532 tons went to Canada and 1643 tons to Japan. Exports of galvanized sheets in May dropped to 11,342 tons from 14,404 tons. Of the May shipments, 2810 tons went to Canada; 1508 tons to the Philippine Islands and 1146 tons to Mexico.

Steel bar exports in May were 14,720 tons (22,032 tons in April), ship-

Exports of Iron and Steel from the United States

(In Gross Tons)

	May		Five Months Ended May	
	1929	1928	1929	1928

ments going largely to Canada, which took 9802 tons; Japan, 1677 tons; United Kingdom, 1077 tons. Of the 10,499 tons of rails exported in May, 3690 tons went to Canada and 2047 tons to Japan.

Whence the Chief Incoming Supplies

Structural shapes constituted the largest item of importation in May, amounting to 14,744 tons (12,300 tons in April), of which 5865 tons came from Belgium, 5117 tons from Germany and 3542 tons from France. Pig iron imports rose to 14,393 tons in May (6693 tons in April), coming largely from the United Kingdom, British India and the Netherlands. Of the 6907 tons of cast iron pipe imported in May, 6003 tons came from France and 716 tons from Belgium.

Belgium supplied 2397 tons; Germany, 1239 tons, and France, 944 tons of the 5039 tons of hoops, bands and cotton ties, imported in May. Imports of wrought pipe, largely seamless tubes totaled 4170 tons, of which Germany furnished 2691 tons; Canada 404 tons; United Kingdom, 351 tons; Sweden 318 tons; and France, 315 tons.

UNITED STATES IMPORTS OF IRON AND STEEL PRODUCTS

(In Gross Tons)

	May	April
Austria	60	24
Belgium	13,577	10,015

Of the 4756 tons of ferromanganese imported 3090 tons came from Canada and 1425 tons from the United Kingdom. Soviet Russia furnished 20,375 tons of the 27,767 tons of manganese ore imported while 6851 tons came from Brazil and 255 tons from India.

American Exports This Year Are Largest Since 1920

American exports in the fiscal year 1928-1929 will be the largest since 1920, amounting to close to $5,400,000 estimates the National Foreign Trade Council. This means that at the dollar value of 1913 the United States is shipping more than 40 per cent more goods abroad than before the war. The export balance will be nearly a billion dollars, or about one-third larger than for the average of the past five years. Many of the reasons for this rapid growth of American foreign trade are explained in "American Foreign Trade in 1929," the annual handbook of the National Foreign Trade Council which has just been published. The handbook contains a record of the sixteenth national foreign trade convention at Baltimore this spring.

Japanese Steel Output Increasing

WASHINGTON, June 28.—Pig iron production in Japan during January and February totaled 259,904 metric tons, compared with 236,174 tons in the corresponding period of last year, while steel ingot output increased to 350,177 tons from 282,591 tons, according to a report received by the Department of Commerce from Tokio.

Production of rolled steel products increased to 290,994 tons from 252,413 tons, as follows: Sheets less than 0.7 mm. thick, 25,890 tons, compared with 15,072 tons in the first two months of 1928; bars, 103,677 tons, compared with 79,100 tons; shapes, 40,232 tons, compared with 36,736 tons; rails, 46,365 tons, compared with 41,603 tons; wire rods, 10,130 tons, compared with 9880 tons; pipe, 10,002 tons, compared with 9441 tons; and miscellaneous products, 6079 tons, compared with 5968 tons. Plate output, alone, registered a decline from 54,613 tons in the first two months of 1928 to 48,619 tons in January and February of this year.

New Record in Industrial Electric Consumption

Activity in manufacturing plants as measured by their consumption of electric energy is reported by *Electrical World* to have made a new high record in May. The index was 136.9, on the basis of 100 as the average for 1923-1925. The increase over April, which showed 136.4, was only fractional. Compared with May of last year, however, in which the index was 119, there was a substantial gain.

At the head of the list stands the automobile industry, including parts. This showed 161.8 in May, compared with 170.6 in April and with 141.6 a year ago. Rubber and its products, mainly tires, was in second position, with 157.6 in May, a slight increase over April. The metal industries group, in third position, was 154.8 in May, compared with 149.9 in April, and with 123.6 a year ago.

Metal industries were broken into two parts. Rolling mills and steel plants showed a new high record at 172.2, compared with 153.3 in April and only 125 a year ago. Other metal-working plants, both ferrous and non-ferrous, were 144.2, a slight recession from the 148.3 of April, but well above the 122.7 of May, 1928.

CARNEGIE LIBRARY OF ATLANTA

Improvement in European Steel Continues

England and Continent Share in Better Demand—Mergers and Associations Hold Interest—Export Restriction Irks Germany

(By Cable)

LONDON, ENGLAND, July 1.

THE shortage of Cleveland pig iron continues, but more local mines and additional coke ovens are resuming operations. By autumn it is expected that fully 50 Northeast Coast furnaces will be operating. Meanwhile makers are declining to sell for the last quarter.

Hematite iron prices are firm and output is to be increased this month by blowing in the Linthorpe-Dinsdale furnace. Costs of production are increasing and, with good export sales, prices are expected to go higher.

Continental material is quiet here, as consumers are generally disinterested. Continental mills are seeking orders for semi-finished material and merchant bars, but are still firm on plates and shapes.

Tin plate is quiet but some good inquiries are in the market for domestic and export shipment. Most mills are well situated, but prompt tin plate is inclined toward easiness, as certain mills have vacant spaces in their schedules.

Galvanized sheets are dull, but prices are being maintained. Japanese demand for black sheets is quiet.

Steel Industries of Great Britain, Ltd., with a capital stock of £11,000,000 ($53,350,000) is now registered to acquire the United Steel Co.'s and the United Strip & Bar Mills, Ltd., to enter into an agreement with the Austin Friars Trust and to carry on the business of steel and iron manufacture. Negotiations for acquiring other interests are reported well advanced, but no details are available.

Belgian production in May was 348,000 tons of pig iron, 330,000 tons of raw steel and 299,000 tons of rolled products. On May 31, there were 56 furnaces in blast.

The German raw steel output in May established a new post-war record, with 1,421,000 tons. The Luxemburg output in May was 248,000 tons of pig iron. and 230,000 tons of raw steel. The Saar output in May was 186,000 tons of pig iron, 187,000 tons of raw steel and 138,000 tons of rolled steel.

British Pig Iron Makers Well Sold Ahead

LONDON, ENGLAND, June 21.—Interest continues to be centered in the pig iron market, where a strong condition prevails. The virtual withdrawal of Continental competition has placed British furnaces in a much stronger position in the domestic market. Moreover, foreign demand for British pig iron has increased. The high and uncertain cost of production, however, prevents producers from materially increasing their output. Furnaces in blast at the end of May totaled 159, the largest number for any month since October, 1927, and by the end of June there will have been a further increase.

Scarcity of pig iron is most acute in the Cleveland district, where furnaces are already sold out until October and are not inclined to consider contracts for the last quarter. Consumers in that area who need immediate supplies of iron are buying from other districts, as the tonnages in the hands of merchants are unimportant and high in price. A similar situation prevails in the hematite iron market, except that July deliveries of East Coast mixed numbers are still obtainable in small tonnages.

More of the semi-finished material being consumed now is from British producers, who are operating at a good rate. In certain inland districts British semi-finished steel sells at less than Continental, but on the coast and in Wales, Continental material is still rather widely used. Recently demand for foreign semi-finished steel has declined, particularly among sheet bar users, but this has been caused by slackening business in sheets, which has forced certain mills to curtail operations.

Finished steel business in general is good. Shape and small bar mills are heavily booked, but the capacity

of plate mills is still too large and there is keen competition for plate tonnage, with makers seeking uninterrupted operation.

Germany Seeks Cancellation of Export Restriction

HAMBURG, GERMANY, June 17.—At the next meeting of the International Steel Cartel, at Vienna, it is understood that German steel producers will ask that all export restrictions on the German steel quota be abandoned. Germany has an export allotment of 330,000 metric tons a month, which was fixed when the German mills complained of the high total of fines paid for overproduction, when most of the excess was to supply a heavy domestic demand in Germany. At that time the German penalty for excess output was reduced from $4 to $2 a ton, with the understanding that the excess was for domestic consumption and that exports would be limited. None of the other members operates under an export restriction.

German mills estimate that, because of reduced consumption of steel in Germany, it will be necessary to export 475,000 to 500,000 tons a month in the next few years—42 to 45 per cent of the total output of the country instead of, as at present, about 33 per cent. It is expected that the German delegates will make continued adherence to the cartel conditional on a cancellation of the export restriction.

To Cut German Scrap Exports

HAMBURG, GERMANY, June 17.—The Verein Eisen und Stahl Industrieller, representing steel scrap consumers, has been informed by the Government that the export embargo on heavy melting steel and machinery cast scrap will be tightened in the future. Special export licenses will only be granted when there is an abundant supply of scrap in the German market. Meanwhile scrap has been advancing from its usual level, which is 20 per cent lower than the market abroad.

British Furnaces Renew Price Control

LONDON, ENGLAND, June 21.—The blast furnaces of the Midlands are so well satisfied with their experiment in cooperative marketing and price control that they have renewed their agreement for another 12 months. Only one producer remained outside the pool. Some Midland furnaces believe that they could sell more pig iron than they are now producing, but are not prepared to risk blowing in more stacks, partly because of the uncertain coke supply. Increased supplies of coke will be required for furnaces being blown in other districts, and Midland smelters do not desire to accentuate the competition for fuel during the present shortage.

New German Association Formed

Manufacturing Consumers of Steel Combine to Protect Interests—May Not Renew Producers' Syndicates

BERLIN, GERMANY, June 15.—Manufacturers of finished products other than machinery, made from iron, steel and non-ferrous metals, have formed the Centralverband der Eisen, Metal und Blechverarbeitenden Industrie to protect their interests. Members of the new association employ more than 500,000 and include all hardware makers and most of the producers of finished metal products. The administration of the association is in the hands of Commercial Councilor Neitzert of Fulda, Herr Hager of Remscheid and Commercial Councilor Schwarz of the Bing Werke in Nuremberg.

Prospects for the renewal of domestic steel syndicates have not improved. The director of the Mannesmann Tube Co. has stated that, if the Friedrich Krupp A. G. persists in its plan to erect a tube mill with an annual capacity of 150,000 tons, the entire German syndicate system will fail. There are two groups among the steel companies—one, of which the Vereinigte Stahlwerke A. G. is representative, advocates renewal of all syndicates or none; the other, represented by the Friedrich Krupp A. G., sees no advantage in the renewal of any of the syndicates. Both groups agree that unless the syndicates are renewed Germany cannot remain in the International Steel Cartel.

Continuance of the International Steel Cartel, which expires next fall, depends on the action taken on the German domestic syndicates. Probably the International cartel will be renewed temporarily for six months or a year. If so, it is certain that Germany will demand an increase in its quota. According to German estimates, the French quota is 90.3 per cent of the largest French monthly production, the Luxemburg quota is 87.3 per cent, and the Belgian quota 82.9 per cent, while Germany's quota is only 71.2 per cent of its highest monthly output. It is also claimed that Germany's capacity has increased more than that of other members since formation of the cartel.

German Plant to Make Steel From Sponge Iron

HAMBURG, GERMANY, June 17.—A steel plant being erected at Bochum by the Vereinigte Stahlwerk A. G., Düsseldorf, and the Friedrich Krupp A. G., Essen, for the production of special steel under the Norsk Staal patents is to have a capacity of 42,000 to 45,000 metric tons a year instead of about 20,000 tons as originally announced. Sponge iron is to be used as a raw material. The plant will be completed earlier than had been planned and will probably be in operation some time in October.

Since its formation, the German Dye Stuff Corporation has secured a part interest in the company formed to build the plant, and is represented on the board of directors. The German Dye Stuff Corporation is a producer of non-ferrous metals, controlling the entire output of "electron" (magnesium) metal, but has heretofore had no financial interest in the steel industry. The holding company for the Norsk Staal patents, which will dispose of licenses in other countries, has increased its capital stock to 4,000,000 m. ($956,000), all of which is held by the Vereinigte Stahlwerk A. G., Friedrich Krupp A. G., and the German Dye Stuff Corporation.

The annual report of Schubert & Salzer, Chemnitz, largest builders of stocking knitting machinery in Germany, shows that their exports to the United States have trebled. Unfilled orders from the United States total about $3,500,000.

Increase in German Export Bounties Urged

BERLIN, GERMANY, June 15.—As part of the negotiations for the renewal of the domestic syndicates, which expire this year or in 1930, a modification of the agreement under which the Ingot Steel Syndicate grants price rebates to steel consumers manufacturing products for export is being considered.

The manufacturers' association, "Avi," is expected to demand an increase in rebates equal to the full difference between German and lower world market prices. Under the present plan, rebates do not quite represent the full difference in prices. The manufacturers also demand that the rebates shall be paid in cash, instead of being booked to their credit and applied on subsequent orders.

Three Leading Italian Plants May Merge

MILAN, ITALY, June 15.—The three leading Italian steel works—Societa Anonima Ilva, with plants at San Giovanni, Torre Annunziata, Balzaneto, Bagnoli and Sestri Ponente; the Societa Anonima Terni at Terni, and the Societa Ferriere de Voltri, with plants at Voltri and Oneglia—have entered into negotiations for a merger, under the suggested name of United Italian Steel Works. Should this combination be made, the new corporation would control about two-thirds of the total steel production of Italy.

German Foreign Trade Improving

Mills Dependent on Exports to Maintain Operating Rates —Small Producers Suffer from Lack of Capital

BERLIN, GERMANY, June 15.—Business has begun to show improvement, with an increasing demand from both domestic and export consumers and a continued decline in unemployment. A rapid revival of industry, however, is prevented by a shortage of capital, as it is almost impossible to market bonds either in Germany or abroad. In the iron and steel industry the small companies are seriously affected. In some instances manufacturers of small hardware have been compelled to refuse large orders because of inadequate finances. A renewed influx of foreign capital is not expected until the new Young plan is in force.

The credit stringency is checking building activity and demand for structual steel is smaller than a year ago. Steel bars and sheets are inactive, and orders from shipyards have declined. With the steel industry increasingly dependent upon foreign trade to maintain operating rates, there has been steady improvement in exports, especially of semifinished material to other European countries and of pig iron to consumers not receiving sufficient tonnage from British furnaces, which are heavily booked with orders. Foreign trade in wire rods and wire products has been good, April shipments totaling 85,772 tons compared with 52,180 tons in March, and exports of wire products to the United States show a rising tendency. Exports of iron and steel in four months through April were 1,726,622 metric tons, against imports of 567,734 tons.

Exports of cutlery, principally from Solingen, are rapidly increasing, but average prices are lower because the larger portion of sales are to Asiatic markets. Exports of cutlery in April totaled 738 metric tons, compared with 586 tons in March. Sales to India and the Dutch East Indies have increased, and business with Argentina has doubled.

German Motor Car Builders May Erect American Plants

HAMBURG, GERMANY, June 17.—Manufacturers of high-priced automobiles here are giving increased attention to the United States as a market for their products, and it is believed that one and possibly two German motor car builders may establish assembly plants in America.

The Mercedes-Benz company, which has been long interested in the United States market, is mentioned among the possible builders of American assembly plants. This company is now selling Diesel engine trucks and 120 180-hp. compressor-type passenger automobiles in the United States.

Japanese Black Sheet Prices Decline

NEW YORK, July 1.—Exporters in close contact with the market in Japan report dealers there overstocked with light-gage black sheets, continued high operating rates of the Japanese sheet mills and declining business with China in galvanized sheets. These conditions have depressed prices of black sheets in the Japanese market, and recent quotations of the Kawasaki Dockyard Co., Kobe, have been 187 yen ($82.28) per ton, delivered to Tokio warehouses. Deducting from this delivered price the duty of 33.06 yen ($14.55) per ton and the freight rate from Yokohama to Tokio of 2 yen (88c.) per ton, imported light-gage sheets would have to be sold at 151.94 yen ($66.85) per ton, c.i.f.

The Government steel works is quoting even lower prices, asking 180.83 yen ($79.57) per ton, or, deducting the duty and freight rate from Yokohama to Tokio warehouses, the equivalent of 145.77 yen ($64.14) per ton c.i.f. Exporters are not seeking new sheet business in Japan, with the domestic price too low for British or American competition.

Increase in Imports of Pig Iron in May

WASHINGTON, June 27.—Imports of pig iron in May advanced to 14,393 gross tons, or almost as much as the April and March tonnages combined—6693 tons and 8572 tons. The May total, however, was lower than the 16,299 tons in February. It was about 50 per cent above the 9732 tons of May, 1928.

For the five months, imports at 62,065 tons have been slightly less than the 63,496 tons of last year. There has not been much change in the line-up of countries of origin, although tonnage from Great Britain has fallen off nearly 20 per cent in favor of additions to the amounts received from British India, Netherlands, Norway, etc.

United Kingdom, British India and Netherlands, in that order of magnitude, furnished nearly 95 per cent of the May total and more than 95 per cent of the total for the month a year ago.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT
(In Gross Tons)

	May		Five Months Ended May	
	1929	1928	1929	1928

Steel Industry in Germany Well Occupied

(*By Radio*)

BERLIN, GERMANY, July 1.—All of the Steel Syndicate's domestic prices for July remain unchanged from June. The price of unsyndicated thin sheets has been advanced by 5 m. ($1.19) since the beginning of June.

Production of pig iron and steel is being well maintained and orders are coming in satisfactorily. The domestic market for structural steel is improved and export outlets are active, at advancing prices.

As a result of the Railroad Corporation's orders, the market for steel rails is more active. But bars are weakening in both domestic and export markets.

Machinery manufacturers report a continuation of the rapid increase in export orders. General improvement in the European market is expected by Rhenish-Westphalian experts.

German Non-Ferrous Cartel

BERLIN, GERMANY, June 16.—All the German non-ferrous metal associations have agreed to establish a central organization, with headquarters here, which will combine all existing associations and syndicates, including the producers of aluminum and the manufacturers of aluminum products. No name for the new association has yet been selected.

Industrial Engineering & Equipment Co., 1341 Syndicate Trust Building, St. Louis, has been appointed sales representative in southern Illinois and south central Missouri by the Despatch Oven Co., Minneapolis, Minn., manufacturer of industrial ovens, which include core and mold ovens, special drying ovens and conveyor ovens for high-speed production.

Machinery Exports Continue Large

May Total Greater Than for Any Month Between January, 1921, and January, 1929—Imports Much Heavier

WASHINGTON, June 27.—Exports of machinery of all kinds from the United States in May declined to $48,085,615 from $51,371,056 in April, making a drop for the second successive month. Imports of machinery and vehicles, on the other hand, continued to rise, apparently by reason of pending tariff legislation, and totaled $4,059,694, against $3,949,218. Imports listed in THE IRON AGE table totaled $3,191,787 in May and $3,015,094 in April. Exports in May of this year showed a substantial increase over those for the corresponding month of last year, with a total of $44,687,939.

Taking the first five months of the year, sharp increases were made in both exports and imports, the former rising to $255,357,842 from $186,666,589 for last year. Imports of machinery and vehicles aggregated $18,143,355 and $11,401,935 respectively. Imports of machinery listed in THE IRON AGE table were valued at $14,223,769 for the first five months, against $8,706,883 last year, while imports for May of last year, at $2,029,893, were far below the current figure.

Exports of industrial machinery in May were $22,158,220, according to the classification of the Division of Statistics, Department of Commerce, against $23,516,044 in April and $20,103,213 in May of last year. For the first five months of 1929 and 1928 respectively they were $116,061,209 and $88,479,157. Imports of industrial, office and printing machinery in May were $2,213,314, compared with $2,103,589 in April and $1,457,391 in May, 1928. For the first five months they were $10,374,581 in 1929, against $6,684,804 last year.

Power-driven metal-working machinery to the value of $2,354,826 was exported in May, compared with $2,804,788 in April and $1,966,866 in May of last year. For the five months of 1929 and 1928 the values were $14,045,444 and $9,787,716 respectively. Outgoing shipments of hand-driven metal-working machinery in May were $7,997,162, against $8,165,535 in April and $7,208,990 in May of last year. Exports for the first five months were valued at $40,784,846, against $32,083.946 for the corresponding period of last year.

Hours and Earnings in Metal-Working Plants

Studies of the Bureau of Labor Statistics of the United States Department of Labor show that the hourly earnings in the motor-vehicle industry in 1928 averaged 75c., compared with 72.3c. in 1925 and with 65.7c. in 1922. Owing to a slight reduction in the average length of the working week, which dropped from 50.3 hr. in 1925 to 49.4 hr. in 1928, the weekly earnings did not show so substantial an increase as did those measured by the hour. Average full-time weekly earnings were $32.92 in 1922, $36.37 in 1925 and $37.05 in 1928.

Entrance wage rates for common labor, as of last January, averaged 55.9c. an hour for the automobile industry. This average was the highest reported for any industry. The lowest was 30.8c., in saw mills, and the average for all industries about 45c. These figures are based on reports from plants employing nearly 140,000 common laborers.

Machinery Exports from the United States

(By Value, in Thousands of Dollars)

Machinery Markets and News of the Works

June Sales Satisfactory

Large Number of Unexpected Orders Is Feature of Machine Tool Buying—Heavy Production Continues

JUNE was a satisfactory month for the machine tool industry, though sales fell somewhat below those in May.

A feature of current buying is the number of unexpected orders placed by companies which are rushed with demands for their own products. Moreover, many of the purchases have been made by users who for months have shown little or no interest in new equipment.

Bookings have been in large enough volume to keep machine tool plants busy well into the fall. A leading lathe manufacturer expects to maintain production 50 per cent above normal until September, and this condition is not unusual with other companies.

Transactions in the past week included equipment for the General Electric Co., an airplane maker and a printing press company. Four railroads have bought heavy-duty equipment from a Cincinnati lathe builder, while the New York Central and the Burlington each have purchased small lots of tools. The Rock Island and the Chicago & North Western are in the market for a few machines. Railroad buying this year, however, has been disappointing.

The United States Air Corps, Wright Field, Dayton, Ohio, has taken bids on seven geared-head, motor-driven lathes. The Cleveland Union Terminals Co. has not yet bought 25 tools for which it recently inquired.

At Chicago, a farm implement manufacturer is reported ready to place orders for a large number of tools.

Indications are that demand for machine tools will continue steady.

New York

NEW YORK, July 2.—Buying of machine tools in good volume has continued the past week. Orders were received from the New York Central Railroad, the General Electric Co. and several others. An airplane company also bought a number of tools. Another buyer was a manufacturer of printing presses. A feature of current buying is the number of orders which are unexpected, the decision to purchase being quickly made by companies which are rushed with orders for their own products. Local sellers consider the outlook promising for steady demand during the midsummer months.

Contract has been let by Metropolitan Engineering Co., 1250 Atlantic Avenue, Brooklyn, manufacturer of protective devices and equipment, to T. E. Murray, 88 Lexington Avenue, New York, for extensions and improvements in two-story plant, to cost about $45,000 with equipment. E. W. Helms, New York address noted, is architect.

Ward-LaFrance Motor Truck Corporation, 276 Jackson Avenue, New York, has leased a building at Long Island City for a new service and repair plant.

Art Steel Co., 401 East Twenty-third Street, New York, manufacturer of steel boxes and containers, etc., is said to be planning a new local plant to cost over $150,000 with equipment. Present works will be removed to new location.

Officials of Electric Boat Co., 11 Pine Street, New York, manufacturer of motor boats, submarines, etc., with plants at Groton, Conn., and Bayonne, N. J., have organized Alto-Elco Aircraft Co., a subsidiary, to manufacture aircraft and parts. It is proposed to establish parts and assembling departments at one of present plants.

M. J. Ort, 424 East 149th Street, New York, architect, has plans for a six-story automobile service, repair and garage building, to cost about $125,000 with equipment.

Transport Aircraft Corporation has been organized to take over and succeed to Kaess Mfg. Corporation, Lindenhurst, L. I., manufacturer of airplanes and parts. New organization plans for sale of 40,000 shares of stock, no par value, part of proceeds to be used for expansion.

Shell Union Oil Corporation, 65 Broadway, New York, operating oil refineries, storage and distributing plants, pipe lines, etc., in California, Mid-Continent field, Texas and other points, is disposing of a preferred stock issue of $40,000,000, part of proceeds to be used for expansion. Company has arranged for purchase of New Orleans Refining Co., New Orleans, and will consolidate. Shell Eastern Petroleum Products, Inc., a subsidiary, has begun construction of new oil storage and distributing plant in Raritan Bay district, near Woodbridge, N. J., to cost more than $125,000 with equipment.

Schaefer & Rutkins, 2408 Grand Concourse, New York, architects, have plans for a six-story automobile service, repair and garage building, to cost about $300,000 with equipment.

New York Steam Corporation, 280 Madison Avenue, New York, has plans for an addition to power plant on Water Street, including improvements in present station, to cost more than $225,000 with equipment.

Segal Lock & Hardware Co., 155 Leonard Street, New York, with main plant at 55 Ferris Street, Brooklyn, is arranging an expansion program, including acquisition of property in Middle West, for a branch plant. Company has authorized an increase in capital stock, part of proceeds to be used for expansion noted.

Board of Education, Peekskill, N. Y., plans installation of manual training equipment in three-story high school, to cost $750,000, for which bids had been asked on general contract. Wilson Potter, 22 East Seventeenth Street, New York, is architect.

Perth Amboy Tile Works, Sayre Avenue, Perth Amboy, N. J., manufacturer of floor and wall tile, plans rebuilding part of plant recently destroyed by fire with loss estimated at over $300,000 including equipment. Company is a division of Beaver Falls Art Tile Co., Beaver Falls, Pa.

United States Aluminum Co., Garwood, N. J., has awarded general contract to Wigton Abbott Co., 705 Park Avenue, New York, for one-story addition, 60 x 120 ft., including improvements in present plant, to cost $45,000 with equipment. Company is affiliated with Aluminum Co. of America, Inc., Oliver Building, Pittsburgh.

Gold Seal Mfg. Co., Inc., 127 South Fifteenth Street, Newark, manufacturer of radio tubes and equipment, has acquired Rosasco Mfg. Co., 267 Wyckoff Street, Brooklyn, manufacturer of kindred apparatus, and will consolidate. Purchased plant will be continued in operation and a capacity output arranged, totaling close to 10,000 tube units and other equipment daily.

Jersey Central Power & Light Co., 20 South Street, Asbury Park, N. J., will soon begin construction of steam-operated electric generating plant at South Amboy, N. Y., with main unit, one story, 160 x 160 ft., to cost about $5,000,000 with transmission system. Electric Management & Engineering Corporation, 57 William Street, New York, is engineer, and will supervise erection.

Watson Flagg Engineering Co., 120 Liberty Street, New York, manufacturer of mechanical equipment, has awarded general contract to John W. Ferguson Co., Paterson, N. J., for one-story machine shop to plant at 843-7 East Twen-

ty-fifth Street, Paterson, 75 x 122 ft., to cost $35,000.

Herpers Brothers, 18 Crawford Street, Newark, jewelry manufacturers, will soon begin construction of two-story and basement addition, 26 x 62 ft., to cost about $30,000 with equipment. Edward A. Wurth, Jr., 207 Market Street, is architect.

East New York Iron & Wire Works, structural steel fabricator, formerly at 825 Sackman Street, Brooklyn, has moved to 47-71 East 100th Street, Brooklyn.

Luna Metal Craft Corporation, sheet metal specialties, stampings, etc., formerly located on West Twenty-first Street, New York, has moved to 38-40 Emerson Place, Brooklyn. H. A. Nodler is president.

Rheinegold Steel Products Co., 225 Broadway, New York, has been incorporated as agent in United States for Gewerkschaft Rheingold, Dusseldorf, Germany, export distributer of carbon and alloy steels, high speed steel and ball bearing material made by Stahlwerk Becker A. G., Willich near Krefeld, Germany.

Meurer Steel Barrel Co. has moved its offices to its new plant at 105 Avenue L, Newark, N. J., which will have capacity of 4000 barrels daily. Company will be in position to make prompt shipments by motor truck to all sections of New York metropolitan district.

Philadelphia

PHILADELPHIA, July 1.—Bids are being asked until July 8 by W. E. S. Dyer, Land Title Building, Philadelphia, architect and engineer, for a power plant at mill of Skenandoa Rayon Corporation, Utica, N. Y., to cost over $200,000 with equipment. Company also has plans by same engineer for additions to main mill, to cost more than $2,500,000 with machinery.

Philadelphia Insulated Wire Co., 200 North Third Street, Philadelphia, has taken over adjoining building, totaling about 7500 sq. ft. floor space, for expansion.

Hess-Bright Mfg. Co., Front Street and Erie Avenue, Philadelphia, manufacturer of ball bearings, has taken bids on general contract for a two-story and basement addition, to cost over $100,000 with equipment.

Vacuum Oil Co., 61 Broadway, New York, has awarded general contract to Turner Construction Co., Graybar Building, Philadelphia, for storage and distributing plant at Philadelphia, where property was recently acquired, to cost about $200,000 with equipment. Project will include one-story service, repair and garage building for company motor trucks.

Plant addition of Proctor & Schwartz, Inc., Seventh Street and Tabor Road, Philadelphia, manufacturer of drying and air-conditioning machinery, etc., referred to in these columns last week, will cost about $250,000 with equipment, instead of smaller amount previously noted. It is understood that unit will be occupied by Proctor & Schwartz Electric Co., a recently organized subsidiary, to manufacture electrical equipment used in conjunction with machinery of parent company. Simon & Simon, Fidelity-Philadelphia Building, are architects.

Philadelphia Salt Co., Pier 36, North Wharves, Philadelphia, has plans by A. C. Wood, 1411 Walnut Street, engineer, for one-story power plant, to cost $50,000 with equipment.

Acosta Aircraft Corporation, Trenton, N. J., operating at recently established plant on Whitehead Road, formerly used by Mercer Automobile Co., will establish a department for production of metal speed motor-boats, in addition to regular airplane manufacture. Boats will average about 12 ft. long, with beam measurement of 4 ft., and V-type step bottom, designed to use any type of outboard motor. George H. Stewart is general manager.

Thermoid Rubber Co., Whitehead Road, Trenton, N. J., has taken out a permit for a one-story addition, 100 x 170 ft., primarily for manufacture of automobile brake lining, to cost about $45,000.

Sylvania Products Co., Emporium, Pa., manufacturer of radio tubes and equipment, has leased a building at Lock Haven, Pa., and will remodel for branch plant to cost about $40,000.

J. E. Horton, 146 North Eleventh Street, Reading, Pa., and associates have organized Empire Steel Castings Co., and plan operation of foundry at Frush Valley, Berks County, to manufacture iron, steel and metallic alloy castings. Wallace E. Belcher, 313 South Broad Street, Philadelphia, is interested in new organization.

Best Body Corporation, Coatesville, Pa., has been organized to manufacture dump bodies for trucks and trailers and will let contracts for fabrication of bodies. R. C. Templin is president, and A. Brezovitz, vice-president.

The Crane Market

FEW sales of electric overhead or locomotive cranes have been reported in the past week, but some substantial business is pending, especially for overhead cranes, including four lists, one for seven cranes, one for nine cranes and two for 10 cranes each. Other overhead inquiries include a 3-ton, 20-ft. radius hand power jib crane and a 3-ton chain block for the Phoenix Utility Co., 71 Broadway, New York. Locomotive crane inquiries include two 25-ton cranes still pending for the New York Central Railroad and one 25-ton crane for the Atlantic Coast Line Railroad.

Among recent purchases are:

Baltimore & Ohio Railroad, Baltimore, eight 25-ton, Diesel engine-driven locomotive cranes from Industrial-Brownhoist Corporation.

National Tube Co., McKeesport, Pa., two 10-ton, 80-ft. 2-in. span overhead electric cranes for seamless tube mill from Alliance Machine Co.

Elmira Foundry Co., Elmira, N. Y., 22-ton, 8-wheel locomotive crane from Orton Crane & Shovel Corporation.

Buffalo

BUFFALO, July 1.—Superstructure will soon begin by Garlock Packing Co., Palmyra, N. Y., manufacturer of mechanical packing products for power plants, for a one-story addition, totaling about 10,000 sq. ft. floor space, to cost about $45,000 with equipment.

Oneida Community, Ltd., Oneida, N. Y., manufacturer of plated ware, animal traps, etc., is disposing of a note issue of $2,000,000, to be used in part for purchase of controlling interest in William A. Rogers, Ltd., Niagara Falls, N. Y., and Hartford and Wallingford, Conn., manufacturer of plated wares, cutlery, etc. Last noted organization will be continued under present name and plants maintained at existing locations; expansion in output will be arranged. Pierrepont B. Noyes is president of purchasing company.

Board of Education, Little Falls, N. Y., is considering installation of manual training equipment in new two-story junior high school to cost $275,000, for which plans have been drawn by F. Haug, Little Falls, architect; A. R. Acheson, Eckel Building, Syracuse, N. Y., is mechanical engineer.

William Weinert, 1 Newfield Street, Buffalo, and associates have organized Greenite Co., to operate a local foundry for manufacture of castings. Production is planned at early date. Harold J. Tillou, 21 Charham Drive, is also interested in new company.

Fire, June 24, destroyed welding shop at plant of American Laundry Machinery Co., Rochester, N. Y. It is planned to rebuild at once.

Pittsburgh

PITTSBURGH, July 1.—June business in this district was considerably ahead of May and probably one of the best summer months experienced in the industry. Nor has there been any marked decrease in the amount of business pending. Third quarter lists of large buyers are coming out, and the bulk of prospective purchases of the Westinghouse Electric & Mfg. Co. is expected to be released very soon. Railroad buying is rather quiet. The Pennsylvania Railroad is inquiring for a radius grinder.

Purchases are being made regularly for the large steel plant extensions under way in the Pittsburgh district. The A. M. Byers Co. is closing regularly on equipment for its new plant at Ambridge, Pa., and is also making purchases for its Warren, Ohio, plant, preparatory to turning that unit into a sheet bar mill, with pipe operations concentrated at Ambridge. Steel Corporation subsidiaries are active buyers for various plants.

Contract has been let by Gulf Refining Co., Frick Annex, Pittsburgh, to John N. Gill Construction Co., Franklin Trust Building, Philadelphia, for one and two-story addition to oil refinery at Girard Point, Philadelphia, to cost $330,000 with equipment. E. B. Lee, Seventh Avenue and Smithfield Street, Pittsburgh, is architect. Company has approved plans for construction of steam-turbo power plant at its refinery, Port Arthur, Tex., to cost more than $100,000 with equipment. United Engineers & Constructors, Inc., 112 North Broad Street, Philadelphia, will prepare plans for extensions and improvements in power house, tank department, pipe lines and other divisions at branch refinery on Staten Island, N. Y., to cost over $300,000 with equipment.

Coshocton Iron Co., Monongahela, Pa., manufacturer of castings, mining equipment, etc., has plans for a one-story addition, 160 x 480 ft., to cost about $130,000 with equipment. Company is a subsidiary of Combustion Engineering Corporation, 200 Madison Avenue, New York.

Service Mfg. Co., Erie, Pa., recently formed by K. C. Eagley, 1058 West Sixth Street, and associates, is said to be planning early operation of local plant to manufacture lubricating devices and equipment.

Wayne United Gas Co., Charleston, W. Va., operating natural gas properties, pipe lines, etc., in Wayne County, W. Va., and

in Kentucky, has arranged for a bond issue of $1,500,000, part of proceeds to be used for extensions and improvements.

Acme Steel Construction Co., Inc., 401 Third Avenue, Pittsburgh, is planning to rebuild part of plant destroyed by fire June 22.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, has awarded general contract to W. S. Bellows, Herskowitz Building, Oklahoma City, Okla., for construction of a machine shop, storage and distributing building, and other units at Henryetta, Okla., where new sheet glass plant will be constructed, to cost about $2,000,000. Other building awards have been made to Rust Engineering Co., 606 Grant Street, Pittsburgh; contracts for main buildings will be let soon.

Detroit

DETROIT, July 1.—Property at Adrian, Mich., heretofore held by Adrian Improvement Co., has been purchased by Titan Electric Co., Butler, Ind., manufacturer of motors, generating apparatus and other electrical equipment. Plant will be removed from Butler to new location and additional equipment installed.

Sparta Foundry Co., Sparta, Mich., manufacturer of piston rings, etc., is arranging for expansion to cost about $100,000, including two new one-story units to provide about 20,000 sq. ft. additional floor space, and installation of equipment.

Buhl Aircraft Co., Marysville, Mich., has awarded contract to A. J. Zemmer, Port Huron, Mich., for hangar at airport near St. Clair, Mich., partly for airplane assembling, as well as for storage, to cost more than $45,000 with equipment.

Wolverine Screw Co., St. Jean Avenue, Detroit, has awarded general contract to W. J. C. Kaufmann Co., 10610 Shoemaker Street, for one-story addition, to cost over $40,000 with equipment.

Detroit Gasket Mfg. Co., 6209 Hamilton Street, Detroit, is arranging for a stock issue to total about $1,150,000, part of fund to be used for expansion and improvements.

Weatherproof Body Corporation, Corunna, Mich., manufacturer of automobile bodies, a division of Allied Motor Industries, Inc., Detroit, has purchased former plant of Field Body Corporation, Owosso, Mich., defunct, totaling about 200,000 sq. ft. floor space, and will occupy for branch plant. Equipment will be installed for production of bodies for commercial cars, truck cabs, body parts, etc. E. C. Morine is president of purchasing company.

Cadillac Aircraft Corporation, Detroit, recently organized with capital of 25,000 shares of stock, no par value, has taken over former plant and property of Stinson Aircraft Co., Northville, Mich., which recently removed its works to Wayne, Mich., and will occupy for manufacture of airplanes and parts. Initial production will be given over to amphibian units, designed to carry four persons, with parts manufacturing and assembling departments; engines will be purchased from outside sources. H. G. McCarroll is vice-president.

Simon Iron & Steel Corporation, Lansing, Mich., has awarded general contract to A. R. Foster, Lansing, for one-story storage and distributing plant, to cost over $35,000 with equipment.

Ford Motor Co., Detroit, has authorized an expansion program at aircraft manufacturing plant at Dearborn, Mich., to increase present floor space over 150 per cent. All departments will be enlarged, including parts division, which will take over work heretofore carried out at River Rouge plant. Production of one complete all-metal air transport daily is planned. Program is reported to cost over $450,000 with equipment.

Sky Specialties Corporation, 3651 Hart Avenue, Detroit, has been organized as consolidation of Simon Airplane Appliance Co. and Heywood Starter Corporation. Capitalization consists of 200,000 shares of stock of which 125,303 are outstanding. Company will manufacture self-starters and other airplane parts. Arthur L. Cash is president; F. L. Riggin, vice-president, and S. D. Den Uyl, secretary and treasurer.

Peoples Clamp Corporation, Twelfth and Sycamore Streets, Wyandotte, Mich., has been organized to take over Peoples Clamp Corporation of New York. Company will manufacture patented double-wrapped hose clamp for automobiles, airplanes, motors and all hose connections. Purchase of new machinery is contemplated.

Ex-Cell-O Tool & Mfg. Co., Detroit, has changed its name to Excello Aircraft & Tool Corporation because of large increase in its production of aviation parts. A public issue of stock will be made shortly, proceeds of which will be devoted to plant expansion. Present plant, built in 1928, has 50,000 sq. ft. of floor space. Company expects to manufacture several additional parts for airplanes and Diesel motors.

Cleveland

CLEVELAND, July 1.—Machine tool sales were good the past week. While inquiry has fallen off, dealers closed on a good volume of single tools that had been pending for some time. June, on the whole, was a very satisfactory month for the machine tool industry, although business fell somewhat below that of May. A local turret lathe manufacturer, who broke previous sales records in May, reports a decline of only 20 per cent from its May volume.

The Air Corps, War Department, Wright Field, Dayton, Ohio, received bids June 27 for three 14-in. x 6-ft. and four 16-in. x 8-ft. geared head motor-driven lathes for shipment to various points. There were five bidders, the bids ranging from about $16,000 to $20,000. Cleveland Union Terminals Co. has not yet purchased the 25 machines for which it recently inquired.

Ohio Seamless Tube Co., Shelby, Ohio, has approved plans for a 40 per cent increase in its plant capacity which will involve an expenditure of about $400,000 in buildings and equipment.

Contract has been let by Franklin Steel Co., 5426 Lake Court, Cleveland, to Boldt-Rapp Co., 5511 Euclid Avenue, for one and two-story addition to plant, to be used in part for shear department and storage and distribution, to cost about $40,000 with equipment.

Pennsylvania-Ohio Power & Light Co., 25 East Boardman Street, Youngstown, has plans for a steel tower transmission line from generating station at Toronto, Ohio, to Akron and vicinity, consisting of 580 towers, switching facilities, etc., to cost more than $500,000. Stevens & Wood, Inc., 20 Pine Street, New York, are engineers.

Lakeland Aviation Co., Inc., Union Trust Building, Cleveland, is considering new one-story plant for aircraft manufacture, to cost about $40,000 with equipment. J. E. Mathews is president.

Kasle Iron & Metal Co., 1102 Lagrange Street, Toledo, Ohio, has awarded general contract to Kopitke Construction Co., 321 Wabash Street, for one-story plant, to cost about $40,000 with equipment. Forster & Wernert, Nicholas Building, are architects.

Ohio Fibrated Asphalt & Rubber Co., Sandusky, Ohio, recently organized by H. R. Greenlee, president of former Erie Rubber Co., Sandusky, has taken over plant of latter company and will remodel for manufacture of mechanical rubber goods, including molded specialties, and fibrated asphalt products for expansion joints, etc.

Bender Body Co., 6409 Barberton Avenue, Cleveland, manufacturer of automobile bodies, has awarded general contract to A. M. Higley Co., Plymouth Building, for one-story addition, 135 x 170 ft., to cost about $140,000 with equipment.

New England

BOSTON, July 1.—Dealers report a decline in machine tool sales. Transactions included a number of lathes, two milling machines, grinders, punches and other presses. Fresh inquiry is scarcer and the outlook is not encouraging in view of the fact that metal-working plants wanting tools and unable to secure fairly prompt deliveries have stated that purchases will not be made until after the opportunity to inspect tools on exhibition at the national show in September. Business in used tools is dull.

June sales of small tools totaled larger than expected. Bookings, however, were less than in May. Deliveries on certain types of tools are still quite extended.

Dewey & Almy Chemical Co., 235 Harvey Street, Cambridge, Mass., will build a machine shop.

J. W. Greer Co., 119 Windsor Street, Cambridge, Mass., confectionery and baking machinery, has plans for a manufacturing plant at Waltham, Mass.

American Mineral Products Co., Inc., 983 Main Street., Hartford, Conn., will soon ask bids on a one-story, 36 x 200 ft. plant, at Walpole, N. H.

James Hunter Machine Co., 2 Main Street, North Adams, Mass., is erecting a one-story, 72 x 154 ft. machine shop addition. Aberthaw Co., Boston, is contractor.

J. T. Healy & Son, 196 Main Street, Attleboro, Mass., jewelry manufacturers, are erecting a one-story manufacturing plant, 26 x 96 ft. Buffing tools are under consideration.

Electric Boat Co., New London, Conn., has formed Alto-Elco Aircraft Co. to manufacture airplanes. Details of production have not yet been worked out.

Worcester Brass & Electric Plating Co., 316 Shrewsbury Street, Worcester, Mass., lost by fire all enameling ovens and accessories. Company plans to install new equipment soon.

Wireless Specialty Apparatus Co., 76 Atherton Street, Roxbury district, Boston, has plans for a one-story, shipping room and platform 25 x 100 ft. Conveying equipment is under consideration.

A. G. Spalding & Brothers, Center Street, Chicopee, Mass., sporting goods, has started work on a two-story machine shop 30 x 80 ft., and one-story forging unit, 30 x 84 ft.

Warren Telechrone Co., Ashland, Mass., has plans for an addition. Details will be given out soon.

Westfield Boys Trade School, Westfield, Mass., has plans for a three-story

trade school addition, 75 x 180 ft. C. Derby is principal.

City of Westfield, Mass., will have plans ready about July 17 for a trade school addition to cost $80,000. New mechanical equipment will be needed.

City of Hartford, Conn., will close bids next week on a one-story repair shop addition, 32 x 92 ft. Miscellaneous small tools will be required.

American Coal & Chemical Co., 55 Derby Street, Salem, Mass., has plans for a one-story, 45 x 80 ft. coal pocket. Coal handling equipment will be purchased.

City of Meriden, Conn., has plans for a three-story trade school, 60 x 250 ft.

Bids will be taken at once by Fletcher-Thompson, Inc., 542 Fairfield Avenue, Bridgeport, Conn., architect and engineer, for new steam power plant at Stamford Hall Sanitarium, 70 Summer Street, Stamford, Conn., including three 150 hp. boilers, three stokers, flue stack and auxiliary equipment.

Chemical Paper Mfg. Co., Holyoke, Mass., manufacturer of processed papers, has asked bids on general contract for two new units, two stories, 50 x 195 ft. and 35 x 75 ft., to cost about $200,000 with equipment.

Butchart-Nicholls Co., Glenbrook, Conn., manufacturer of golf clubs, irons, etc., has purchased former plant of British-American Mfg. Co., in Springdale district, Stamford, Conn., and is said to be planning early occupancy of part of property for expansion.

North Dighton Stove Co., 1 Railroad Avenue, Taunton, Mass., is rebuilding part of plant, including foundry and assembling department, recently destroyed by fire, to cost over $85,000 with equipment.

James Hunter Machine Co., North Adams, Mass., is planning one-story addition, 70 x 160 ft., primarily for an assembling and erecting shop, to cost over $50,000.

Boston & Albany Railroad Co., South Station, Boston, is planning extensions and improvements in engine house and shops at West Springfield, Mass., to cost about $500,000 with equipment.

Providence Spring Bed Mfg. Co., 355 Washington Street, Providence, R. I., has been organized to manufacture springs, metal beds, etc. Company is in market for materials.

St. Louis

ST. LOUIS, July 1.—Plans are being drawn by Air Terminal Corporation, Kansas City, Mo., care of Buckley & Van Brunt, Gloyd Building, architects, for airport near city, consisting of steel hangars, repair shops, oil storage and other units, to cost more than $500,000 with equipment.

American Eagle Aircraft Corporation, Kansas City, Mo., is planning establishment of factory branches and distributing plants at Chicago, Portland, Minneapolis, Dallas, Tex., and Atlanta, Ga., each one story, entire group to cost more than $100,000 with equipment.

Cities Service Oil Co., Tulsa, Okla., has plans for new storage and distributing plant at Perry, Okla., to cost about $50,000 with equipment. O. P. Blankenburg is construction superintendent in charge.

Gardner Motor Co., Main and Rutger Streets, St. Louis, is arranging for sale of 200,000 shares of stock, totaling about $2,500,000, a considerable part of proceeds to be used for expansion. Company has contracted with Sears, Roebuck & Co., Chicago, mail order distributers, for production of light type automobile to retail at $500, and will develop quantity output of new car within five to six months. Regular line of Gardner cars will be continued as heretofore. Part of appropriation noted will be used for development of Parks Aircraft Co., a subsidiary, operating at a recently established plant in East Side district; three types of monoplanes will be constructed, to retail from $3,500 to $12,000, and complete facilities for parts manufacture and assembling will be provided. Amos O. Payne is chief engineer of Parks organization.

City Council, Columbia, Mo., has plans for addition to municipal electric light and power plant, to cost more than $40,000 with equipment. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is engineer.

Manhattan Motor Co., Manhattan, Kan., has awarded general contract to M. J. Green, Manhattan, for two-story service, repair and garage building, 100 x 150 ft., to cost about $100,000 with equipment. A. H. Brewer, 250 East Ohio Street, Chicago, is architect.

Fairfax Airport Co., Kansas City, Mo., will soon take bids for a two-story mechanical shop, 50 x 160 ft., to cost over $40,000 with equipment. Charles A. Smith, Finance Building, is architect.

Chicago, Burlington & Quincy Railroad Co., Omaha, Neb., is reported planning extensions and improvements in engine house at McCook, Neb., to cost about $45,000 with equipment.

South Atlantic

BALTIMORE, July 1.—Bids have been asked by W. A. Fingles, Inc., 29 South Howard Street, Baltimore, operating a sheet metal works, for a two-story plant to cost about $65,000 with equipment. E. B. Glank, 330 North Charles Street, is architect. William A. Fingles is president.

Curtiss-Caproni Corporation, 27 Broadway, New York, and Munsey Building, Baltimore, has approved plans for initial units of new plant to manufacture aircraft on site recently acquired at Baltimore, to be one-story, 400 x 500 ft., including foundry, forge and machine shops and other departments for parts production and assembling, to cost over $350,000 with equipment. A one-story power plant will also be built. Additions will be made later to cost close to like sum. Company is affiliated with Curtiss Aeroplane & Motor Co., Buffalo.

Overhead Door Co., Richmond, Va., recently formed with capital of $500,000 by M. R. Mills, Jr., Rockbridge and High Point Avenues, and associates, plans development of local plant to manufacture doors for garages and other service, including door hangars and accessories.

City Council, Brunswick, Ga., is said to be planning establishment of a municipal airport, including hangars, repair shop, oil storage and other units, to cost more than $70,000 with equipment.

Carolina Casket Co., High Point, N. C., is planning to rebuild machine and cabinet departments destroyed by fire June 23.

A. Ten Eyck Brown, Forsyth Building, Atlanta, Ga., architect, has awarded general contract to J. S. McCauley Co., Bona Allen Building, for three-story and basement automobile service, repair and garage building, 100 x 125 ft., to cost about $125,000 with equipment.

Chief of engineers, United States Army, Washington, has authorized an early call for bids by district engineer, New Orleans, for 1,500,000 linear feet of galvanized wire rope.

Dixie Flying Service, Inc., Malcolm G. Robinson, vice-president, 41 Maiden Lane, New York, recently organized, is planning establishment of airport at Charlottesville, Va., where 125-acre tract has been acquired, to include all-steel hangar, repair and reconditioning shop, and other units, to cost about $75,000 with equipment.

Stanley Manganese Mines, Luray, Va., about eight miles from city, have been acquired by new interests, and will be reopened at once; property has been shut down for a number of months. Plans are under way for improvements, including installation of additional equipment to cost about $50,000.

Board of Education, Columbia, S. C., has plans for addition to senior high school, including a manual training shop, to cost more than $150,000 with equipment. Appropriation has been approved in amount of $500,000 for this and other school work, including new junior high school where manual training department is planned. J. B. Urquhart, Palmetto Building, is architect.

United Motors Service, Inc., Atlanta, Ga., O. J. Coe, manager, a subsidiary of General Motors Corporation, Detroit, has leased structure to be erected at West Peachtree Street and Grant Place, for new service, repair and garage building, to cost $200,000 with equipment. Ivey & Crook, Candler Building, are architects in charge.

Electric Storage Battery Co., Philadelphia, has recently placed in operation new factory branch at 210 Walker Street, S. W., Atlanta, where Exide batteries for automobiles and for various industrial purposes will be assembled. New plant is headquarters of sales and engineering staffs operating in South under direction of Mark C. Pope, Jr., manager.

Milwaukee

MILWAUKEE, July 1.—Machine-tool builders are entering the last half of the year with the largest volume of unfilled orders most of them have ever had at this season. In most shops June business fell but slightly below the average of the preceding five months, and some report bookings as large as in May. Little progress has been made toward prompt delivery, and shipment on current orders cannot be promised earlier than four to six months. Inquiries indicate continued good demand.

Milwaukee Electric Railway & Light Co., 217 Michigan Street, Milwaukee, is awarding contracts for an addition to its Cold Spring car building and maintenance shops which will require considerable new equipment. Estimated investment will be about $150,000. R. H. Pinkley, assistant general manager, is in charge.

Waukesha Motor Co., Waukesha, Wis., manufacturer of industrial gasoline engines, rail motors, etc., is considering establishment of an aircraft engine division which will not require immediate new construction, but additional precision equipment. Harry L. Horning is president and chief engineer.

Bell Machine Co., 35-59 Jackson Street, Oshkosh, Wis., is in market for miscellaneous equipment for a two-story machine shop addition, 50 x 85 ft., to be ready early in September.

Wrought Washer Mfg. Co., 46-54 South Bay Street, Milwaukee, is about to start work on a two-story addition, 75 x 140 ft. Orders have been placed for nearly all equipment required.

Nash Motors Co., Kenosha, Wis., has broken ground for a one-story extension, 42 x 145 ft., to its foundry at main works in Kenosha.

Common Council of West Allis, suburb of Milwaukee, will take bids about July 15 or 20 for installation of a 1,000,000-gal. elevated steel tank and tower and connecting main in municipal waterworks system. Bond issue of $64,000 has been made to cover cost. William Darby is city engineer.

Miami Engineering Co., Dayton, Ohio, which recently established an office and drafting room in Commerce Building, Milwaukee, is considering the installation of a plant for manufacturing tools, dies, fixtures and special machinery. A decision is expected shortly. A. V. Regan is manager at Milwaukee.

Snap-On Wrench Co., 1270 South Pierce Street, Milwaukee, manufacturer of mechanics' tools, is preparing to build a new plant costing about $85,000 for joint use with Blue Point Tool Co., 317 Mineral Street, Milwaukee, which its officers control. Present force will be doubled in new quarters. William Seideman is secretary and treasurer.

Indiana

INDIANAPOLIS, July 1.—Plans have been filed by Edwards Iron Works, Inc., 2101 South Main Street, South Bend., for storage and distributing plant, consisting of two one-story units, 75 x 360 ft., and 40 x 360 ft., to cost about $55,000 with equipment.

W. A. Gingerick, Arkon, near Peru, and associates have organized a company to manufacture iron and other metal castings, capitalized at $50,000. Plans have been approved for initial foundry unit, one story, 66 x 100 ft., to cost about $35,000 with equipment.

Norris Fertilizer Co., Rushville, has awarded general contract to D. Meinken & Son, 2143 Bernard Street, Cincinnati, for rebuilding part of commercial fertilizer plant recently destroyed by fire.

Interstate Public Service Co., Wild Building, Indianapolis, is planning construction of power transmission line from Indianapolis to Bloomington, Martinsville and vicinity; a substation and switching station will be erected on 4-acre tract at Bloomington. Project will cost about $500,000, with steel towers and other equipment.

Western Oil Co., 310 North Meridian Street, Indianapolis, has plans for a one-story machine shop and service station at Kokomo, to cost about $50,000 with equipment; similar works will be constructed at Brazil, Ind., to cost like amount. Bishop-Knowlton & Carson, 312 North Meridian Street, are architects.

United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, has plans for new one and two-story and basement plant totaling 100,000 sq. ft. floor space, to cost $200,000 with equipment. Charles E. Bacon, Odd Fellows Building, is architect. H. J. Lacey is president.

Board of Education, Speedway City, has authorized installation of manual training equipment in addition to local school, to cost about $100,000, for which bids are being asked on general contract until July 11. McGuire & Shook, 941 North Meridian Street, Indianapolis, are architects.

Davidson Enamel Products, Inc., Lima, Ohio, has started operations in a branch plant at Connersville.

Chicago

CHICAGO, July 1.—Machine tool sales in June declined slightly from the total for May. Business is more spotty, some dealers finding sales larger, while others report smaller bookings.

There is a dearth of railroad business. The only list of note was that of the Santa Fe, and the number of tools purchased was not comparable with those bought in recent years. The Rock Island is asking for prices on an axle lathe and several grinders. The Chicago & North Western is in the market for several floor grinders. The Burlington has purchased two shapers and two lathes. One farm implement manufacturer is ready to place a large number of tools and another plans to buy equipment about Oct. 1. Continental Motors Corporation, Muskegon, Mich., is said to be in the market.

K. B. Auto-Radio Laboratories, Inc., manufacturer of radio sets exclusively for installation in automobiles, has leased factory at 2925 Calumet Avenue, Chicago, containing 15,000 sq. ft. of space.

Chester A. Phillips has organized Chester A. Phillips & Co., with offices at 37 West Van Buren Street, Chicago, to deal in contractors', marine, quarry, railroad and industrial equipment, both new and used.

Contract has been let by Ostrander-Seymour Co., 1900 South Fifty-fourth Avenue, Cicero, Ill., manufacturer of machinery and parts, to G. P. Cullen, 2940 West Lake Street, Chicago, for one-story addition, to cost about $45,000 with equipment.

Jensen Radio Co., Clearing industrial district, Chicago, has plans for one-story addition, totaling about 25,000 sq. ft. floor space, to cost about $70,000 with equipment.

J. H. Murphy, care of W. G. Uffendell, 39 South State Street, Chicago, architect, has plans for a two-story power house, 65 x 120 ft., to cost about $40,000 with equipment.

Davenport Machine & Foundry Co., West Fourth Street, Davenport, Iowa, has awarded general contract to Arthur H. Newman & Co., Des Moines, Iowa, for one-story foundry addition, to cost about $50,000 with equipment. Clausen, Kruse & Klein, Kahl Building, are architects.

John Deere Tractor Co., Waterloo, Iowa, manufacturer of tractors, gas and gasoline engines, etc., has awarded general contract to H. A. Main Construction Co., Marsh Place Building, for three-story addition, 60 x 122 ft., to cost about $50,000 with equipment.

Northern Pacific Railroad Co., Railroad Building, St. Paul, Minn., has plans for extensions and improvements in engine house at Mississippi and York Streets, with shop facilities, to cost $40,000. O. M. Rognan is company architect.

Flour City Ornamental Iron Co., Minneapolis, Minn., has begun work on an expansion program to double capacity of plant, to cost about $85,000 with equipment. Company was recently acquired by General Bronze Corporation, Pittsburgh, and will be a unit of that organization.

Northfield Iron Co., Northfield, Minn., has work under way on one-story addition, 40 x 95 ft. C. L. Brown is president and manager.

Willis J. Spaulding, commissioner of public property, City Hall, Springfield, Ill., will receive bids until July 15 for extensions and improvements in municipal power plant, including boiler, underfeed or chain grate stoker, air preheater, economizer, superheater and auxiliary equipment. Burns & McDonnell Engineering Co., Interstate Building, Kansas City, Mo., is consulting engineer.

Monarch Aircraft Co., Rockford, Ill., H. L. Millington, superintendent, has awarded general contract to Tolmie Brothers, 919 Taylor Street, for one-story unit, 120 x 140 ft., for parts production and assembling, to cost more than $50,000 with equipment.

National Parking Garages, Inc., care of Walter W. Ahlschlager, 65 East Huron Street, Chicago, architect, has awarded general contract to Starrett Building Co., 8 South Dearborn Street, for multi-story service, repair and garage building, to cost more than $2,000,000 with equipment.

Cincinnati

CINCINNATI, July 1.—Buyers of machine tools have placed sufficient orders with manufacturers to keep local plants busy well into the fall. The demand is diversified and consists of small lots of machines. A leading lathe builder states that current bookings are sufficient to maintain production 50 per cent above normal into September. A number of orders have been placed by purchasers who have shown little or no interest in new equipment for many months.

Four railroads have purchased several heavy-duty lathes from a local manufacturer.

Department of Service, City Hall, Cincinnati, has awarded a general contract to William Miller & Son, 1950 Central Parkway, for steel hangar at municipal airport, 485 ft. long, with shop and repair facilities, to cost about $75,000 with equipment. Kruckemeyer & Strong, St. Paul Building, are architects.

Firestone Tire & Rubber Co., Akron, Ohio, will soon take bids on general contract for multi-story factory branch and distributing plant at Cincinnati, to cost about $150,000 with equipment. Samuel Hannaford & Son, Dixie Terminal Building, Cincinnati, are architects.

Murray Corporation of America, Inc., 1424 Aberle Avenue, Detroit, has awarded general contract to Rock City Construction Co., Nashville, Tenn., for second unit at plant at Memphis, Tenn., one story, 575 x 640 ft., to cost about $1,000,000 with equipment. Albert Kahn, Inc., Detroit, is architect and engineer.

Sterling Wood Products Co., Knoxville, Tenn., has work under way on one-story addition to automobile body parts plant, to cost over $85,000, for which general contract recently was let to J. M. Dunn & Son, 245 Broad Street.

Crane Co., 836 South Michigan Avenue, Chicago, has leased a two-story and basement building, 75 x 175 ft., to be erected at 179-81 Third Avenue, North, Nashville, Tenn., by Nashville Trust Co., for new factory branch and distributing plant, to cost about $100,000 with equipment. Hart, Freeland & Roberts, Independent Life Building, Nashville, are architects.

Reynolds Metal Co., 2934 Grand Avenue, Louisville, subsidiary of United States Foil Co., has plans by Arthur G. Tafel, 142 South Third Street, architect, for initial unit of new three-story plant, to cost about $150,000 with equipment.

Other structures will be erected later. Entire project will represent investment of over $500,000.

Tennessee-Eastman Corporation, Kingsport, Tenn., subsidiary of Eastman Kodak Co., Rochester, N. Y., has awarded general contract to Gauger-Korsmo Construction Co., Memphis, Tenn., for two of group of four new units, for production of cellulose acetate, acetic acid, and kindred products. Main building will be one and three stories, 100 x 320 ft. Entire project will cost more than $1,000,000 with equipment. Contract for additional units will be let soon, including power plant; plans for latter are being drawn by Baker & Spencer, 17 Battery Place, New York, engineers.

Board of Education, North Olmsted, Ohio, is considering installation of manual training equipment in two-story senior and junior high school to cost about $300,000, for which bids are being asked on general contract until July 10. Walker & Norwick, Third and Main Streets, Dayton, Ohio, are architects.

Gulf States

BIRMINGHAM, July 1.—A 50-acre tract partly on ship channel at Houston, Tex., has been acquired by Phillips Petroleum Co., Bartlesville, Okla., and plans are under consideration for new oil refinery to cost about $600,000.

El Paso Electric Co., El Paso, Tex., is disposing of bond issue of $4,000,000, part of proceeds to be used for extensions and improvements, including a new steam-operated electric power plant, additional equipment in present power station for utilization of natural gas as fuel, and additions to transmission lines.

Mississippi Power & Light Co., Jackson, Miss., has plans for one-story car barn, 110 x 115 ft., with inspection and shop facilities, to cost about $40,000 with equipment. N. W. Overstreet, Mississippi Fire Insurance Building, is architect.

Republic Iron & Steel Co., Youngstown, is said have plans for extensions and improvements in iron ore properties, known as Spaulding mines, near Birmingham, including electrification of mines, installation of electrically-operated loaders, mining machinery, crushers, etc., to cost about $175,000.

Southern Gas Co., San Antonio, Tex., has arranged for sale of a preferred stock issue to total $1,187,000, part of proceeds to be used for extensions and improvements in natural gas properties, including pipe line construction.

Dallas Airport Utilities Corporation, Dallas, Tex., is being organized under direction of Dallas Chamber of Commerce, Charles W. Davis, chairman of organization committee, to carry out an airport project at Love Field. Corporation will have capital of $500,000, to be secured through public subscriptions. Plans are under way for initial hangar, 200 x 300 ft., with shop and repair facilities, to cost $75,000.

Scobey Fireproof Storage Co., 315 North Medina Street, San Antonio, Tex., has plans for a seven-story electrically-operated cold storage and refrigerating plant, to cost about $400,000 with equipment.

Arkansas-Louisiana Pipe Line Co., Ardis Building, Shreveport, La., a subsidiary of Arkansas Natural Gas Corporation, same address, has plans for a natural gas compressor plant at Sterlington, La., about 20 miles from natural gas fields at Monroe, La., to cost about $1,000,000 with machinery. Station will be used in connection with new pipe line from Monroe to Shreveport, about 100 miles, and will have an initial capacity of 10,000 hp., to be increased to 16,000 hp. later.

Texas & Pacific Railway Co., Fort Worth, Tex., is planning construction of eight-story and basement storage and distributing warehouse, 100 x 600 ft., with cold storage and refrigerating division, to cost $2,000,000 with power equipment and other machinery. Wyatt C. Hendrick is company architect.

Globe Oil & Refining Co., Blackwell, Okla., has acquired property at Corpus Christi, Tex., and is said to be planning construction of new oil refinery, to cost more than $250,000 with equipment.

Houston Independent School District, Houston, Tex., has plans for a new vocational school, to cost $100,000 with equipment. Other units will be constructed later. J. W. Northrop, Kirby Building, is architect; H. L. Mills is business manager.

Pacific Coast

SAN FRANCISCO, June 27.—Pacific Gas & Electric Co., 245 Market Street, San Francisco, has plans for one-story equipment storage and distributing plant to cost $100,000. Engineering department of company is in charge.

Swanson & Peterson, Pasadena, Cal., manufacturers of furniture, have awarded general contract to M. Magnuson, Altadena, Cal., for one-story, sawtooth roof factory, 70 x 140 ft., to cost about $60,000 with equipment. Swasey & Hayne, Security Building, Los Angeles, are architects.

Columbia Steel Co., Pittsburg, Cal., plans rebuilding part of plant destroyed by fire June 22.

Standard Auto Body Works, Inc., 1501 South Central Avenue, Los Angeles, has plans for one-story addition, 100 x 140 ft., to cost $70,000 with equipment. C. Godfrey Bailey, Hillstreet Building, is architect.

Paramount Portland Cement Co., 2030 Wilshire Boulevard, Los Angeles, recently organized, has awarded general contract to Hellbush & Co., Los Angeles, for new mill at Torrance, including machine shop, power house, packing house and other units, entire project to cost about $1,500,000 with equipment.

City Council, Baker, Ore., has authorized employment of engineer to make surveys relative to establishment of municipal electric light and power plant, to cost $100,000 with equipment.

L. D. Bohnett, Bank of San Jose Building, San Jose, Cal., attorney, represents local interests organizing a company to construct and operate an airport on Alum Rock Avenue, where tract, 500 x 5280 ft., is being secured. Project will include hangars, repair and reconditioning shops and other units, to cost $150,000 with equipment.

Idaho American Phosphate Co., Nampa, Idaho, H. B. A. Arment, vice-president, has plans for new phosphate mill in Bloomington Canyon, about 3 miles from Paris, to cost over $100,000 with equipment.

Firestone Tire & Rubber Co., Akron, Ohio, has begun work on addition to branch tire and rubber tube plant at Los Angeles, to cost more than $3,000,000 with equipment.

Board of Education, Nebo School District, Springville, Utah, has plans for new mechanics art building, one story, 65 x 105 ft., to cost about $90,000 with equipment. Ashton & Evans, Vermont Building, Salt Lake City, Utah, are architects.

Canada

TORONTO, July 1.—Machine tool sales for June showed a slight improvement over those for May. Large lists were few, but a steady demand prevailed for single tools. Sales the last few days of the month showed general falling off. The Dominion Day holiday had some effect on business, and a number of prospective buyers postponed purchases until after the first of July. The outlook continues bright, and builders and selling agencies look for a large volume of business from inquiries on hand.

Alemite Products of Canada, Ltd., Belleville, Ont., will start work immediately on a two-story factory to cost $60,000. W. H. Patterson Construction Co., Patterson Block, is general contractor.

Hayes Wheel & Forgings, Ltd., Chatham, Ont., has started work on an addition, 180 x 400 ft., to cost about $500,000. E. P. Muntz, Ltd., Temple Building, Toronto, has general contract. Equipment has not yet been purchased.

Chestnut Canoe Co., Fredericton, N. B., has awarded contract to John Powers, 262 O'Dell Avenue, for an addition to cost $22,000.

Newton Construction Co., Ltd., Sherbrooke, Que., has been awarded contract by Textile Co. of Canada, Ltd., Louisville, Que., for a factory to cost $250,000. Philip Fainer, 1470 Peel Street, Montreal, is president. Charles P. Main, Boston, Mass., is engineer.

Canadian Ohio Brass Co., Ltd., Chippewa, Ont., will start work at once on a one-story addition. Smith Brothers, 1740 Ellen Avenue, are general contractors. Findlay & Faulis, 644 Erie Avenue, Niagara Falls, Ont., are architects.

William Collins & Son, Barrington Street, Halifax, N. S., have awarded general contract to Emile Bianco, 1 Kane Place, for a two-story machine shop, to cost $15,000.

Hart Battery Co., St. Johns, Que., has awarded general contract to Walter G. Hunt & Co., 1405 Bishop Street, for two one-story factories, to cost $45,000.

Canadian Gas & Equipment Co., Ltd., Montreal, has awarded general contract to John MacGregor, 1410 Stanley Street, for a two-story factory, to cost $20,000.

Western Canada

International Paper Co., Montreal, is contemplating building 500-ton paper mill at Beaver Cove on Vancouver Island, to cost about $4,000,000.

Town Council, Cardston, Alberta, has plans by Lee Gilchrist, architect, for erection of a power plant to cost $37,000.

Excavation has been started for first unit of an aircraft factory at 1927 Georgia Street, West, Vancouver, B. C., to cost $55,000, for Hoffar-Beeching Shipyards, Ltd. George Hoffar is architect. Austin Co. of Canada, Ltd., 1009 Rogers Building, has general contract.

Brunette Lumber Co., Ltd., Sapperton, B. C., is having plans prepared for a planing mill at New Westminster, B. C., to replace one recently destroyed by fire. New mill will cost $100,000.

Bids are being received by consulting engineers, Underwood & McLellan, Saskatoon, Sask., for waterworks pumping station, sewage disposal plant, etc., for town of Melville, Sask.

THE IRON AGE

New York, July 11, 1929

ESTABLISHED 1855

VOL. 124, No. 2

Handling Parts in Skids on Trucks

Boxes Designed for Multiple Lifting—Electric Lift Trucks Carry Full Loads on Established Routes

BY FRED L. PRENTISS*

TRANSPORTATION problems in a small plant are often complex and more difficult of solution than in a large factory, where, with mass production of similar parts, long hauls and straight-line routing, the use of electric trucks is often regarded as an almost indispensable method of economically handling materials in process. While readily admitting their advantage for transportation in large-production plants, the manager of a small plant may assert that electrical trucking of material would not be practical or economical in his plant.

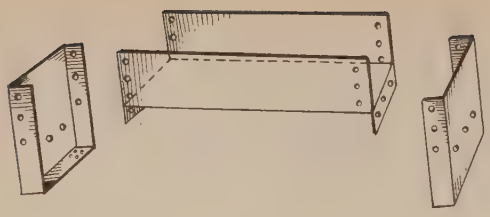
While the Elwell-Parker Electric Co., Cleveland, has used trucks for many years in its own plant, it has recently evolved a system which has improved its transportation methods and solved its handling problems. These are of a character similar to those in many plants of like size, and which include handling of material in process and, from the finished stockroom, numerous parts in comparatively small quantities. This is a plant with approximately 100,000 sq. ft. of floor space, manufacturing being done for the most part in one main four-story building. Not only does the plant as arranged require considerable cross hauling, but the work has to be carried to different floors.

The company's activities are confined to making electric industrial trucks of some 40 types. Large, standardized parts are handled on large load skids, small standardized parts in small skid boxes, and nuts, bolts and similar small pieces in nesting pans, so that the number of pieces may vary from 20 to 500.

Transporting parts economically in relatively small quantities with a standard truck is done by this company by the use of small skid boxes and tote pans, so designed

*Resident editor, THE IRON AGE, Cleveland.

A Crane Truck Loads Truck Frames on to Another Electric Truck for Transportation from the Fabricating Department to the Assembly Department. In the case of large pieces, such as this, skids of course are not needed. The crane truck can make deliveries, but is most serviceable in its own character



SKID Used for Transporting Small Parts and One of the Tote Pans for Parts Smaller Than Those Handled in the Skids (Right). Above are the three pieces of sheet steel of which the skid frame is made

that the truck can carry a load of near its capacity, made up of a number of different parts. Three of these skids are usually transported at one time. This method is used in conveying all work except some standard parts, usually moved in large enough quantities to make large single skid loads. In addition, a routing system is provided for a truck in the production department, and a card system for controlling the truck and material movements.

Manner of Obtaining Full Loads

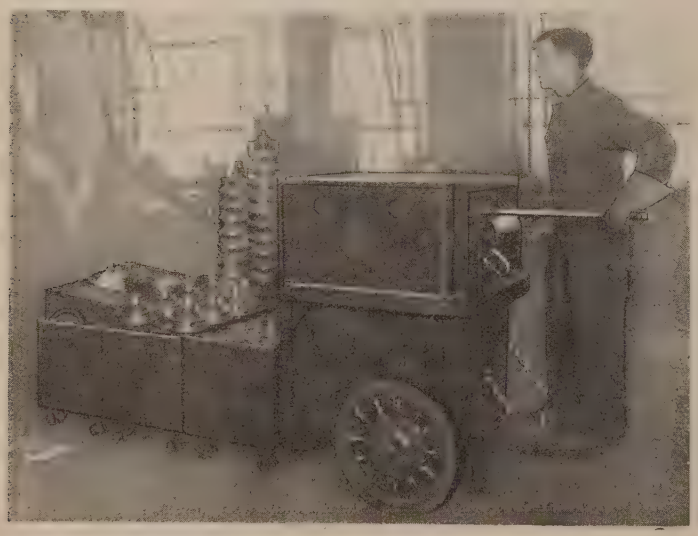
By the use of small skid boxes and handling three skids on an electric lift platform truck at one time, each skid carrying a different kind of parts, a good sized load can be moved. Tote pans, set in the skid boxes, are used for smaller parts than are carried loose in the skid boxes. With the skids and pans, a full load of various parts can be moved at one time. The saving would not be so marked in handling small loads on the electric truck, except for the element of speed. With the use of skids for handling different parts at the same time, there is a gain in speed, the electric trucks moving three times as fast as the hand trucks, and also a gain in tonnage, this being in a ratio of approximately nine to one.

Skids, designed by the company, are 36 in. long, 18 in. wide and 9 in. deep, their capacity being 3⅜ cu. ft., or 1200 lb. each. They have 11½-in. clearance from the floor to the bottom of the box, permitting a lift platform truck to be run beneath. They are made of steel plates; instead of having four legs, the ends are of solid box construction. At each corner is mounted a double-wheel caster, making the trucks convenient to be moved by hand around the machines, as well as to move to the unloading stations.

The truck serving in the production department, on which these skid boxes are handled, is of 4000 lb. capacity with a 26½ x 54-in. platform. This truck picks up one, two or three skids and can set down any one of the skid boxes making up the load. If it is carrying three boxes, it sets the three on the floor, withdraws the platform and shoves out of line the box to be left. Then the truck platform is driven under the remaining boxes, to deliver them to another point.

Tote pans are 18 in. long, 11 in. wide and 5 in. deep, and hold 60 lb. They have handles at each end and are usually set on the skids with handles resting on the edge of the skid, as shown in one illustration. The loads in the skid boxes as a rule are not flush with the skid tops, so that there is room for the tote pans to rest on the skids without disturbing the material in the skids. Each skid has a hook-hole in each end and the tote pans a hook-hole in each handle, for convenience in dragging on the floor by a hook-rod, from machine tool to the department loading point. The plant uses 185 of the skids and 500 tote pans. In addition, there are 19 large skids, 60 in. long and 36 in. wide, which are used for handling parts too large to be carried in the box skids.

Four electric trucks are in service in the plant. In addition to the one for handling the skids, a second truck is provided in the production department for carrying



METHOD of Loading the Truck. Three skids and several tote pans can be carried at one time, making a full truckload of numerous small parts. Material for a certain number of assemblies or subassemblies may thus be handled all together, facilitating the work of putting parts together

frames from the fabricating department to the assembly department, a 5000-lb. non-lifting truck for handling raw stock and a 10-ton tow tractor for moving the completed trucks before batteries are installed in them for test or shipment.

Incoming material is unloaded by means of an overhead hoist from motor trucks on to a lift truck skid, or on to the stationary platform truck, to which a trailer is attached when bar stock is being handled. This truck takes the stock to the rough stock inspection department, and then to the rough stores department if it is not needed immediately for production. This truck also takes, directly to the finished materials inspection department, parts like electric meters, bearings, horns and tires, which are completely finished when received.

Trucks Follow a Prescribed Route

A regular route is laid out for the lift truck in the production department and the operator covers this route at least once an hour. Usually the round trip does not take over 30 min., and, unless his time is taken up in special trips, the operator starts on his next regular trip before the hour is up. The routing of this truck, starting with the raw materials inspection department, is successively through the lathe and screw machine department, automatic machine and punch press department, milling machine department, drill press department, inspection department, finished stockroom, motor and controller department, assembly departments and then back to the receiving department. Two elevators are used for carrying the truck from floor to floor.

In each department are conveniently located stations for incoming and outgoing stock. From the incoming stations stock is pushed a short distance on the caster-mounted skids to the machines on which operations are to be done, and when finished, the skid is pushed back to the outgoing station. However, as the truck operator usually knows to what machine the parts are going, he frequently takes a loaded skid directly to the machine, instead of leaving it at the station. The truck carries finished parts, either on skids or in tote pans, from the finished stockroom to the truck assembly or motor assembly departments, and delivers spare parts and pans to the shipping department.

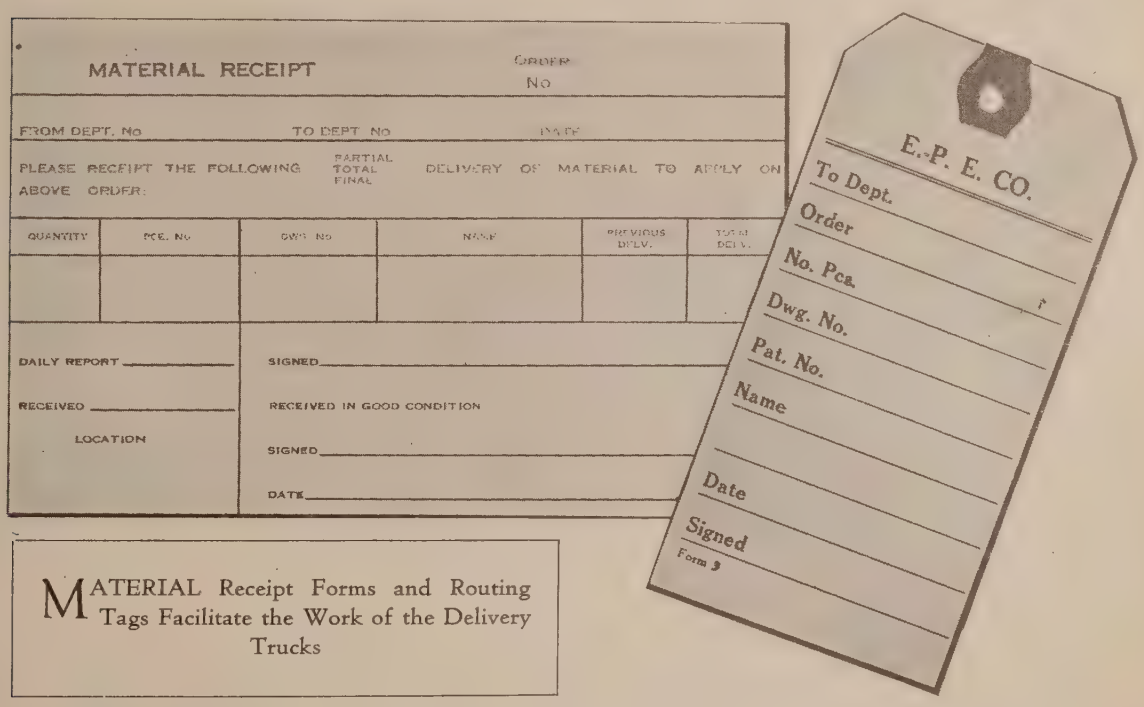
Forms Used in Controlling Material Dispatch

The truck operator gets his instructions for moving of parts by means of tags in two colors, placed on the work. Parts bearing manila tags go from one department to another; those bearing a similar orange tag go to the finished stockroom, where the tag is signed by the inspector, with the date of inspection. This card stays with the work. On these tags are spaces for listing the order number, number of pieces, drawing number, name of part and date.

Another form used is a material receipt, which is made out in duplicate for each movement of material. This receipt follows the work and shows the order number, the department from which the parts are sent, the department in which they are received, the number of pieces, the drawing number, name of part, number previously delivered, the total number delivered and whether a partial or final delivery is being made. This material receipt is signed by the foreman of the department from which the parts come and by the foreman of the department receiving them. One copy goes to the office and the other to the head of the department receiving the parts.

When parts are to be issued from the finished storerooms a material list or requisition is issued by the order department, usually covering a number of items. The head of the finished stockroom copies each item on a separate form, designating the pieces, the number and the drawing number. The pieces called for are put in tote boxes and the truck delivers them to the assembly floor. The assembly department counts the pieces as a check against the storeroom. After the requisition is filled, the stockkeeper enters on the material list the number of pieces of each item delivered, and sends the list to the assembly department, which O. K.'s it and returns it to the stockroom.

In case of shortage of some parts in the stockroom, this is indicated on the requisition by the difference between the number of parts called for and the number delivered. The stockkeeper issues to a stock chaser a shortage



MATERIAL Receipt Forms and Routing Tags Facilitate the Work of the Delivery Trucks

list, showing what is required to complete the order. Then the stockkeeper sends a copy of the material list, showing the shortage, to the stock ledger department, where a perpetual inventory is kept. The stockkeeper retains the original material list with its record of shortages. Parts to supply these shortages come from the different departments through the inspector, being accompanied with a partial "turnout" signed by the foreman. As parts to fill the shortages are received they are trucked to the assembly department.

Much Better Time Is Achieved

This system has resulted in speeding up shipments of spare parts. Formerly parts to fill these orders were picked up only once a day in a standard skid box, having 15 compartments on each side and carried by a lift truck. Now, these orders are taken care of at once and parts are prepared for shipment immediately on receipt. These orders often come by telegraph, as users of this type equipment usually wait until actually requiring parts for replacement before ordering. Very few users stock any spare parts.

Spare part orders, on arriving at the mail department, are sent through a tube to the order department, where the order is written out on manifold blanks. A copy of this is dispatched by aerial cableway from the second floor of the office building to the finished stockroom on the third floor of the factory. The order is filled at once and the electric truck takes it to the shipping room on its next trip. This plan practically assures shipping of all standard part orders the day they are received.

Since power trucks have been used for years in this plant, and the present system has been gradually developed, the principal saving has been in smoothing out schedules that assure an even flow of materials to match the speed of the machine tools through which they pass.

Marked European Progress in Non-Ferrous Die Casting

IN his paper on "Die Casting," before the Third International Foundrymen's Congress in London, June 11 to 14, D. H. Munday said that investigations, in which he had played an important part, into the die casting of copper-rich alloys confirmed his own personal experience obtained in practice, namely, that when a new die is put into operation, there is invariably a period of trial while small corrections are made, adjustments of gates and vent effected, before the most skillful workers are able to produce regularly and continuously satisfactory castings.

As to aluminum alloys, he is fairly convinced that if satisfactory castings cannot be produced under commercial manufacturing conditions in 12-per cent silicon alloy, they cannot be produced at all, for as a general rule they are less liable to "hot-shortness." They are easier to cast, have good tensile strength, generally greater elongation and impact values, and are more resistant to corrosion.

It would appear that gravity die castings are preferable when the mechanical properties of the finished castings are the chief consideration, and that pressure die castings are to be preferred when accuracy of dimension and elimination of machining are of first importance.

In spite of these conclusions, the marked success, achieved by the author's work in the production of die castings in air-pressure machines, makes one feel that there is little to be desired as to soundness of castings when prepared under the best conditions.

Much industrial research has been done to overcome all the difficulties by the Doehler Die Casting Co. in the United States, by some firms on the continent, and by the author's colleagues in Fry's Metal Foundries, Ltd., of London. The last-named company recently acquired a new process in the manufacture of die castings in yellow metals, which promises to revolutionize this section of the industry. The improvements and modifications have passed far beyond the experimental stage, and the results in actual manufacturing conditions are quite satisfactory.

How Size of Section Affects Strength of Gray Cast Iron

TO suggest a method which enables comparisons to be made between different irons melted under the same conditions, and the same irons melted under different conditions, is the aim of J. G. Pearce, British Cast Iron Research Association, in his paper, "Influence of Size of Section on the Strength of Gray Cast Iron," delivered before the Third International Foundrymen's Congress in London, June 11 to 14. The transverse test, of course, is only one mechanical test and may offer little guidance as to the ability of the metal to withstand fatigue, fluid pressure, abrasive wear, corrosion or heat. If a series of bars from a cast be tested in tension on the same-sized test piece, the values will not, under ordinary conditions, depart far from the mean, and the same applies to transverse tests. For the particular mixture and the sizes of test bars chosen there will, therefore, be a definite ratio of transverse to tensile strength. For ordinary irons and the usual standard bars this ratio is about 1.8 to 2.

Through the courtesy of Vickers-Armstrongs, Ltd., Barrow-in-Furness, England, the author tested bars of 1.2 in. and 2.2 in. cylinder iron in transverse, averaging three results in each case. The broken bars were then turned to tensile pieces of different diameters, varying in 1.2 in bars from 1 in. and on 2.2 in. bars from 1.9 to 0.2 in. It was found that tensile strength falls off very rapidly as the machined diameter increases, but that at the specified British Engineering Standard Association diameter for each size of bar the tensile strength falls within the range represented by transverse strength divided by 1.8 to 2.0. The ratio of transverse to tensile depends on the size of the test piece, and tests on other compositions will enable the influence of composition to be determined.

In a set of bars of four compositions provided by Metropolitan Vickers, Ltd., a 1.2-in. transverse bar was broken and one half turned to the standard tensile diameter of 0.564 in. and the other to the standard tensile diameter of 0.798 in. The transverse/tensile ratio varied between 1.59 and 2.18. Further examination is needed.

The strength of cast iron is determined by its composition and its structure, these factors being fixed in part by constitution of the charge and in part by the melting conditions.

Knowing Men Is Keystone of Management

"A Machine Will Do a Known Quantity of Work in a Known Time—a Man Will Do Such Work as He Is Willing and Capable of Doing"

BY ALFRED KAUFFMANN*

"ADVANCING waves of other people's progress sweep over the unchanging man and wash him out."

That statement, made by C. F. Kettering of the General Motors Corporation several years ago, is as true today as it was 35 years ago when as a boy I entered the shops of the General Electric Co. at Schenectady, N. Y.

But before we dwell on the present day situation, let's project ourselves back to the work day of 1894 and thereabouts, when we passed through the check-in gate at seven in the morning and out again at six in the evening, with one-half hour for lunch.

Those were the days when the workman bought his own wooden wash pail, soap and towel, which he kept under his bench, and hauled out a few minutes before quitting time providing the foreman or "super" wasn't looking. If luck was with you, you got home by seven; if you missed your car, no telling when you reached home. There were compensations, however; if you were tired and needed a little nap, all you did was to set your planer, shaper or lathe to cut the air, and your buddy tipped you off when the boss's feet were heard. No piece work, bonus or premium. Some contract work in rare cases, but mostly a flat day rate, and not so very much at that. Quantity and high quality of employee production, at lowest possible unit cost, meant nothing to the average employee then. He knew little of the customer's side of the picture—seldom shared in any of the gains, consequently was interested only in putting in a day's work.

*Abstract of an address before the National Association of Foremen at Indianapolis, June 8.

The Buying Public Is the Boss

And in those early years we had every so often our nice little strikes because one or the other of us didn't want to do this or that, and as we all sympathized with each other we quit, sulked, lost our pay, and finally came back, all because the fellow that hired us thought he was boss and we thought we were boss—when all the time neither of us was boss—but we hadn't learned yet that "the buying public is the boss of us all."

No matter what position we hold, workman, foreman, superintendent, manager, president, or what not, let us fail to give or to make good products, then see how quickly we'll be called to account for our work by the buying public.

Of course, the waves of progress taught us that millions were wasted in unnecessary strikes—we also learned that many losses were due to neglect on the part of the manufacturers to give the same consideration and attention to the human element of their factory as they gave to their machinery. The employees learned also that the employer was their agent who found purchasers for the product of their labor. So between the two we learned that many years of labor were needed for a worker to recover his wasted savings, or for the manufacturer to replenish his loss.

Treat 'em rough, and tell 'em nothing, was not very

A. O. KAUFFMANN

PRESIDENT of the Link-Belt Co., Chicago, Alfred O. Kauffmann has been associated with that organization since 1901. Born in Esslingen, Germany, Aug. 20, 1879, he came to this country at the age of three. After attending the public schools of New York and Rutherford, N. J., Mr. Kauffmann apprenticed himself at the age of 15 to the General Electric Co., at Schenectady, N. Y. He worked in the tool room of that plant until August, 1895, when he entered the machine shop of Robert Hoe & Co., New York, manufacturers of printing presses. While with the Hoe Company he studied at Cooper Union, New York, and in 1898 entered Pratt Institute, Brooklyn, from which he was graduated in 1901 with the degree of mechanical engineer. Immediately afterward he entered the service of the Link-Belt Co. as a draftsman in its Philadelphia branch. In 1906 he was made superintendent of construction and in 1909 he was appointed sales engineer in charge of the West Virginia territory. In January, 1913, he was made assistant to the president, at Chicago, and in July of that year was appointed manager of the Philadelphia plant in charge of operations of the company's Eastern division. In October, 1914, he was transferred to Indianapolis and in February, 1915, was chosen vice-president and general manager, the position he held until his election as president a few years ago.

far from the true relationship between management and employees in manufacturing plants in the early days.

Today, just the opposite views are held by executives whose function is the handling of employees. Men today want to know what it's all about. They are intelligent enough to comprehend the facts, and to use them constructively, and it's good business to give them the information.

Keeping Down Customer Turnover

Old customers are the backbone of any business. If we keep them satisfied with price and quality and delivery we will have less customer turnover. When these facts are brought home to employees, it will stimulate them to appreciate that their performance has a direct bearing upon the marketability of the product. Losses and wastes invariably are reduced by the arousal of interest. So I say again, consider the factory employees as part of the sales force, and tell them everything.

Modern business is organized in such large units today that in an ever-increasing number of cases men who 25 or 30 years ago would have been in business for themselves are today important factors in large corporations. Men with high qualifications devote their talents to marketing, production, accounting or some other phase of the company's business, but irrespective of its many ramifications, the fundamental principles underlying business success are few in number and simple in character.

To start with, the object of being in business is to make profits, and the index of success is the ratio of the profits actually earned to the real profit-making possibilities of the business.

Having determined what these profit-making possibilities are, the next step is to ascertain what the causes are that contribute to failure to realize these potential profits.

We must find out to what extent this failure is due to manufacturing inefficiencies—to excessive sales costs—to short-sighted or incorrect company policies—to defective accounting methods—to ineffective or inadequate advertising, or to still other conditions.

Mergers No Substitute for Good Management

Bear this in mind—mergers of small companies into one large company provide no substitute for competent management. After they are set up and operating as a unit, their earnings, as in any other form of business, depend entirely on the sound judgment and foresight of the management.

But with big business and mergers an entirely new condition was created. Industry, instead of belonging to the privileged few, is passing into the hands of the many. Today there is an army of employee-owners in every large organization. Does not this put an added responsibility on the management? The passing of a dividend becomes a serious matter, if the action hits the pocketbooks of the workmen, foreman, superintendent and company officers. Also workers who are now part owners of their companies are beginning to have a better understanding of the duties and difficulties of management.

Now what part do we play in this picture? Most of us in this room are interested in the manufacturing end. What proportion of the failure to get the best out of our plants can be pinned on us? We all know that an industrial plant is only a mass of junk unless some one is around to see that the bricks, mortar and machinery become tools of production. And that takes human beings.

There may be all kinds of trends in industry—mergers, consolidations and what are sometimes called vertical trusts; or history may bring about the cutting up of the big units into small ones again, but what will always be needed will be men to do things. Men are not such certain quantities as money, materials and machinery. A machine will do a known quantity of work in a known time. A man will do such work as he is willing and capable of doing.

Men, then, are the most important factors in the conduct of any business. And what difference does it make whether we mention this before a gathering of foremen, salesmen or executives, when the cry is always the same. Forget the title tacked on to our names, and look at it from the big opportunity standpoint. Men grow by having responsibility laid upon them. You may be a foreman today and a superintendent or manager tomorrow. The same applies to the workman under you. In a sense you are his manager. Encourage him, let him know that he has a chance to get ahead, and that his chance lies in himself, and you will get further than through any scheme of profit sharing, bonus, or welfare work, though they all may be very helpful.

Employees Need Encouragement

The chance to say "Yes" to the question, "Am I getting on?" is what appeals to most men.

You men here who are foremen—

You know better than I do the many petty things that come up during the day or week, the burden of which must be borne by you. You know the most important factor is maintaining high quality and low cost. Why tell you anything about the direct loss due to spoiled work, or that rush jobs are always more expensive than regular jobs?

Some of you may, but all of you should, have practical knowledge of manufacturing economies and accounting—have a clear insight into such overhead items as equipment depreciation—tool cost—scrap charges—supply costs—supervision and inspection charges and the like—in their relation to direct charges and total costs.

But more important than all is a working knowledge of *human beings.*

Unreduced Oxides in Pig Iron

A STUDY of the origin of non-metallic matter in pig iron and its behavior in steel-making processes, being conducted at the Pittsburgh experiment station of the United States Bureau of Mines, in cooperation with the open-hearth committee of the American Institute of Mining and Metallurgical Engineers and the Bourne-Fuller Co., Cleveland, has shown that it is always present in any grade of pig iron, but that it is present in fairly small amounts unless the blast furnace is working irregularly. The average percentage in 61 samples of basic pig iron was 0.0272, in 50 samples of Bessemer iron, 0.0223, and in 15 samples of foundry iron, 0.0078. The oxide content of the metal is increased during transfer from one vessel to another, such as from the blast furnace to the mixer or from the mixer to the open-hearth, due to oxidation of the metalloids in the iron. When the blast furnace is operating irregularly the proportion of non-metallic matter may go as high as 0.15 to 0.20 per cent.

These non-metallics are composed of silica, and iron and manganese silicates, and analyze approximately 50 per cent silica, 30 per cent iron oxide, 15 per cent manganese oxide and 5 per cent alumina. When pig iron is converted into steel some of these unreduced oxides remain in the steel and it has been shown that high temperatures, high residual manganese and fluid slags are favorable for their elimination. In certain cases, the quality of the steel could be related directly to the amount of unreduced oxides in the iron used in making the steel.

Fine Springs Need Close Tolerances

Small Errors in Size and Shape Result in Large Variation in Load-Carrying Ability—Heat Treatment Affects Elasticity and Fatigue

BY R. W. COOK*

THIS paper will endeavor to indicate some of the things which a spring maker can and cannot do, and how variations in sizes (which may seem quite negligible to the uninitiated) have a large influence on the work which the spring will be able to perform.

For some reason spring manufacture has commonly been looked upon as an art rather than an applied science, and there has always been an atmosphere of mystery surrounding the so-called "art of tempering." Many people are under the impression that the spring maker, through some uncanny power, can make a spring stronger or weaker by some change in the heat treatment. To dispel these errors it will be demonstrated, first, that a spring to support predetermined loads is the result of good engineering design and not of heat treatment; and, second, that a spring made of annealed wire would support as much load as one of the same shape and size that was heat treated or cold drawn provided the elastic limit of the soft material is not exceeded.

Metal in the form of springs has the same physical characteristics as though it were used for other engineering parts. For instance, it obeys Hook's law, which states that stress is proportionate to strain up to the elastic limit of the material. In other words, if a spring deflects 1 in. when supporting 100 lb., it will take 200 lb. to deflect it 2 in.

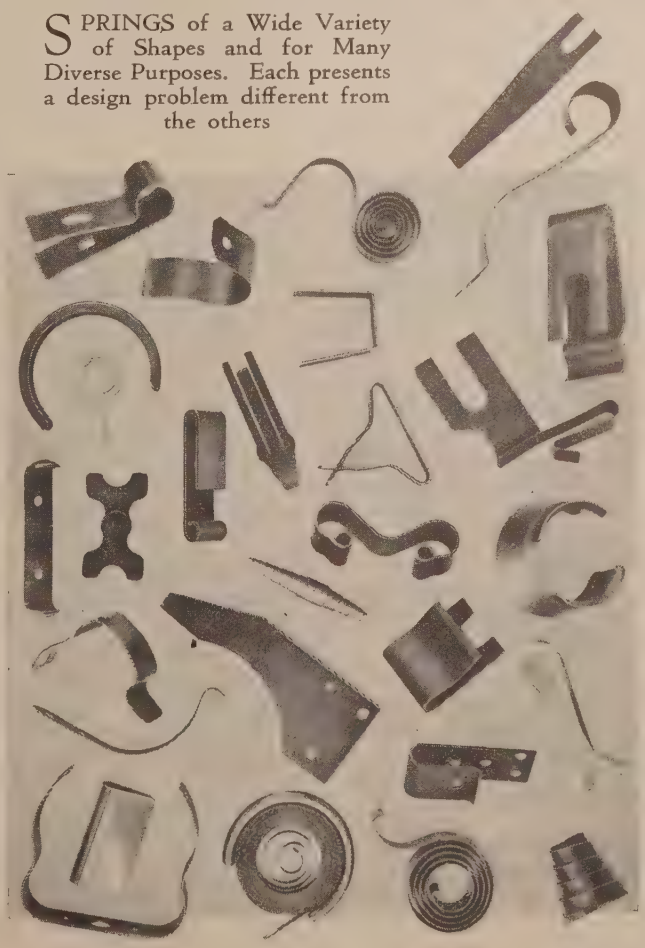
The physical properties used for designing or laying out springs are the same as the engineer would use in designing a bridge, a gear or an automobile axle—the major difference being that, instead of designing the spring as he would a bridge to sustain certain loads with as little deflection as possible, he plans them to deflect a definite distance under a definite load, to return to exactly the same position when the load is removed, and to repeat this exacting operation indefinitely.

Some materials are fine for springs and some are no good at all. For instance, cast iron is useless for spring purposes; a piece of stick sulphur would take no deflection whatsoever before breaking; a piece of rubber, which might be capable of being stretched a great distance and return to its original length, would make a poor spring because it moves too far for a small load. In spring steels we not only have a high elastic limit, but we have a high resistance to stress (or "stiffness"). These two are the important characteristics; the total usefulness of a piece of metal, as far as the manufacture of springs is concerned, is expressed by a combination of its stiffness and its elastic limit.

Stiffness Measured by Young's Modulus

This matter of stiffness is expressed in standard terms, so that one material can be compared with another, by means of Young's modulus of elasticity. Young first discovered that the stiffness of a material and the amount that it could be deflected were two entirely separate factors. Young's modulus is found experimentally by dividing the load on a test piece by the amount it stretches. It is expressed, therefore, in pounds per square inch. If we are talking of Young's modulus in tension, we mean the number of pounds which it would require to stretch a 1-in. block of the material until it measured 2 in., assuming that this could be done without passing the elastic limit.

The peculiar part of this physical property is that Young's modulus for all steels is approximately the same number. The slight variations noted in the experimental determinations are not brought about by heat treatment but by other factors, such as



SPRINGS of a Wide Variety of Shapes and for Many Diverse Purposes. Each presents a design problem different from the others

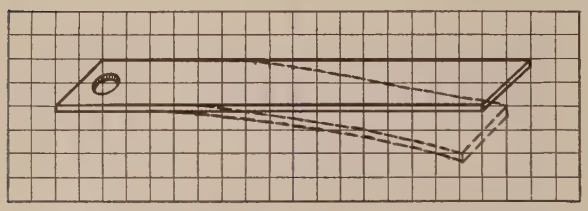
*Vice-president and factory manager, Wallace Barnes Co., Bristol, Conn.

chemical analysis and size of test piece. For all ordinary spring calculations we can treat the modulus as a constant; for steel in tension use 30,000,000 lb. per sq. in., and 12,000,000 lb. per sq. in. for steel in torsion. Of course, if bronze or some other metal is to be used, we then have to substitute the modulus for that metal in the formula.

We therefore find that formulas for unit loads on springs contain constant factors or physical dimensions. Consequently *design* alone, and not heat treatment, controls the unit load.

Deflection Controlled by Elastic Limit

The other physical property of metals used in spring engineering is the elastic limit, which controls the distance that a spring can be deflected without permanent set.



Flat Spring Deflected at One End. 0.0005 in. variation in thickness of 0.010-in. strip makes error of 16 per cent in load-deflection test

Elastic limit is directly dependent on the quality of the material and its heat treatment, it enters into the formula for total capacity of a spring, but is the limiting factor only when springs are to be used at maximum capacity. Needless to say, this condition should be avoided when possible, but is encountered in some important spring work, such as clock springs.

Either the elastic limit or the ultimate strength of the metal is also connected with the endurance of springs on repeated loadings. Not nearly enough is yet known about this important subject. Since heat treatment can affect the elastic limit and the ultimate strength, it also must have some indirect relationship to the endurance. Some authorities who have studied metal in straight test pieces claim that the endurance limit (that is, the load which can repeatedly be placed on the metal without ultimately breaking it) is raised as the tensile strength goes up, either by alloying or heat treating. This appears contrary to the old, old rule of thumb in the spring industry: "for fatigue conditions use the lowest temper* that will do the work without taking set."

Test Results Affect Manufacturing Conditions

Another method of testing used in the laboratory of Wallace Barnes Co. is to deflect springs under definite operating conditions until they break, and continue to vary the manufacturing conditions one at a time until the combination is found which gives best results. One definite finding may be noted: overheating, especially of steels containing more than 0.90 per cent carbon, is a prolific cause of erratic performance. We have also been able to prove that the rule of thumb mentioned above has a basis in fact, namely, that a low tempered spring will actually do far more work than a high tempered spring.

Therefore, a most important result of heat treatment is to be found in producing uniformly good fatigue properties, and this field of research is yet only in its infancy. Probably we will eventually find that a certain microstructure and hardness will deliver more work than any other.

To conclude this portion of the discussion, springs should be designed so that their work is well within not only the elastic limit but the predetermined endurance limit for that particular metal. All of which substantiates what has been indicated so many times in practice, that if springs have suitable hardness and still do not perform, the design should be changed rather than hardness increased. The latter results in erratic fatigue resistance.

*"Low temper" here means low carbon or low hardness, rather than low drawing temperature.

Close Tolerances Frequently Necessary

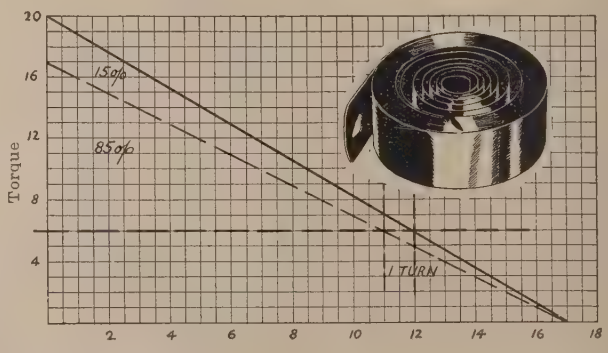
Having indicated the limitations of heat treatment as relates to the performance of springs, the matter of tolerances may now be considered briefly. By taking a few examples a great amount of light can be shed on spring design in general, and a new idea acquired of the degree of accuracy required in the manufacturing of small springs.

Take the insignificant lever spring in the distributer of an automobile engine. It gets scant attention, but it must return the circuit breaker lever to its original position with correct tension within two ounces, plus or minus. It will do this 250,000,000 times while an eight-cylinder car runs 25,000 miles. Or we might consider the control which advances or retards the spark as the throttle is opened or shut; it is actuated by a spring which will not vary in length over 0.005 in. under a given loading. Such examples could be multiplied indefinitely.

Such limitations mean the accurate control of more dimensions than are met with in most machine parts.

Causes of Variations in Wire Size

One of these is dimensional tolerance in the material itself. Without discussing this in detail it is interesting to note a few causes of variation in cold rolling a strip of steel, such as variation in size and quality of the hot rolled bars, change of temperature in the rolls, bending of the rolls during cold rolling; "give" in the roll necks and bearings; eccentric grinding of the rolls; and extreme difficulty of gaging strip while it is traveling at 100 ft. per min. Similar causes of variation might be found in wire drawing, and while these variations might amount to only 0.001 in., or even a quarter as much, they affect vitally the action of the spring, as will be demonstrated later. Then come



Clock Spring, Normally 0.020-In. Thick, if 0.001 In. Undersize Would Lose 15 Per Cent of Total Energy and 8 1/3 Per Cent of Running Time

the difficulties of fabricating the spring itself, not only in forming it to the correct shape, but the much more difficult task of heat treating it without deformation.

Thickness of Flat Wire Most Important Dimension

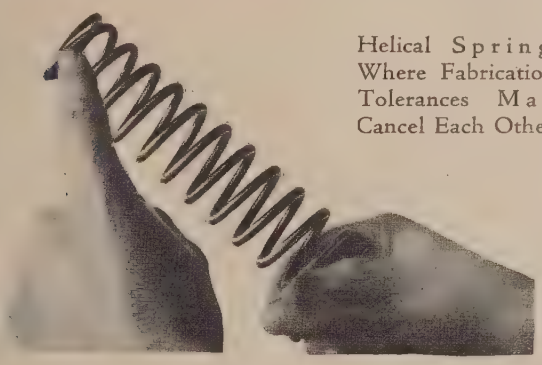
For the first example to show how these slight variations affect the test or performance of the spring, assume a sample flat spring, such as many illustrated in the group on the first page of this article. It is fixed at one end, like a cantilever beam. It has 6 in. effective length, it is 1 in. wide and 0.065 in. thick. It will deflect

approximately 1 in. if 10 lb. is hung on the free end, according to the formula—

$$f = \frac{4pl^3}{Ebh^3}$$

In this, f equals the deflection, p the load, l the length, E the modulus of elasticity in tension, b the width of the stock, and h the thickness. It will be noted that the deflection varies directly as the first power of load and as the cube of the length, and varies inversely as the modulus (which is a constant), the width, and the cube of the thickness.

In such a spring all these factors can be easily controlled except the thickness. It is subject to variation due to the conditions in the rolling mill previously mentioned.



Helical Spring, Where Fabrication Tolerances May Cancel Each Other

Note that the thickness has a very important effect on the load (or the deflection, as the case may be), since it enters into the formula in the third power. Suppose the spring is bought under a specification which says that the load to cause a deflection of 1 in. shall be 10 lb. plus or minus 5 per cent. That means that the thickness of a nominally 0.065-in. strip can vary only plus or minus 0.0015 in. This is less than the commercial tolerance for rolling this thickness of material.

Variations in thickness become more important as the spring gets thinner. Thus, assume a tolerance of plus or minus 0.0005 in. for a 0.010-in. strip (which would be considered excellent accuracy in rolling). That alone would cause a variation of plus or minus 16 per cent in the load required to give standard deflection.

Another good illustration is a clock or phonograph driving spring, such as shown at the bottom of the illustration on the first page. The formula is

$$f = \frac{12plr^2}{Ebh^3}$$

Here also the load varies as the cube of the thickness. If the thickness of an ordinary phonograph spring is decreased from say 0.020 in. to 0.019 in., other factors being equal, the maximum torque would drop from 20 lb. to 17 lb., a loss in maximum torque and total energy of 15 per cent. If such a spring 0.020 in. would give 12 effective turns on its arbor under the working condition, and the steel were 0.001 in. undersize, one total turn would be lost. This means 8⅓ per cent of the running time of the spring-driven motor.

Errors in Helical Springs May Mutually Counterbalance

Variations in size have even more noticeable effect on helical springs, such as valve springs, but fortunately there are several variables entering into that formula. Some of these variables will run over and some under, with the net result falling within the specified tolerance for length or compressibility. For instance, an actual specification calls for a valve spring 2 7/16 in. long, 1 7/16 in. mean diameter, with 7¾ coils of 0.162-in. wire. It is required to be 2 in. long under 30.25 lb. plus or minus 1 lb., and 1 7/16 in. long when loaded to 61.5 lb. plus or minus 1.5 lb. The formula for the unit load of such a spring is

$$\frac{P}{f} = \frac{d^4G}{64nr^3}$$

The unit load varies directly as the fourth power of the wire diameter and the modulus in torsion, and indirectly as the number of coils and the cube of the mean radius.

In order to be within the tolerance allowed in the load test, the wire diameter must be correct to 0.001 in., other dimensions being exact. Or we may take 0.010 in. tolerance on the diameter of the spring, or allow one-seventh of a coil on the number of coils, or 0.015 in. on the length. Each of these figures taken separately is too close a limit for mass production. The ordinarily accepted tolerances on such a spring would be plus or minus 0.002 in. on the wire size, plus or minus 1/32 in. on the diameter, plus or minus 3/32 in. on the length of the spring, and plus or minus one-half coil on the number of coils. Fortunately some of these errors in production will be on the high side while others fall on the low side, and thus partly counterbalance each other. Otherwise it would be a matter of great good fortune to find a spring which would fall within the specified acceptance limits.

While spring makers who take pride in their product like to work to close tolerances (and like to collect the premium which precision always warrants), the above explanation indicates that the limits should be chosen with judgment. Accuracy should be asked for where accuracy is actually needed, and latitude allowed where latitude is possible. If a designer who is used to dimensioning machine parts to plus or minus 0.002 in. should do this out of mere force of habit when ordering springs, he may inadvertently place conditions upon their manufacture which will cause exasperating delay and unwarranted expense.

Nitrogen Content of Steel Is Harmful

There has for a long time been controversy as to the effect of nitrogen in steel, many claiming that it is harmful. A Norwegian, Hjalmar Braune, discusses various problems connected with this subject in a Norwegian technical paper, according to the London *Iron and Coal Trades Review*.

When pig iron is made in charcoal blast furnaces, nitrogen is usually present in the iron in quantities of about 0.002 to 0.003 per cent, if the furnace is worked at a moderate speed and without excessive preheating of the blast. However, with hot-blast and high-speed working, the nitrogen content will be considerably higher—often 0.020 to 0.025 per cent, owing to the increased formation of cyanogen compounds in the furnace. It has long been known by manufacturers and consumers of high-grade pig iron that furnace working conditions have a great influence on the quality of the iron, even if the ordinary analyses are identical with exceedingly low contents of sulphur and phosphorus.

According to the author, it has always been almost impossible to make a first-grade steel from hot-blast iron —a fact recognized as a function of the nitrogen content, which causes an excessive brittleness in the hardened steel. Buyers of Swedish pig iron, therefore, often used to stipulate that the iron should be produced under fixed working conditions, such as cold blast (not above 150 deg. C.), moderate speed, etc.—conditions which cannot easily be controlled by the consumer. It is recommended, therefore, in such cases to adopt the determination of the nitrogen content as the standard test, since this can easily be determined, and will give clear evidence of furnace working conditions.

Automobile Hardware to Be Forged

Transition from Castings and Stampings Suggested—Methods of Production and Heat Treatment in a Versatile Plant

BY F. W. MANKER*

BETTERING the quality of materials and workmanship, a trend of craftsmanship in the times of our forefathers, also dominates the present age of mass production. Probably the outstanding example of this today is the trend in the automobile industry toward better performance, greater endurance, longer life and greater beauty in lines.

This applies to the individual parts just as forcibly as it does to the completely assembled car. Among the parts that go to make up a car the automobile hardware includes such items as crankshafts, steering knuckles, clutches, brakes and accelerating pedals, shift levers, yoke end assemblies, brake band assemblies, disk clutch plates, etc.

Organized in 1881 for the manufacture of vehicle hardware, the Cleveland Hardware Co., Cleveland, is today the largest maker of vehicle hardware in the world and the only one in the United States that produces a full line. During its early years it made hardware for buggies, sleighs, farm wagons, etc.; with the advent of the automobile this line was added. This company made the hardware for the first commercial automobile—the Winton. At present 85 per cent of its output goes into automobiles and tractors, but it is still making hardware for farm wagons. Every American car today carries some parts made in the plant of this company.

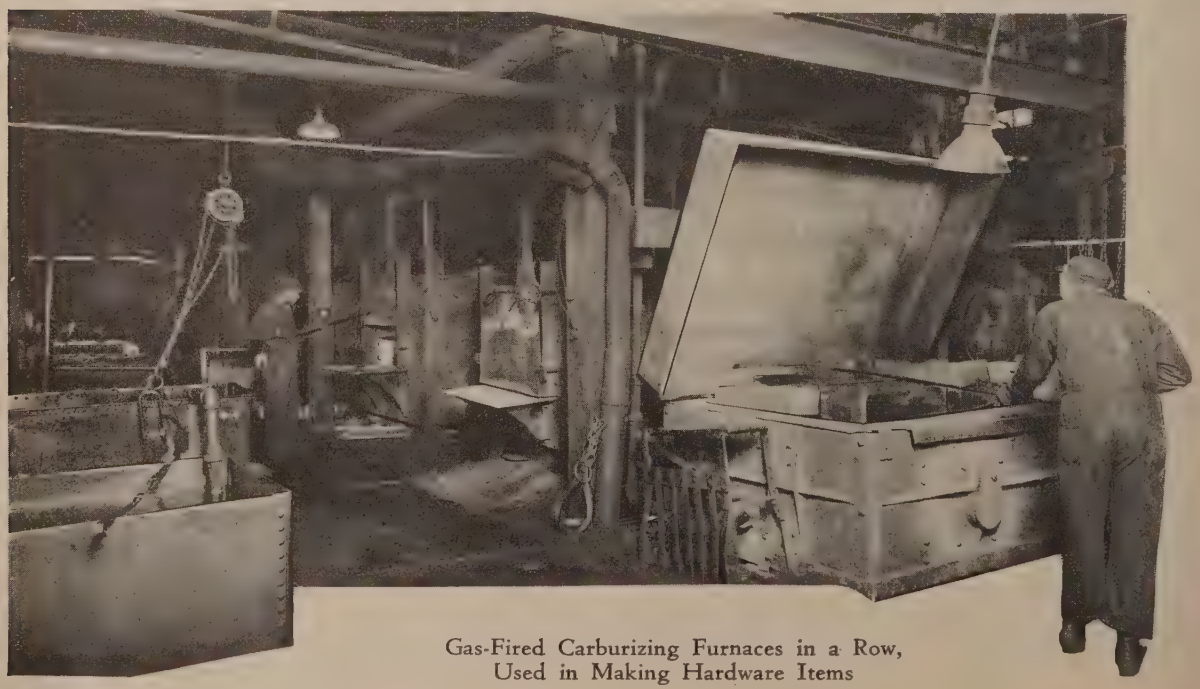
Originally the metal parts of buggies and farm wagons were castings, but this company saw the gradual transition to wrought iron and steel. This same transition is just starting in the automobile industry and, while castings and stampings are still largely in vogue, there is little doubt that the automobile hardware of tomorrow will be of completely forged parts.

At least 75 per cent of the line manufactured by the Cleveland Hardware Co. includes some part which is drop forged. While this company makes and stocks thousands of parts of different types, approximately 60 per cent of its output is special work made on contract, and according to the blueprints and specifications of its customers.

This firm operates its own rolling mill, where it rolls special shapes. Much of this steel is later put through the upsetting or forging processes. There are two plants, five miles apart, each a duplicate of the other, except that the rolling mill at No. 1 does for both.

In the rolling mill are six stands in one train, and an independent mill; all are three-high. Two sizes of billets are used, 2 x 2 in. and 4 x 4 in. These are heated in two regenerative billet furnaces which are fired with gas, a temperature of 2200 deg. Fahr. being maintained. The hearths are 7 x 12 ft. and 7 x 14 ft. Each furnace has two gas burners on each side, and the standard reversing

*Assistant to the president of the Great Lakes Steel Corporation, Detroit, but, when article was written, vice-president of the Surface Combustion Co., Toledo, Ohio.



Gas-Fired Carburizing Furnaces in a Row, Used in Making Hardware Items

Corner of Heat-Treating Department, with Two Rows of Gas-Fired Furnaces

Mechanical Handling of Parts to and from Heat-Treating Furnaces Is Provided for by the Hand-Operated Overhead Crane. Pyrometric control of these furnaces insures repetitive results

Long Line of Trimming Presses Served by Belt Conveyor Which Carries the Parts to Tumbling Barrels for Cleaning

mechanism. Natural draft is supplied through a 175-ft. chimney.

The independent mill is used to roll ruptured bar stock, which saves certain operations in forging. A row of board drop hammers, up to 2 tons in capacity, as well as bulldozers, presses, etc., are used to work the steel. Hot-trim presses are placed alongside the hammers, while the cold-trim presses are in an adjoining department.

These latter are arranged in a long line, supplied by a traveling belt conveyor. The forgings are placed on this in the hammer room and are carried along just back of the presses. The operators on the different presses pick off the parts which their particular press is equipped to trim, trim off the flash and drop the parts on to a short conveyor running at right angles to the supply conveyor.

These short conveyors dump the parts on to another long conveyor running parallel to the first conveyor, which delivers them to the tumbling barrels in another section. When full, these barrels are put on to stands and revolved.

This ganging system, of belt conveyors to bring work to and remove it from the operators and machines, is used throughout the plant wherever applicable, thus eliminating as much trucking, hauling, etc., as possible. The forge shop is equipped with an overhead traveling crane of 120-ft. span, while the other shops and machine divisions are served with overhead monorail systems and electric hoists.

The company makes its own tools, dies, jigs, etc., in a completely equipped and modern tool room. The various forged and cast parts are finished in the machine division, which is fully equipped with milling machines, drill presses, reamers, thread cutters, etc. Several types of special machines are provided for special operations.

Exceptionally modern and up-to-date equipment, arranged for the most effective and efficient operation is found in the heat-treating room. There are 18 gas-fired furnaces in this room, a row of nine on each side with quenches in between, and a traveling overhead crane to assist in handling the work. These furnaces are 7 ft. wide, 5 ft. deep and 6 ft. high and are all alike.

They are used interchangeably for all kinds of heat treating, annealing, etc. Each has automatic pyrometric control and is both overfired and underfired, with two burners located in the crown and two alongside the hearth. These are provided with Surface Combustion Co. (Toledo, Ohio) inspirators and combustion equipment, through which gas is supplied at 15 lb. pressure.

A battery of six recording pyrometers is set on the wall of the metallurgist's room, together with a switchboard to which is wired the thermocouple in each furnace. In this way an exact control is maintained over the operation of each unit.

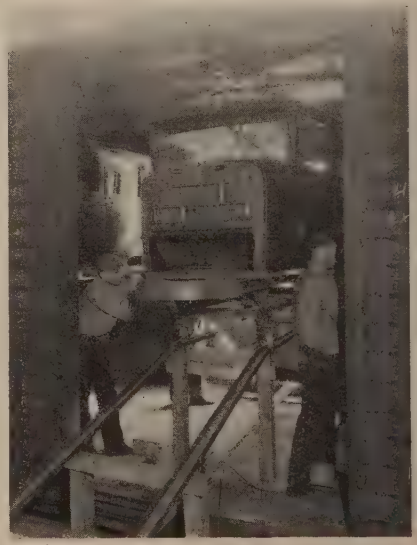
For hardening die blocks the practice is to heat them up to from 1400 to 1600 deg. Fahr. and soak them for from 8 to 12 hr., according to size and physical requirements. They are then drawn at temperatures ranging from 800 to 900 deg., after being quenched in oil. These quenches are cooled by recirculation. This gives a hard face and tough matrix. The drawing is accomplished on cast iron plates set in brick and underfired with four burners.

Great improvement in performance of modern over obsolete equipment is shown by these furnaces, as disclosed by tests with the old combustion system and the new equipment. In heat treating forgings, when the temperature was maintained constant, and the cold work was regularly charged into a hot furnace, a saving in fuel consumption of 46 per cent has been effected, together with a 25 per cent increase in production. And there is a material reduction in furnace maintenance and scale loss.

These economies were effected through the use of inspirators, or gas-air proportioners, by which the gas-air ratio is regulated to give either a reducing or an oxidizing furnace atmosphere. The desired ratio once attained is then maintained automatically, regardless of the flow of gas.

Shipping Automobile Bodies to Utilize All the Space Available in a Box Car

INTERIOR of Freight Cars (Left) Is Arranged to Accommodate Three Tiers of Touring Car Bodies, with 20 Bodies to a Car. Sedan bodies (right), being taller, are loaded in freight cars, two high, for shipment to Detroit, from Graham - Paige Body Corporation, Evansville, Ind.



Europe's Industrial and Political Future Pivots on Coal and Iron Ore

Four Countries Hold the Key to the Reparations Problem—All Must Increase Greatly Their Production for Export—Some Economic Dislocation Ahead

BY EDWIN C. ECKEL*

THIS study of the coal and iron ore supplies of the different European countries is not primarily geologic, nor is it concerned with a very hypothetical future exhaustion of coal and ore reserves. On the contrary it is concerned with the immediate future, industrial and political, also with the bearing on that future of these coal and iron resources and their development. For I am, as will appear, an advocate of the very unpopular theory that we are *not* now living in a new age of economic miracles, but still in a cold, prosaic world where effects are produced by causes.

Today, after a speculative mania such as has never before been seen, every security market in the world is in a hopelessly unsound position. Under normal conditions the inevitable remedy for this would be a speculative collapse, which might cause great individual suffering but not necessarily any great general economic loss. But in the present case the situation is irretrievably compromised by the colossal mass of inter-governmental obligations arising from the war—obligations which must in the long run be paid for by the export of goods on a most tremendous scale. And it may be noted that whatever paper agreement may be reached on the German reparations matter the economic dislocation will be more severe than anything the industrial world has yet seen. [As Mr. Eckel wrote, the reparations conferees at Paris were still in disagreement.—EDITOR.]

There are several countries which must secure reparations in full in order to avoid bankruptcy. There are other countries whose furnaces and mills might as well shut down for the 50 or 60 years during which such payments are in progress. It is obvious that the coal and iron industries, which are after all the only real bases for German earning power, are the ones most keenly interested in the whole matter. And that gives a certain point and timeliness to the present study.

Europe's Coal Percentage Half That of Ore

Before considering actual and probable future developments in Europe itself, it will be well to note very briefly the status of the European continent as a whole, with regard to coal and iron ore reserves and output.

In dealing with unmined reserves it is never necessary to waste energy on any attempt at precision, since such factors as grades, depths and workability are subject to a wide range of individual judgment. So in the present case we will deal with the subject in very round tonnages and percentages, feeling that this will bring out all the really important points with sufficient definiteness.

With regard to coal, we may then note that, on any possible basis of comparison, Europe ranks third, and a rather bad third, to North America and Asia as a holder of unmined coal reserves. The total high-grade coal in Europe, at reasonable depths, may run to some 750 thousand million tons. This is equal to between 15 per cent and 20 per cent of the total world coal reserve, figured on the same basis. Low as compared with the two other continents named, the European reserves are still enormous as compared with those of the three remaining continents, and probably three or four times as great as those of South America, Africa and Australia combined. As against this reserve tonnage, all Europe combined will mine this year not much over 800,000,000 tons of coal and lignite of all grades.

With regard to iron ore, the European situation is even more favorable. On whatever basis we may figure, the European total reserve will fall between 30 per cent and 40 per cent of the total known iron ore reserves of the world. This is being drawn against this year at the rate of something under 100,000,000 tons. The ore mined in Europe has from 1912 on ranged between 50 per cent and 60 per cent of the world total output.

Racial and Raw Material Factors

If we dropped consideration of Europe with this brief summary of its coal and iron resources, however, we would be missing most of the story. For we have in addition to take into consideration certain other facts, physical and human. On the one hand we must consider that Europe has on the whole a climate fitted for white occupation; that its irregular and deeply indented coast line gives access to most of its coal and iron ore deposits, and that the vast bulk of these deposits look toward the Atlantic basin as an outlet. On the other hand, we must consider the facts that Europe was, if not the birthplace, at least the nursery of the white race; that it is still the home of at least 75 per cent of that race; also that more than nine-tenths of all our progress in art, science and technology, during our slow advance from barbarism, has originated in Europe. To which I might add, as a purely personal judgment, that this percentage has not decreased in recent years and is likely to increase, rather than decrease, in the next few decades. For the richer the country, the stupider it is likely to become, since invention and discovery are direct functions of hard necessity rather than of comfort and luxury.

As a final matter of interest, we might pay a little attention to the manner in which these European coal and iron resources and outputs are concentrated, for it will be seen almost immediately that they are not distributed generally and evenly over the face of the continent of Europe. They are, as a matter of fact, concentrated to a very surprising degree. For as regards iron ore, seven countries possess about 95 per cent of the total iron ore reserves of Europe, while four of these account for over 72 per cent of the total European iron ore reserve. As to actual iron ore output, the production is in almost exactly the same ratios—the same seven countries produce 94 per cent of the total European output; the same four produce 72 per cent at least.

As to coal, we have again seven countries producing over 95 per cent of the total European coal output, and possessing over 96 per cent of the total European coal reserve. And of these seven, four produce over 80 per

*Mr. Eckel is spending several months in France and Germany, in the interest of American clients.

cent of the total output and possess over 83 per cent of the entire European coal reserve.

Four Countries Control Coal and Iron Ore

To give final precision to this matter, the European countries are listed below in the order of their current iron ore and coal outputs:

	Coal Output	Iron Ore Output
Germany	1	4
Great Britain	2	5
France and Sarre	3	1
Poland	4	..
Czechoslovakia	5	..
Russia	6	6
Belgium and Luxemburg	7	3
Sweden	..	2
Spain	9	7

It will be seen that the four countries which consistently rank highest as regards coal and iron ore resources and outputs are Germany, France, Great Britain and Belgium, while those which rank relatively high in one of these two basal products, but not in both, are Poland, Czechoslovakia, Russia, Sweden, Spain.

A number of countries which figure on the European map are not mentioned in either of the lists above. Such are Italy, Portugal, Greece, Turkey, Roumania, Bulgaria, Ireland, Denmark, Norway, Latvia, Lithuania, Esthonia, Finland, Holland, Switzerland. Some of these may be fit placements for American loans; some may be interesting tourist resorts. But from our present coldly materialistic viewpoint, none of them can be considered as serious factors in the future of the world. None of them can ever have any serious output of manufactured products for export; none of them can ever supply the materials necessary to keep an army or a fleet in action. None of them, by consequence, will ever be taken seriously in any diplomatic or political dispute. For this world is not ruled by charity or kindness but by steel

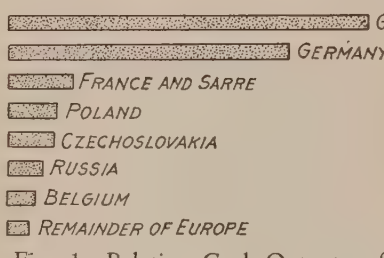


Fig. 1: Relative Coal Outputs of European Nations in 1913, Based on Their Post-War Boundaries so as to Permit Direct Comparison with Later Results, as in Fig. 2

and coal, and a nation which cannot produce either of these may be a very interesting geographical expression—but nothing more.

Concentration of Coal Industry

In merely naming the European coal producing countries without considering their geographic locations we are apt to miss one point of supreme importance—the intense geographic concentration of the European coal industry, disregarding national boundaries. In 1913, for example, all of Europe was producing some 720 million tons of coal and lignite annually. But of this total practically 600 million tons or 83 per cent was produced in northwest Europe alone, leaving only 120 million tons for the total output of central, southern and eastern Europe. And today, after 15 years of war and reconstruction, we find that the old relations are almost exactly re-established, for out of an 800 million ton output in 1928 northwest Europe produced over 665 million tons as against 135 million tons in the rest of the continent.

We have heard a good deal—chiefly in connection with new loan flotations—about the rapid development of the repaired or newly made countries of central and eastern Europe. But after all it is the old coal and manufacturing territory of Germany, France, Belgium, Holland and England which has not only regained its former status but has increased its pre-war lead in all lines of industry.

Europe as a whole increased its coal output about 11 per cent in 15 years. This is a very low rate of increase,

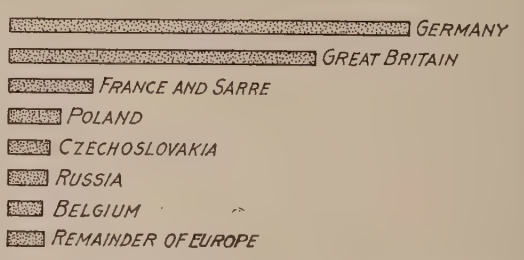

Fig. 2: Relative Coal Outputs of European Nations in 1928, Same Scale as Fig. 1. It will be seen that except for loss of leadership by Great Britain to Germany there has been no change in rank of the seven leading coal-producing countries

probably by far the lowest for any equal period in the last 150 years. But in the closely placed group of five nations above named, the group increase was somewhat over 12 per cent. And this in spite of the fact that one of its leading members, Great Britain, showed an actual loss of some 25 per cent during that period, which was more than compensated for by an increase of 35 per cent in the German output and lesser percentages in the others.

We have, therefore, not the slightest reason for assuming that the New Europe in industrial, financial or military power will be balanced nationally much differently from the old pre-war Europe. From any of these viewpoints there are after all only three real countries in Europe, and they face us on the Atlantic: England, France and Germany, with Belgium, Luxemburg and Holland forming parts of the same close geographic grouping.

France and Germany More Nearly Self-Contained

There is one very important difference, however, which separates these nations into two groups; and since this difference has serious financial and political consequences, it may be noted here. On the one hand, both France and Germany are essentially self-contained so far as necessary food and clothing supplies are concerned. Their chief imports, except for luxuries which could be cut off in time of war or other urgent necessity, are of certain raw materials destined in large part to be re-exported as manufactured goods. Under these circumstances both have always maintained high protective tariffs on manufactured goods and lower rates or free entry for raw materials. Both could, circumstances necessitating it, close their ports to both imports and exports without actually starving their populations. At present the pressure of debts makes this less and less a possibility; and an export balance is necessary for each.

Great Britain and Belgium, on the other hand, cannot support their populations on home produce. They import

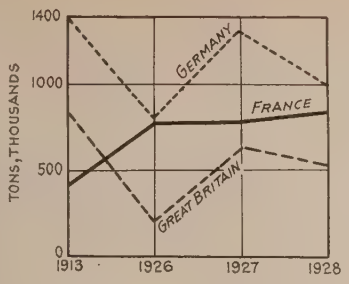

Fig. 3.—Monthly Pig Iron Output of Three Leading European Nations, 1913, 1926, 1927 and 1928. Figures at left are in thousands of metric tons. The important point is the growth of French output

not only raw materials but foodstuffs. So that since a tariff would only raise living costs without doing any good to industry, they have tended toward absolute free trade. At present, in Great Britain, the leaning is toward protection of certain key industries. It is questionable if it can be justified there except as insurance against war.

Under present conditions, of a huge mass of international reparation and debt payments, the differences between these two groups tend to disappear. All four of these countries will have to produce increased amounts of manufactured goods for export; and they will have to do this under pressure for some 60 years. And that is the chief reason for the American industrialist's interest in either debts or reparations. Every politician and every banker in every country has a patented and foolproof method of avoiding this difficulty. It will be of interest to see what happens when they meet cold facts.

Before going on to discuss the coal and iron situation of the separate nations it may clarify that discussion if we precede it by a summary of the leading facts:

Coal and Iron Situation in Summary

COUNTRY	COAL STATUS	IRON ORE STATUS	IRON AND STEEL STATUS
Germany	Coal reserves and output very large; ample for export	Iron ore reserve small; heavy imports necessary	Iron and steel capacity large; heavy exports
Great Britain	Coal reserves and output very large; ample for export. Labor costs high	Large reserve of low grade ore; heavy imports	Iron and steel capacity large; heavy exports
France	Coal reserves small; imports necessary	Enormous reserves; heavy exports	Iron and steel capacity moderate; exports not large
Belgium-Luxemburg	Coal reserves and output small; imports necessary	Iron ore reserves small; output too large; imports desirable	Iron and steel production relatively large; mostly exported
Sweden	No coal	Reserves very large; exports	Small high-grade output
Spain	Very little coal	Moderate reserves, all exported	Non-existent
Russia	Coal reserves moderate; development retarded	Moderate ore reserve	Small but growing industry for local use
Poland	Coal reserves moderate but lack of local use permits relatively heavy exports	Nothing serious	Small
Czechoslovakia	Coal reserves moderate; fully employed locally	Moderate	Relatively intense manufacturing development
Italy	Coal reserve unimportant	Iron reserve slight	Practically zero
Austria	Coal reserve small	Iron reserve moderate	Too great for existing area of the country
Jugoslavia	Coal reserves (mostly lignite) moderate	Small	Very slight

Paris, May, 1929.

[*Concluded in* THE IRON AGE *of July* 18]

Has Made 100,000 Heats of Converter Steel

ON July 1, the 100,000th heat of steel was made in the 3-ton bottom-blown converters of the Taylor-Wharton Iron & Steel Co., High Bridge, N. J. The accompanying reproduction of a photograph shows the two converters. The one on the right has been in service since 1892 and the other since 1917.

The first blow in the older converter was made on Sept. 24, 1892, and the first manganese steel blow on Oct. 29, 1892. This was the tenth blow produced in this converter and is believed to be the first manganese steel made for regular production in this country.

During the nearly 37 years that converter steel has been made at the High Bridge plant there has been regularly produced, in addition to 12 per cent manganese steel and ordinary carbon steel, a considerable tonnage of nickel and nickel-chrome steel for castings, and a number of heats of chrome steel for armor piercing shells for the United States Government. A number of these shells in sizes up to 13 in. were used by the Navy during the Spanish-American War.

In June, 1909, the first steel for castings with manganese of 1.25 per cent was produced at High Bridge and for about seven or eight years thereafter steel of this composition was used for gold dredging buckets. The converters were used also to produce steel for gun carriage castings, powder press cylinders and ship stern frames and rudder posts during the World War.

Welding 26 Miles of Pipe a Day

Use of Automatic Equipment, Both Processing and Conveying, Converts A. O. Smith Plant into a Huge Machine

MAKING pipe-line pipe by electric butt-welding of plates, as done in the A. O. Smith plant, has created an unusual amount of interest. Perhaps still more comment has been caused by the impinging of this new-type pipe upon established lines of supply of pipe made by the conventional fire-welded method. For these reasons the story here, of how that pipe is made, should help to fill the gap in our recording of processes of steel manufacture.

ABOUT 100,000 tons of steel a month is moving by rail and water to Milwaukee, where it is being fabricated by the A. O. Smith Corporation into electrically welded pipe at the rate of 26 miles in 24 hr. The application of the electric arc is in itself an interesting development, but there are also the features of extensive use of automatic conveyors, machines for rigidly testing each length of pipe and the use of special equipment which reduces manual labor to the minimum.

Over a period of many years, this company has acquired extensive experience in the designing of automatic machinery and in the electric arc process of welding. In 1920 the company built an automatic plant for the manufacture of automobile frames [see THE IRON AGE, March 22, 1928, page 794, for description], and for several years it has been electrically welding thick steel plates into pressure vessels for use in the oil-refining industry. Today it is applying this accumulated experience to the manufacture of electrically welded pipe, the output of many miles a day of which is in diameters ranging from 8⅝ in. to 26 in.

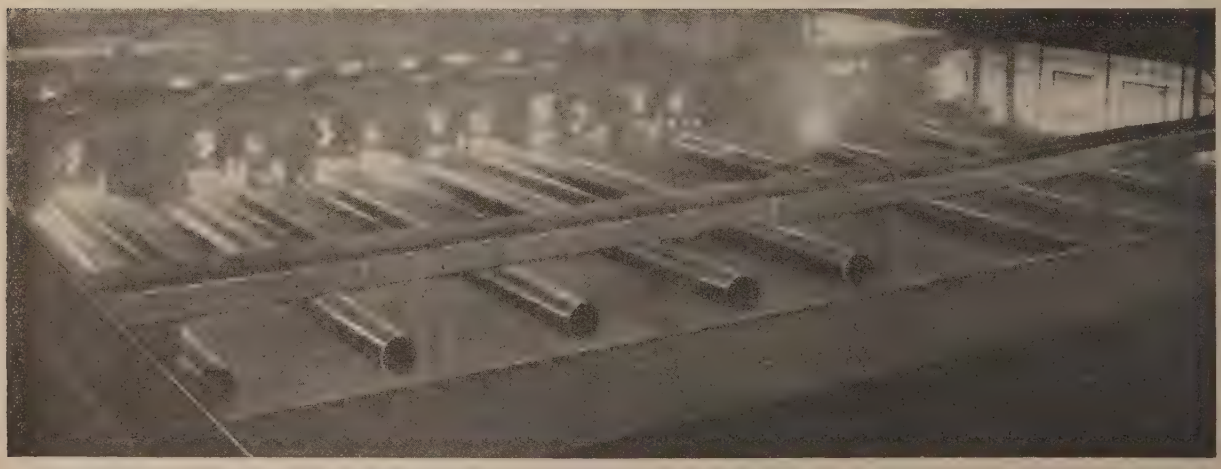
The original pipe plant was conceived, designed and built in the short period of four months and, when put in operation, had a daily production of 6 miles. This later was increased to 10 miles a day. In February of this year a second pipe mill was built, bringing the total output to 26 miles a day. Unit lengths made in the first plant are 30 ft., while the new plant was built for manufacturing units in 40-ft. lengths.

Skelp is bought on rigid specifications and is chemically and physically inspected at the mill as well as at the A. O. Smith Corporation plant before it can enter the production line. The steel most commonly used is 0.20 to 0.30 per cent carbon, having a minimum tensile strength of 60,000 lb. to the sq. in. Thicknesses range from ¼ in. to ½ in., inclusive.

The steel storage yard, 720 ft. long, is traversed by an 80-ft. span overhead electric crane. An inclosed storage building is now under construction, where various sizes of pipe will be held in stock.

Railroad cars, loaded at the mills, are switched beneath the steel yard crane. Skelp removed by the crane may either be deposited in the storage yard or put upon a wide conveyor, which extends from the storage yard into the main building. This conveyor places the material in position for the first operation, which is that of pickling. Here the skelp is picked up in special carriers and put through a pickling and cleaning process by which all mill scale is removed. As the pipe is formed cold, scale is not produced again in the course of manufacture.

After having been prepared for fabrication, the skelp is automatically conveyed to hydraulic presses, where it is formed by a series of operations into cylinders of the required diameter. The cylinders are then moved by conveyors into the automatic electric welding machines. These conveyors run parallel and each one passes through a welding machine, which is under the supervision of an



This Battery of Welding Machines Produces 10 Miles of Pipe in 24 Hr. This is equivalent to 1760 pieces of 30-ft. pipe

SKELP Is Unloaded by Means of a Magnet Equipped Crane. It is moved to the first operation by the conveyor shown in the foreground

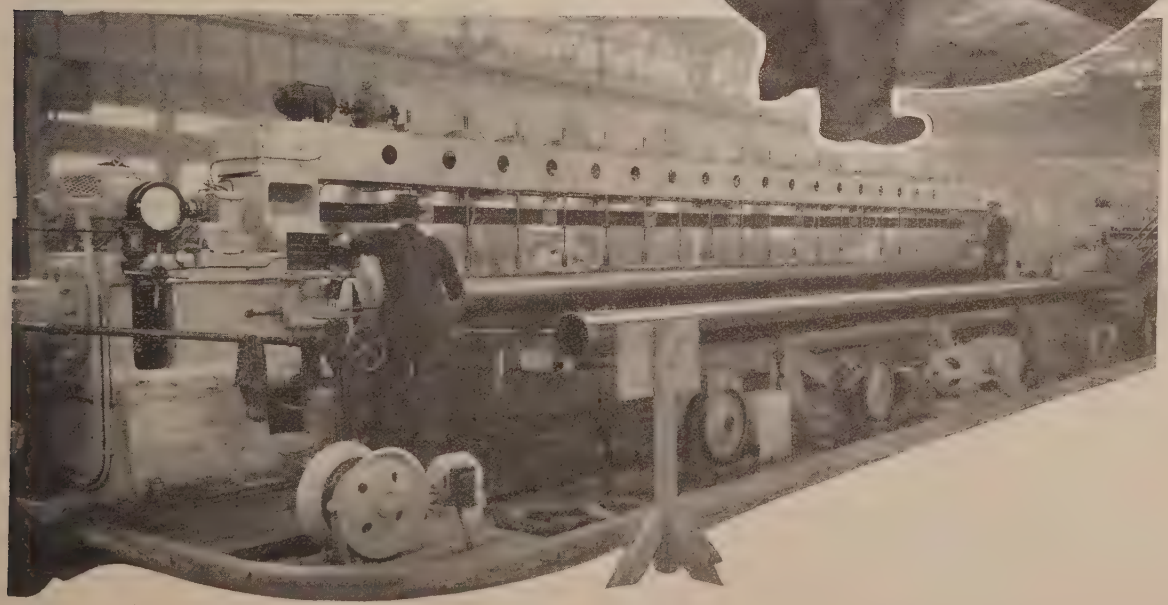
Metal in Each Length of Pipe Is Stressed to 22,000 Lb. to the Sq. In. in this Automatic Hydraulic Testing Machine (Below). Before the pressure is released the weld is hammered by the weights suspended from the overhead member



An Elevated Platform Facilitates Loading Pipe into Gondola Cars. The lengths are raised to the platform by the flight conveyor appearing at left

operator. Close watch is kept on the operation of the machine and the character of the arc, to insure that quality of work which will successfully pass future tests.

Conveyors pick up the pipe at the outgoing end of the welding machines and carry it a short distance laterally to a row of milling machines. Here the welding bead is removed for a short distance at each end, to meet requirements of coupling the joints in the field. If the pipe is to be equipped for bell and spigot joint, one end is expanded cold to form the bell part, and the other end is upset cold so that a bead is thrown up on the outside of the pipe. This bead is valuable, because it assures a positive gage for the correct stabbing distance, and further it forms, with the end of the joining pipe, a well, which facilitates welding in the field.

Hammer Test Is Applied Automatically

It might be well at this point to emphasize that all operations, from pickling to and including welding, are performed in a straight line. The welded cylinders are then transported by a return conveyor to hydraulic testing machines, which stand in a row parallel with this conveyor. The pipe is automatically delivered to each machine, which tests one length at a time. The pressure used is sufficient to produce a stress in the pipe walls of 22,000 lb. to the sq. in. This pressure is held for about 10 sec., during which time the weld is continuously hammered by a series of weights, which are automatically operated and which form an integral part of each testing machine. After the hammer test the pressure is lowered about 50 per cent and the weld is inspected from end to end.

Conveyors Are Timed and Automatically Loaded

After a length of pipe has passed the hydrostatic and hammer tests it is released from the machine and is rolled out on a sloping table, which feeds to a return conveyor. A timing device releases one length at a time and places it on the conveyor. The loading arrangement is timed so that, with all testing machines in operation, one piece of pipe cannot be piled on top of another as it is passing by on the conveyor.

Tested lengths of pipe are fed to a cross conveyor, which forms essentially another link in the chain of inspections that this product must undergo. One of the principal tests made is for roundness. For this, aluminum gages with steel inserts are used; the gages are light in weight and prevent fatigue of the inspectors.

Pipe lengths which have passed all inspection are automatically delivered to a conveyor traveling practically the full length of the shop. One length at a time is placed on this conveyor, which passes through a housing equipped with numerous nozzles for spraying a washing solution over the pipe. This solution is heated and thereby the pipe is warmed so that moisture is quickly evaporated and the pipe is dry before it reaches the paint spray.

The next operation on the line is painting the pipe. The conveyor passes through a housing on the inside of which are mounted paint spray nozzles. Both washing and painting machines are operated by automatic trips, so that the sprays are in action only during the time that a length of pipe is passing through a housing. In other words, the spray is cut off automatically as the trailing end of the pipe passes from its reach. The space between wash and paint housings is so gaged that the pipe is dry, but still warm, when the paint is sprayed on the pipe.

An extension of this conveyor runs past three parallel flight conveyors, which deliver pipe to an elevated platform. Automatic trips are set so that the flight conveyors can be loaded in rotation, or as desired.

The method of loading this pipe into gondola cars is of interest. The load below the level of the car sides is tied in as one unit. Then the load above the car sides is tied in as another unit. Finally, both are tied together, resulting in a single unit that does not shift in transit.

Tests have been made on this pipe in some variety. One of the most interesting was on a 30-ft. length of 16-in. outside diameter pipe with ¼-in. wall thickness. This pipe was first put through rolls to flatten it. with the weld at one edge, where the stress is greatest. This part of the test left the pipe in a hoop-like shape, with the walls pressed together like a deflated inner tube. Heads were welded on the ends and the pipe put under hydraulic pressure. As the pressure was increased the pipe straightened out to within a foot of being perfectly straight, and it came within 3/16 in. of a true circle. The pipe burst at an internal pressure of 1910 lb., producing a stress of 60,800 lb. to the square inch or five times the working pressure.

Willis L. King Finds Sharp Contrasts in His Sixty Years in Iron and Steel

WILLIS L. KING

COMING into the industry only four years after the close of the Civil War, Willis L. King, vice-president of the Jones & Laughlin Steel Corporation, Pittsburgh, has had a longer experience with the ups and downs of iron and steel manufacture in the United States than any of his contemporaries. In July, 1869, at the age of 18, he entered the employ of the firm of Jones & Laughlin, so that the present month marks the completion of 60 years of continuous connection with an interest that has long been named among the three or four leading producers of American steel. Only four years before 1869 was the first "blow" of Bessemer steel made at the famous Troy works, and 15 years passed before the production of Bessemer ingots had climbed to a million tons.

Most important of the changes that have come in Mr. King's long career—one that was fairly revolutionary in the case of his own company—was the practical abandonment of the manufacture of finished iron and the substitution of steel for all rolled products. In the case of the Jones & Laughlin company this has meant an advance from an output of 100 tons of iron a day to more than 10,000 tons of steel ingots daily. For many years Mr. King has been a prominent figure in the councils of the industry, particularly so since the death of B. F. Jones, head of the Jones & Laughlin company, in 1903, following Mr. Jones' long service as president of the American Iron and Steel Association. Since the organization of the American Iron and Steel Institute in 1908, Mr. King has been one of its directors and for most of the interval one of its vice-presidents. Within the past year he was made its honorary vice-president.

With the thought of marking the very unusual anniversary of this month, THE IRON AGE asked Mr. King for an expression concerning the contrasts between 1869 and 1929. We are gratified in presenting below his reply, which adds another to his valuable reminiscences of an eventful period in our iron and steel history:

Mr. A. I. Findley,
Editor THE IRON AGE, *New York.*

DEAR SIR:—I have received your letter of June 20, suggesting that I set down for THE IRON AGE some recollections of my long connection with the iron and steel industry and opinions as to its future. If a brief summary will suffice, I am glad to comply.

100 Tons of Iron Daily, 60 Years Ago

I have been permitted to live in the most interesting period of the metal industry, having participated in the later years of the iron era, having seen the beginning of the age of steel, and having had a modest part in its wonderful development. The most impressive fact of all to me is the amazing growth of steel production.

Having no statistics at hand of the increase in iron and steel over this long period, I may be pardoned, perhaps, for want of a better comparison, in referring to Jones & Laughlin, then a partnership, as typical iron manufacturers, who started operations in 1852, and when I came to them in 1869 made 100 tons of iron per day, and at that were among the largest producers. They changed from iron to steel in 1882, and are now making over 10,000 tons of steel ingots daily. Only our great country, rich in everything material to the progress and well-being of its people, could have made such results possible.

Contrasted Eras

It may be interesting to compare the men and the times. There were no facilities then for communication except limited mail and telegraph service. Letters were hand-written, and banks could not always discount customers' notes, which caused many failures. Competition was severe, not voluntary so much as a necessity for running mills to secure payrolls. Yet, with all their handicaps, the manufacturers were able to supply the limited wants of the time in iron. No great fortunes were made. Mr. Carnegie's star arose after he commenced the manufacture of steel, and he was no more prominent than some others in the iron industry. He was the first to see the coming of steel as a substitute for iron; he had the courage to make vast expenditures, for those days, in building his steel plant, and was fully entitled to the fame and fortune he received. Other prominent iron manufacturers, more conservative, followed him into steel later, and the era of steel was well under way in 1890, in which year 4,277,000 tons of steel ingots were produced. Last year 51,544,000 tons were produced, and at the rate of production over the first six months of this year 58,000,000 tons may be reached in 1929.

Time, perhaps, has cast a glamour over the men of those early days; but it seems to me they had much more than average ability. They were the owners of their properties and had a greater incentive for success. There were not a few outstanding men of unusual force and vision, whose talents would have made them successful as chief executives in the big and strenuous business of today.

New Forces in Selling and in Transport

In looking back I am impressed by the fact that, as business increased, facilities kept pace with its necessities, and always at a time when most needed. History is repeating itself, for at this flood time of business we have two new major agencies which will greatly increase efficiency in operation, merchandising and distribution. One is the recent trade associations, of which many hundreds have been authorized by the Federal Trade Commission, to be guided by the reasonable interpretation of the anti-trust laws by the Supreme Court, which seems to encourage reputable business in cooperation rather than punish it; but they must keep within bounds. The other is the completion of the canalization of numerous rivers, notably the great Ohio and its tributaries. Over 1000 miles from its headwaters at Pittsburgh to Cairo, here is a broad all-the-year waterway through the Mississippi to New Orleans and the Gulf ports. Our corporation has practically had full use of the river for over two years, sending out at intervals tows of 8000 to 10,000 tons of various steel products, although the 53d lock above Cairo has not been entirely completed until recently.

Outlook Highly Favorable

Time has solved many of the troubles of the industry. The money shortage of early days has long passed. A

more recent cause of friction, the question of contract obligations, has been in great part settled by the "hand-to-mouth" buying of the last few years and the nice balance between production and consumption. Overproduction seems have been inherent in the industry from early days, and that trouble, I fear, is ahead of the industry, unless extensions and improvements are kept within reasonable limits. But the natural growth of the country will require more steel; new uses will be found; the railroads, building trades and automobile makers will still be large consumers, and overproduction cannot affect the nearby future. The country is prosperity-minded, and only a great shock can disturb its optimism. Conditions seem to be as ideal as we can ever hope for, and the year 1929 will, I believe, hold the record in tonnage and profits.

Yours very truly,

WILLIS L. KING.

Pittsburgh, July 5.

Hardening Copper and Outdoing the Ancients

AN editorial in THE IRON AGE of June 20 on "Tempering Copper" called attention to the futility of the efforts to which so much attenion is given at intervals in the daily press to rediscover the "lost art of making copper as hard as steel." As no reference was made in the article to what modern metallurgy has done in copper hardening, we give space below to a leaflet on the subject, issued as No. 7, Vol. 7 of "Research Narratives" by the United Engineering Society for its Engineering Foundation. The author is William G. Schneider, research department, Copper and Brass Research Association, 25 Broadway, New York:

"Hardened Copper—A Recovered Art"

"There exists, on the part of those not intimately connected with the working of copper, a belief that the ancients had a method of hardening that metal, with which art we today are not familiar. The fact of the matter is that our present-day metallurgists not only understand how the ancients hardened their copper and bronze, but also know how to produce copper and bronze products that are even harder than those left to us and which represent the evidence of the so-called lost art of hardening copper.

"Cutting edges developed on swords, daggers, knives and other implements by the ancients were obtained by hammering the metal, or in other words cold working. Those old metal workers not only hand hammered their copper implements but also used the same means to harden their bronze articles. The heating of many of these products in open fires resulted in the formation of considerable copper oxide, which alloyed with the copper and hardened it. One of the most common mistakes of persons claiming to have rediscovered 'the lost art of hardening copper' is to heat it in a forge and in this way saturate it with copper oxide, which combines with the copper to form a much harder and much more brittle product.

Two Methods—Alloying and Cold Working

"There are really two methods of hardening copper that are regularly practiced nowadays, just as centuries ago. One consists in alloying the copper with some other metal or several other metals such as zinc, tin, nickel, cadmium, chromium, cobalt, silicon, aluminum, iron, beryllium and arsenic. The second method consists in cold working the metal or copper alloy. In fact, it is possible to work the metal to such a stage of hardness that a slight amount of additional work will cause it to break. The explanation of all copper hardening may be attributed to one of these methods or a combination of them. Microphotographs of an ancient copper spearhead indicated that it was extremely hard and that apparently this hardness had been obtained by cold working the metal.

"Copper scissors, knives and other cutting tools may be obtained. Unless, however, a special reason exists for their use, they offer no advantages over tools made from steel. Occasionally, however, it becomes necessary to use copper or bronze tools, such as knives. Around a powder plant, for instance, where all sparks must be avoided, bronze knives are almost essential.

No Comparison with Steel

"The actual hardness of annealed commercial copper as determined by the Brinell machine is from 40 to 50. The hardness of cold-worked pure copper probably does not ever exceed 120 Brinell. The hardness of copper that has been alloyed with some other metal or a number of metals rarely exceeds 250 Brinell, although a hardness just over 300 has been attained as an upper limit. As a basis of comparison for readers unfamiliar with measurements of the hardness of metals, it may be stated that the Brinell hardness of very 'soft' iron is around 80 and of steel used in common cutlery, such as in a finished pocket knife, about 420 Brinell.

"Not only do many persons spend a short while endeavoring to rediscover an art that never was lost, but some of them devote a whole lifetime to this effort. The tragedy, or rather the denouement, occurs when they have evolved a hard copper. They next endeavor to find some use for it and then learn that, unless it has some special properties, no market exists. Copper wire, hard drawn, has a tensile strength of about 65,000 lb. per sq. in. and an elongation in 10 in. of about 1 per cent, with a conductivity of about 97 per cent. This affords some basis on which to work when endeavoring to develop the hardening of copper. If, for example, it were possible to harden copper so that the tensile strength were materially increased above that just stated, without reducing the conductivity, a worthwhile discovery would have been made.

"Some recent methods of hardening copper by alloying have, to a certain extent, come about as near to actually 'tempering' copper as would seem possible. In these methods the metal silicon plays a most important part because it forms silicides with other metals which in turn form eutectics with the copper. The deoxidizing effect that silicon by itself exerts plays no unimportant part in finally allowing the metal to be worked and by heat treatment to develop a high strength, with a relatively high conductivity. This latter, however, is considerably below that of pure copper and second only, speaking of alloys from the standpoint of both strength and conductivity, to those of copper and cadmium. Alloys of copper with cadmium give, for a stated conductivity, higher strengths than those with silicon."

A program of eight research studies in coal mining and metallurgy will be carried on during the year 1929-30, under the joint auspices of the United States Bureau of Mines, the Carnegie Institute of Technology, and Mining and Metallurgical Advisory Boards composed of mining and metallurgical engineers and executives, it is announced. Eight college graduates have been appointed to research fellowships to make the investigations.

German Foundrymen Meet in Berlin

Committees Active in Many Fields—Suggestions to Improve Electric Furnace Operation—Calory Consumption for Foundry Labor

IN his presidential address before the annual convention of the German Foundry Engineers' Association, held in Berlin, May 24 to 26, Dr. C. Humperdinck, director of the Bruderus Works, Wetzlar, welcomed the 400 delegates coming from all parts of Germany, Austria, Hungary and other countries to the twentieth annual gathering of the association. He emphasized the continued interest in the spirit of research which was accomplishing so much for the good of the industry, and deplored the carelessness with which money is spent for all kinds of purposes in spite of the heavy loads nations have to carry since the cataclysm of the war. This is disastrous to the foundry where the penny must be watched most carefully.

It is the duty of foundry engineers, said the president, to work continually for the recognition of economic requirements in industry, as also in the political progress of the world, and not be swept along with the tide of the times. The time will come when manufacturers can no longer equalize mounting costs with mechanical improvements, and this will react on the ability to market the product. Further, when socialistic endeavor by the state gets to supersede private initiative and the striving for individual profit, these so necessary factors in the prosperity of a country will be crippled and eventually lost. Unless, therefore, an entire realinement of ideas takes place in the near future, the outlook is black and disaster, unemployment and the bread-line are bound to come.

Secretary F. Bock, in his annual report, stated that employment conditions are a little better than last year, but still very bad, as many foundry engineers are unable to find places. Much activity has prevailed in research, this being carried on chiefly by standing committees. The molding sands of Germany are being investigated by one committee, another one has just presented a final report on the number and capacities of arc-electric furnaces. Also there is ready to publish a bibliography of the electric furnace. Another committee is making a series of investigations on high-test cast iron, while other committees are working with brass, bronze and aluminum alloys.

Much attention is being given the subject of the technological education of engineers for the foundry, the final agreement being to have all the societies and trade associations, which are interested, work through the sponsorship of the respective committee of the German Iron and Steel Institute. An investigation is being made on the desirable chemical and physical constitution of foundry coke for melting purposes. Also, there has been taken up the study of alloy additions to cast iron. Apprentice training and cost accounting in connection with the steel, malleable, gray iron and non-ferrous fields complete the program of work being done and still ahead. Much of this is intended to be spread about through courses of lectures and class-room studies.

In connection with the series of papers read at the sessions, the following has been abstracted*:

Improvements in Electric Furnace Practice

K. von Kerpele of Roumania discussed the subject of "Quality in the Electric Steel Foundry." He described a small steel foundry pouring ingots for making steel wire. The entire hearth and walls of the furnace are of standard magnesia brick, the roof being of silica brick. The hearth itself consists of three layers of the brick and a dry-rolled bath bottom on top. This method served better than the usual rammed-up bottom, 20 per cent of patching material being saved in regular operation. At the right of the tapping spout, in the second course of brick, there is left a slit, or opening, 2¾ in. square, to allow a very slight air intake which, coursing under the roof, effectually prevents dripping of the brick. The roof lasts 80 to 90 charges, the period of refining being 2 hr. Consumption of Acheson-Graphite electrodes is 15.4 lb. per 1000 kwhr. Ferrotitanium additions result in high-quality steel. Melting is very hot, pouring slow.

Calories Involved in Foundry Labor

A very odd and interesting paper was read by G. Stern of Frankfort on the "Demand Upon the Operative in Performing Separate Pieces of Work." Mr. Stern has visited the United States and studied production methods. After classifying the steps incident to world-wide production and distribution of castings, he narrows down to a dissection of the slogan "Power-Saving with Profit-Increase," holding that it is necessary, in studying the production of an operative within a given time period, to include the actual consumption of calories, or other units, in this production.

A labor-physiologist, Dr. Simonson, undertook to measure the calories involved in a labor-effort by gaging the consumption of oxygen of the man during the period, as well as getting the carbon dioxide discharged. These figures were obtained for ramming up sand in a mold by hand, by squeezer-press, and by the hydraulic press. Thus, actual figures were obtained showing the great gains in production for the same effort by changing the type of machine for greater efficiency.

Calories Expended Per Mold

In the above example, per mold made, the calories expended were respectively 11,479, 9569 and 5820. On the other hand, the time element comes in also, for the expenditures of calories per minute to obtain this great gain in results were respectively 4049, 5110 and 5640, or an increase. The results brought to parts of a mold per minute, respectively, were 0.353, 0.518 and 0.978. It would follow that it is desirable not only to save time by normalizing mechanical practice, but also to reduce the effort expended per minute without, however, reducing the production intensity.

Tabulating these studies of calory consumption for the separate motions or operations will show the desirability of doing away with operations involving a high expenditure of calories to save the men. These expensive-effort operations are usually connected with work extraneous to the actual objective. Thus, in making a mold, there is the movement of flask parts, shoveling sand, striking off, etc., much of which can be obviated by the designer of molding machinery who knows his business. Easing the labor in squeezing the mold by effective mechanical arrangement, etc., all intended to save the man while increasing his production, should be the watchword of advancing civilization.

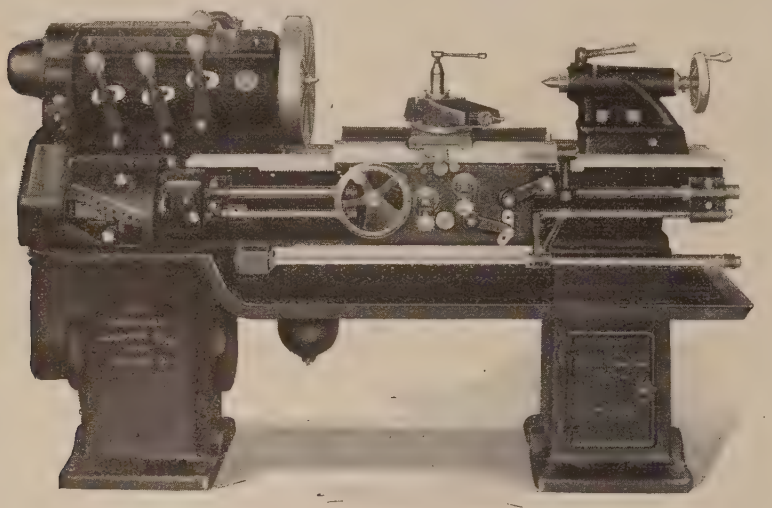
*By Dr. Richard Moldenke, Watchung, N. J.

Designs Lathe for Tungsten Carbide Cutting Tools

TO meet the demand for lathes that will operate smoothly and quietly at much higher than the usual spindle speeds, the Monarch Machine Tool Co., Sidney, Ohio, has brought out a new line. Sizes range from 14 to 36 in. swing, and spindle speeds from 600 to 1500 r.p.m. The machines are said to meet the specifications drawn by research engineers for obtaining the best results with Carboloy, Widia and other tungsten-carbide cutting tools.

Helical gears and Timken roller bearings, features of previous Monarch lathes, supply two main essentials for the higher spindle speeds, and therefore only moderate changes were necessary to adapt them for the tungsten-carbide tools. It is said that work may be turned at speeds never before attempted with high-speed steel tools, and even at top speed no vibration or gear tooth marks are shown. Cast iron is being machined at from 500 to 700 ft. per min. and other materials at corresponding speeds. The new machines may be used economically also at the slower speeds necessary for steel tools.

Tests are said to show that to secure maximum results with the new tungsten-carbide cutting tools, at least twice the power is required as for a lathe designed to use high-speed steel tools, this being due to the much greater amount of metal removed in a given time.

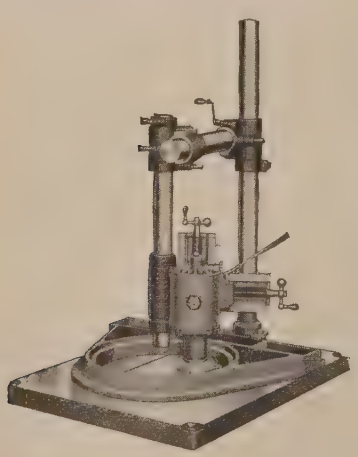


Helical Gears and Tapered Roller Bearings Are Among the Features Adapting the Lathe for Use at Speeds Up to 1500 R.P.M.

Grinder for Surfacing Die Blocks and Other Work

FOR surfacing die blocks, grinding manholes and flat work within a minimum circumference of 24 in. the United States Electrical Tool Co., Cincinnati, has designed the special electric grinder here illustrated. The drive is by a 2-hp. Westinghouse motor running on SKF ball bearings, the lower bearing being of combination radial and thrust type. The surface of the base, which is machined true, is 36 x 48 in. The T-slots provided for clamping down work start from the rear and extend about three-fourths of the distance across the base.

The upright column is made from 3½-in. steel tubing and is 48 in. high. The upright is equipped with a stop collar. The cross arm, also of 3½-in. steel tubing, is 36 in. long. The arm holding the grinder is 3-in. diameter cold rolled steel and the grinder mounting collar is equipped top and bottom with ball bearings. The mounting has two adjustments, 6-in. vertical and 8-in. horizontal. The dovetail slides have adjustable gibs. The machine is regularly equipped with a 6-in. cup wheel and 12 ft. of rubber covered cable with attachment plug.

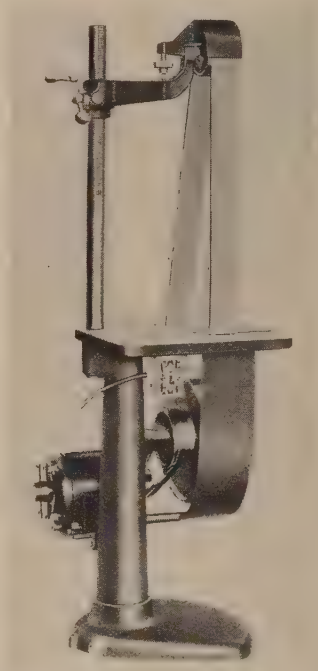


The Grinder Mounting Is Adjustable 6-In. Vertically and 8-In. Horizontally

Irregular Belt Sander and Grinder

A PORTABLE motor-driven sander and grinder weighing 265 lb. net is being put out by the Porter-Cable Machine Co., Syracuse, N. Y. This machine, as shown in the illustration, has a table 13 by 19 in., which is 33¾ in. from the floor. It uses belts ½ to 3 in. in width and with lengths of 95 to 125 in.

Abrasive belt speed is either 1975 ft. a minute for wood or 3425 ft. a minute for metal. Power is transmitted from the motor to the drive pulley by a belt. This fact, together with the rubber covering on the pulleys over which the abrasive band travels, insures quiet operation.



Metal or Wooden Pieces of Irregular Shape May Be Sanded Conveniently

Overall dimensions are 22 by 27 in. by 65¾ in. high. A motor of ½ hp., with ball bearings, is standard equipment.

Safe Practices in Handling Material

A pamphlet of 12 pages devoted to handling material with mechanical equipment has been published by the National Safety Council, 108 East Ohio Street, Chicago. This is called "Safe Practices Pamphlet No. 55." It is a compilation of experiences in accident prevention and is largely illustrated. It follows a previous pamphlet on handling materials by hand and by truck. Many types of equipment are shown in use, and the possibilities of danger in connection with this equipment are pointed out.

Lapping Soft and Hardened Gears

Carborundum Brand Compounds Developed for Variety of Conditions—Methods of Application Described

BY H. J. WILLS*

LAPPING is an important operation wherever quiet and smooth running gears are essential. It removes cutter marks, imperfections in tooth profile and spacing, and corrects distortions caused by heat treatment. Many gears formerly scrapped because of minor surface imperfections are now reclaimed by the lapping process.

Soft metallic gears are usually mounted on an arbor between the centers of a lapping machine having adjustments for varying the mesh of the gears. Because of their comparatively small diameters, hardened steel gears are usually mounted on a lathe and lapped on centers only. If the lapping machine equipment has adjustments for varying the mesh of the gears, it is recommended that the gears be lapped in all three positions, that is, on close, wide and on running centers.

Carborundum brand finishing compound should be applied with a paint brush after the gear has been mounted and is in motion. Sufficient compound should be used to wet the entire surface of the gear teeth and in the case of very large gears, the surface of the teeth should be moistened with kerosene or machine oil before applying the compound. Best results are obtained if the gears are lapped under light load and at speeds that will not cause the compound to fly, a speed just below the point where the compound would be thrown from the gears being the most desirable. Frequent examination of the lapping action is necessary on the first gears lapped in order to determine the time required to obtain the desired results.

Successful operation of any compound depends a great deal upon selection of the proper grading for each specific class of work. For the lapping of soft metallic gears, Carborundum brand finishing compound in WL5-4 coarse, WO5-4 medium or WR5-4 fine, depending on the size and condition of the gears, may be used. For exceptionally high finish, the grading HX2-40 is recommended.

For the lapping of hardened steel gears, the RL4-4 grading may be used for a fast cut on rough gears, but where the gears are small and smooth finish essential, a special and finer grade, the RT4-4 has been developed. For hardened steel gears lapped in with soft metallic companion gears, the compound recommended for soft gears should be applied.

Lapping of worms and wormwheels is one of the simplest of all gear lapping processes. When lapping worms only, the worm is mounted between centers on a driven spindle. A cast-iron, brass or micarta lap made to the same form as the companion worm-wheel is mounted on a two-way carriage and after pressing the lap firmly into the worm threads, the machine is started and the compound applied with a brush while the lap traverses the worm once in each direction the full length of the threads. Worms up to about 2 in. in diameter are lapped by this method in from 5 to 10 sec. The most suitable grade of Carborundum brand compound for the larger diameters is the RT4-4; for the smaller worms the grading RU4-9 is more efficient. Where tool marks are deep, regardless of the diameter of the worm, the grading RS4-9, which is a faster cutting compound, is the most satisfactory.

When lapping worms and wormwheels simultaneously, the machine set-up is the same as in lapping worms only, except that the wormwheel takes the place of the manufactured lap. The grading WR5-4 is usually suitable for this operation unless a coarser grading is required, when the WO5-4 grading is recommended.

The foregoing methods apply to lapping on a production basis. Where production is small and more or less intermittent, or where lapping machine equipment is not available, the worms and gears can be assembled and lapped in their housings. If this method is employed, the compound should be applied sparingly so that it will not flow or drip into the bearings or housings.

Although the abrasive content in the compound does not charge or impregnate the metal, the parts should be thoroughly cleaned after lapping to remove any loose particles of abrasive. This cleansing is best accomplished by brushing or spraying the gears either with kerosene or hot water.

*Engineer, Carborundum Co., Niagara Falls, N. Y.

New ¼-Ton Electric Hoist

A YALE ¼-ton electric hoist, providing rapid and safe handling for lifting light loads, has been added to the line of the Yale & Towne Mfg. Co., Stamford, Conn. Suspension is structural steel plate arranged for either hook or trolley type of hoist. The trolley is adjustable to fit I-beams from 4 in. to 9 in. The hoist has been designed to operate where space is limited and close headroom is required.

Trolley wheels are made of pressed steel and are mounted on ball bearings. Zerk fittings are provided, for grease lubrication. The fully inclosed motor has ball bearings. As a. c. and d. c. motors are built to the same dimensions, they are interchangeable on the hoist frame. The motor has a magnetic brake to stop the machine quickly, and prevent coasting when the current is shut off.

This hoist can be furnished in either the manual or push-button type. Controllers are ruggedly constructed and all parts are accessible. A planetary gear reduction is used, operating in oil in a fully inclosed housing. The chain drive from the motor to the sprocket and all the lowering brake parts are fully inclosed in a housing and operate in oil.

The load sheave is a bronzed bushed, electric steel casting, turned and ground to concentricity for the large chrome-vanadium steel bearing races. The driving pinion that passes through the load sheave is machined from a single drop forging, then heat-treated, with the bearing surfaces on the shaft ground to 0.001 in.

An automatic stop mechanically connected with the controller shuts off the power when the upper or lower limit of hook travel is reached. The brakes are immediately applied and hoist brought to a stop.

STRUCTURAL Steel Plate Forms the Suspension Member of the New Low-Head Hoist Illustrated. Limit stops provide for safety

Proportional Freight Rates Allowed

Interstate Commerce Commission Approves Tariffs Giving Lower Rail-and-Water Rates to Southwest

WASHINGTON, July 9.—The Interstate Commerce Commission this afternoon decided not to suspend the proportional rates on iron and steel products proposed by the Pennsylvania Railroad and the Central Freight Association territory railroads. The tariffs will become effective July 10.

Protests were made by the Chicago Association of Commerce, in behalf of Chicago iron and steel producers; by the Youngstown Chamber of Commerce, in behalf of steel companies in that district, and by the Bethlehem Steel Corporation.

By this decision, steel companies at McKeesport, Pa., and Bessemer, Pa., Depew, N. Y., and at other points in or very near to the Pittsburgh and Buffalo steel-producing districts will be able to ship their products to the Southwest at rail-and-water rates via the Mallory, Morgan and Southern steamship lines and their connections in the Southwest. These tariffs have been in effect since Feb. 21, 1928, but the rates have not applied from the points which now are to receive this benefit.

Tariffs filed by the ocean lines and their Southwestern connections make rates from some middle steel district points to the Southwest on the basis of the ocean lines absorbing the local rates of the Eastern railroads to the North Atlantic ports. For example, they publish a rate of 74c. on wrought pipe from McKeesport, Pa., to Dallas, Tex. The local rate on pipe from McKeesport to New York is 34c. a 100 lb. The ocean-and-rail lines stand the cost of getting the pipe to the port, including lighterage, or other service, if any. They have left for themselves 40c. a 100 lb.

While McKeesport and Bessemer, Pa., are in the Pittsburgh rate district and the rate to New York is the same as the rate from Pittsburgh, Pittsburgh is not one of the points from which the ocean-and-rail rates apply. If the Pittsburgh steel company desires to use the ocean-and-rail rate to the Southwest, it must pay to get its steel to New York.

To overcome the handicap caused by that situation, the Pennsylvania proposed a proportional rate, applicable only on traffic going beyond McKeesport, of 10c. a net ton. In that way the Pittsburgh shipper will be able to get to Dallas on a 74.5 cent rate or only ½c. higher than the McKeesport shipper.

From Youngstown it is proposed to establish a proportional rate of 3.5c., which is exactly the difference between the local rates from Youngstown and McKeesport to New York. From Cleveland to McKeesport the proportional rate named in the tariffs is 6c. a 100 lb.

By means of these proportional rates the railroads serving mill points other than those named in the ocean-and-rail tariffs propose to put those points on an equality with McKeesport, Bessemer and other points from which the ocean carriers have published the rates.

In every instance the Eastern railroads, under the proposed rates, will collect all or more than their local rates to the ports. Youngstown will get into Dallas, for instance, on a rate of 77.5c. on pipe. At present Youngstown, if it ships pipe to Dallas, must pay a local rate of 11c. to McKeesport, plus the 74c. ocean-and-rail rate from that point.

This sort of an adjustment is to apply from all the eastern Ohio, western Pennsylvania and New York and northern West Virginia mill ports to all the North Atlantic ports via which the ocean-and-rail routes and rates are in operation, subject to the customary port differential adjustment.

The Chicago Association of Commerce, in its petition, said, it spoke for the Acme Steel Co., Clayton Mark & Co., Inland Steel Co. and the Interstate Iron and Steel Co. They ship on all-rail rates to the Southwest. The proportionals will increase the area from which competition with them in the Southwest will come. The Bethlehem corporation protested on account of the increased competition brought about in the way indicated.

Canadian Output of Iron and Steel Products Increased

TORONTO, ONT., July 9.—Iron and steel products manufactured in Canada during 1928 were valued at $607,731,226, or $82,000,000 above the total for 1927, according to preliminary statistics issued by the Dominion Bureau of Statistics. The estimate is based on reports from 1163 manufacturing establishments. Fixed and operating capital reported by these concerns totaled $721,454,764, employees numbered 118,869, salaries and wages totaled $166,837,357, materials cost $306,764,663 and value added by manufacturing was $300,966,563. In 1927, the number of plants was 1148, capital was $638,914,893, number of employees was 106,293 and materials cost $261,102,679. Plants in the iron and steel industry are classified in 13 industrial groups, arranged according to principal products. Twelve of these groups had a higher output in 1928 than in the previous year.

Imports into Canada of iron and steel products during 1928 were valued at $322,959,144, compared with $248,151,554 in 1927. Over 91 per cent, or $295,114,281, of the imports in this class came from the United States and about 5 per cent, or $17,762,561, from the United Kingdom.

Canadian exports of iron and steel in 1928 reached a value of $70,665,677, as against $67,831,374 in 1927. The principal countries to which Canada exported iron and steel goods in 1928 were: United States, $9,216,896; United Kingdom, $8,416,250; Argentina, $6,784,262; Australia, $7,387,236; British India, $6,377,739; New Zealand, $5,421,763; Brazil, $3,162,412; British South Africa, $2,953,139; British East Indies, Chile, Germany and Dutch East Indies, over $1,000,000 each. In addition to the above, foreign iron and steel products reexported from Canada during 1928 was valued at $4,164,254, compared with $3,113,235 in 1927. Of this year's total, $3,952,464 went to the United States and $117,318 to the United Kingdom.

New Company to Build Long Gas Lines

The Central States Natural Gas Co. has been incorporated under the laws of Delaware for the purpose of building a pipe line for natural gas from the Texas Panhandle to Chicago, as well as to other cities en route. This corporation will acquire the natural gas rights and natural gas wells on 132,000 acres of land in the Texas Panhandle from the Texas, Phillips, Skelly and Columbian Carbon companies. It is also reported that the same interests have in mind the construction of a natural gas pipe line from the Texas Panhandle to points in Nebraska, Iowa and other areas.

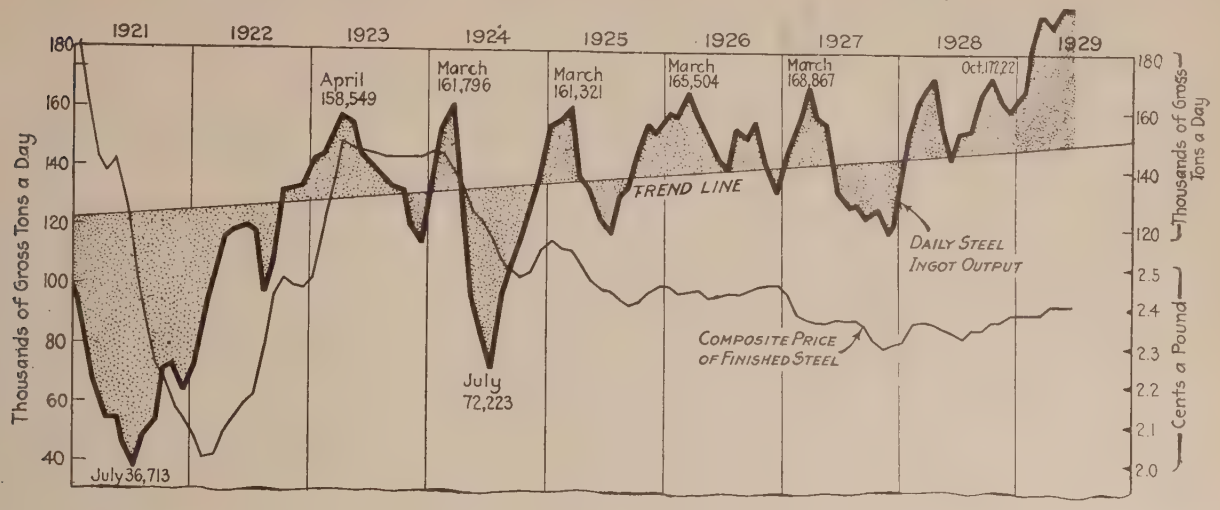
Directors of the Central States Natural Gas Co., will be R. C. Holmes, president, Texas Co.; R. Ogarrio, vice-president, Texas Co.; Frank Phillips, president, Phillips Petroleum Co.; W. G. Skelly, president, Skelly Oil Co., and Reid L. Carr, secretary, Columbian Carbon Co.

Imports British Airplane and Axle Tubing

Aeronautical tubing, including the streamline, round, oval, crescent, cowl ring, letter D, square, hexagon and other sections, made by the Reynolds Tube Co., Ltd., Birmingham, England, can now be obtained from A. Milne & Co., 745 Washington Street, New York. According to H. S. Hoyt, of the Milne company, who recently returned from a trip to England, the tubing is available under United States Government specifications, and that axle tubes, taper gage tubes and other products of the Reynolds company are included in the American representation arranged by Mr. Hoyt.

Civil service examinations for physicist, $3,800 a year, associate physicist, $3,200, and assistant physicist, $2,600, for Government Bureaus are announced. Applications must be on file not later than Aug. 14 with the United States Civil Service Commission, Washington.

Ingot Production in June Held Closely to the Record-Breaking Daily Rate of May. The trend line shows a normal growth of about 1,013,000 tons a year. Prices in June were 3 per cent better than at midyear of 1928



Record Half-Year in Steel Ingots

June Production Brings Total Close to 29,000,000 Tons—Four Successive Months Each Higher Than Any Month in Any Preceding Year

WHILE production of steel ingots in June showed a drop of almost 400,000 tons from the record-breaking total of May, it represented nevertheless the largest month's tonnage, by more than 200,000 tons, which had ever been achieved previous to last March. On the daily basis, the May record of 195,302 tons for each of the 27 working days of the month was almost precisely equalled with 195,255 tons daily for 25 days in June.

Open-hearth production in June fell off 9 per cent from that of May. Bessemer production fell off 12 per cent from the highest Bessemer tonnage which had been made in many months.

For the first half of the year the calculated monthly output, as reported by the American Iron and Steel Institute, was 28,967,174 gross tons. This is 17 per cent ahead of the 24,798,073 tons for the first half of last year, which was the largest first half ever before reached. The current tonnage is almost 4,000,000 tons ahead of the 25,067,122 tons of the second half of 1928, which was the largest half-year's tonnage previous to the present.

All of these figures relate to open-hearth and Bessemer ingots only, as electric and crucible steel ingots are no longer reported monthly by the Institute. Ingots of those two types of steel amounted to 460,208 tons in 1928. This works out at an average of about 1480 tons a day. A figure of some such magnitude would have to be added to each of the recent daily averages to obtain the total outpouring of steel ingots from American furnaces.

For a full year, July 1, 1928, to June 30, 1929, production of Bessemer and open-hearth ingots has been 54,034,296 gross tons. This figure may be compared with 49,865,185 tons, the record-breaking tonnage of the calendar year 1928. The advance, allowing for one less working day in the current figures, is 8.7 per cent.

Particulars for the past 18 months are shown in the table. The diagram traces the course of ingot production and finished steel prices over the past 8½ years.

PRODUCTION OF OPEN-HEARTH AND BESSEMER STEEL INGOTS
(GROSS TONS)

1928 Months	Reported by Companies Which Made 94.51 Per Cent of the Steel Ingots in 1928		Calculated Monthly Output All Companies	No. of Working Days	Approximate Daily Output All Companies
	Open-Hearth	Bessemer			
January	3,273,294	498,691	3,990,902	26	153,496

March	4,183,869	596,691	5,058,258	26	194,548
April	4,026,576	640,351	4,938,025	26	189,924
May	4,276,186	707,484	5,273,167	27	195,302
June	3,990,798	622,585	4,881,370	25	195,255
Six months	23,770,871	3,606,006	28,967,174	155	186,885

Orders for steel building products received by the Truscon Steel Co., Youngstown, Ohio, during the first six months of 1929 were 33 per cent greater than in the same period last year. A considerable percentage of the tonnage was for material for airplane hangars, such as doors, windows, roofs, floodlight towers, reinforcing steel and complete hangars.

Staccato Touches on Industrial Economics

Paragraphic Review of Address to Salesmen By President Roy C. McKenna

OFFERING it as an industrialist's view of economics, Roy C. McKenna, president Vanadium-Alloys Steel Co. and the Colonial Steel Co., made an extended address to a joint sales convention of the two companies held June 27 and 28. Following are high lights of the address:

Our credit system should become more flexible, and capable of taking care of consumer needs. Instalment selling is a step in this direction, and when applied to suitable commodities, and used with sound business sense, it is desirable.

I do not believe that our present system of payment by wages is infallible or final. It is only a step from serfdom and slavery to a more enlightened system of compensation that will be worked out from generation to generation. In America practically all corporations, large or small, welcome the public, and particularly employees, as stockholders. Generally speaking, most employees are capitalists to the extent that they are stockholders; and almost without exception every capitalist is also a worker. The management of industry is more and more coming into the hands of experts, men who themselves are not large stockholders, and cannot be considered as owners. These men value the good opinion of their fellow-workers and associates as much, if not more, than that of the stockholders.

Labor is being more and more treated as overhead, and capital is being treated less and less as overhead. The tendency is toward labor employing capital rather than capital employing labor. This trend shows up in new financing, for when additional money is needed it is more often secured by the sale of equity stock rather than by the issuing of bonds.

Education enables labor to change more easily from job to job as conditions demand. We must continue to give our boys and girls the best of education at the minimum of individual expense. Much of labor that is unemployed is really nonemployable.

Mass production must be accompanied by mass consumption, and mass consumption is attainable only by intensive salesmanship. Yet intensive salesmanship and mass production are incompatible. Mass production implies simplification and standardization. Intensive salesmanship demands that the whims and fancies of the buyer must be met and that changes be made that render apparatus obsolete or out-of-date before its usefulness is ended.

Our successful industries are those which are leaders in research and in the application of scientific knowledge. The American investor recognizes this, and places less value upon tangible assets than upon the intangible value of a loyal, progressive organization under good leadership. Tangible assets are valuable only in so far as they can be utilized.

Many thinkers of our older civilizations "view with alarm" what they call the "Americanization" of the world. Is it not self-evident that a civilization which requires less of man's time and energy to provide him with food and clothing, and allows him more leisure for reading, studying and amusement, will develop art and science?

America can best serve the world as an example. If we can successfully build a superior civilization based upon mechanical power, it will show the way to the rest of the world. There is no other place in the world where new economic theories can be tested out with equal probability of success, and less penalty to the whole in case of failure. Half of the purchasing power of the world is concentrated in America.

Papers on Welding at the National Metal Congress

The American Welding Society, through Chairman P. W. Swain of the meetings and papers committee, announces the papers to be presented during the fall meeting of the society to be held in Cleveland the week of Sept. 9 as its part of the National Metal Congress. The iron and steel divisions of the Mining and Metallurgical Engineers and of the American Society of Mechanical Engineers, the Institute of Metals and the American Society for Steel Treating will have conventions in Cleveland during the same week. During the National Metal Congress the National Metal Exposition will be held, of which over 10,000 sq. ft. will be devoted to exhibits of welding and cutting equipment and supplies. Some 30 firms dealing in this material already have made reservations.

The papers to be presented by the American Welding Society are as follows:

"Non-destructive Tests of Welds," by Elmer A. Sperry, Sperry Development Co., Brooklyn.

"X-Ray Investigation of Welds," by Dr. H. H. Lester, Watertown Arsenal, Watertown, Mass.

"Oxy-acetylene Welding of Pipe Lines in the Field," by W. R. Ost, Air Reduction Sales Co., New York.

"Welding of Pipe Lines," by H. C. Price, manager, Welding Engineering Co., Bartlesville, Okla.

"A Metallographic Study of Some Metallic Arc Welds," by Prof. H. M. Boylston, Case School of Applied Science, Cleveland.

"Welding of Copper and Copper Alloys," by Mr. Hook, research laboratory, American Brass Co.

"Welded High Strength Aluminum Alloys for the Aircraft Industry," by Mr. Dawson, research laboratory, Linde Air Products Co., New York.

"Foreign Practice in Welding of Boilers, Tubes and Drums," by G. A. Orrok, consulting engineer, New York.

"Stress-Strain Characteristics of Welded Joints," by Prof. J. H. Smith, University of Pittsburgh.

"Study of Nitroid Needles," by P. Alexander, General Electric Co.

"Cutting and Welding Steel Parts to Replace Castings," by W. J. Buchanan, Bessemer Gas Engine Co., Grove City, Pa.

"Testing Equipment Used in the Welding Industry," by V. G. Tatnall, Southwark Foundry & Machine Co., Philadelphia.

"Machinery Design as Influenced by Electric Welding," by H. G. Boist, General Electric Co.

Truscon Steel Co. to Sell Stock to Employees

More than 5000 employees of the Truscon Steel Co. will have opportunity to subscribe to 20,000 shares of Truscon common stock. The new issue was authorized at a meeting of the board of directors in June. It is to be sold to employees at $40 a share. The present market value is about $60.

Each employee may purchase stock up to 20 per cent of his 1928 earnings. The company reserves the right to pro-rate the issue if it is over-subscribed. A partial payment plan is offered.

Stove Pipe Makers Form Trade Group

A new group has recently been formed in the Metalware Institute, Inc., 342 Madison Avenue, New York, composed of manufacturers of stove pipe, elbows and drip pans. It is functioning along lines recognized as legal and proper and some of the objects of the stove pipe group are: To discuss legislation, transportation, insurance, manufacturing and related problems; to establish a system for investigating credits and collecting information concerning the character and standing of purchasers; to establish a bureau of statistics for stocks on hand, production, unfilled orders, shipments, orders received, actual prices at which orders accepted were sold, etc.; to cooperate with the Division of Simplified Practice existing in the Department of Commerce to obtain the elimination of obsolete or unnecessary varieties, styles, and sizes; and to collect quarterly departmental labor costs and labor efficiency ratios.

Automobile Output Attains New High Record

With June production of cars, trucks, and buses totaling approximately 536,309 units, the National Automobile Chamber of Commerce estimates that the automobile industry set a new record in the first half of 1929 in manufacturing 3,380,088 vehicles. This exceeds the same period of 1928 by 1,053,579, or 45 per cent. June output was the highest for that month and showed a gain of 26 per cent over June, 1928.

Cast Iron Pipe Makers Want Higher Duty

Approve 30 Per Cent Ad Valorem Rate Fixed in House Bill—Importer Protests Increase

WASHINGTON, July 9.—American cast iron pipe producers are generally satisfied with the duty of 30 per cent ad valorem fixed in the House tariff bill, according to testimony given befor the Senate sub-committee which is considering the metal schedule.

Filing a brief for 10 cast iron pipe foundries, F. S. Russell, United States Pipe & Foundry Co., Burlington, N. J., asked for a duty of 30 per cent with a proper method of determining foreign costs, or, preferably a specific duty. A similar request was made by Walter Wood, R. D. Wood Co., Philadelphia, who definitely suggested a specific duty of 6/10c. a lb.

"The bill as passed by the House gave a 30 per cent ad valorem duty," said the brief filed by Mr. Russell. "If the administrative features of the bill are such that the importer must prove to the satisfaction of the Government that valuations at which they are importing are not lower than prices at which similar material is offered for sale in the usual quantities in their home market, and if the American manufacturer is permitted to be a party to such proceedings, the members of the industry which I represent, while preferring a specific duty, acquiesce in the rates given by the Ways and Means Committee. I firmly believe, however, that past experience has shown that, in the absence of an American valuation as a basis of ad valorem duties, specific duties would work out to the best interests of all concerned."

Says Industry is "At War"

Mr. Wood said that the duty of 30 per cent would be protective, but not prohibitive, and would mean a strong struggle against French importations. He said that imports are to be compared with production of American pipe foundries along the seaboard, and not with the total production. Mr. Wood told the committee that he had been told that the French pipe price in France is $35 to $37 a ton, much less than the price at which it is sold in the United States, thus implying that the French product is being dumped in the American market. American costs at the plant were said to be $35 to $36 per net ton.

"But you have been selling at $30, haven't you?" inquired Senator King.

"Certainly, sir; we are 'at war,'" said Mr. Wood.

Senator Reed asked Mr. Wood if the latter had imported pig iron from England. Declaring that he understood he was going to be "twitted" about the matter, Mr. Wood admitted that he had bought pig iron from England and had to do so in order to keep his plant going and his workmen employed. The price of the English iron at the time was said to have ranged from 50c. to $1 a ton under domestic prices. Mr. Wood said he could not have paid the latter prices and kept his plant going. He said that no imports of any size are now coming from England, France or Germany, but he thought Indian imports would continue because of the extremely low wages paid in India. Mr. Wood said he never used Indian iron because it goes into better manufactures than cast iron pipe. Replying to a query by Senator Reed, Mr. Wood expressed the opinion that pig iron is entitled to a somewhat higher duty than that of $1.125. Merchant furnaces in this country, he stated, can barely live at the present duty.

Herbert Kennedy, Herbert Kennedy Co., New York, importer, protested against the increase to 30 per cent provided in the House bill for cast iron pipe. The existing duty is 20 per cent. He said that the cost of production at the Pont-à-Mousson foundry in France, which he represents, is never below $20 a net ton and that the difference in French and American costs are not great enough, when other charges, such as the duty, inspection, freight rates, etc., are taken into account, to justify a higher tariff. He also said that imports of cast iron pipe from France are decreasing and indicated that this was due in part to increased efficiency by American producers through the use of the centrifugal process. He told the committee that he is head of Intercontinental Pipe & Mining Co., recently organized, with a view to erecting a plant in Massachusetts to meet domestic requirements. His company, he stated, would be satisfied with the duty of 20 per cent.

A. C. Dinkey, Midvale Co., Philadelphia, asked for an increase to 60 per cent in the duty on reaction chambers. The House bill carries a duty of 40 per cent.

French Cast Iron Pipe Plant Here Going Ahead

The Intercontinental Pipe & Mining Co., 475 Fifth Avenue, New York, recently incorporated in the United States by the Société Anonyme des Hauts Fourneaux et Fonderies de Pont-à-Mousson at Pont-à-Mousson, France, to build a plant here, has engaged Fay, Spofford & Thorndike, 44 School Street, Boston, as consulting engineers for the project. A contract for construction of a wharf and bulkhead and for dredging and filling in the river on the company's property at Chelsea, Mass., has been awarded to the Bay State Dredging & Contracting Co., Boston, and work will begin at once. The Boston & Maine Railroad is building a spur and siding on the property. Plans for the foundry, which will have an annual capacity of 150,000 tons of cast iron pipe, ranging from 4 in. to 24 in., have been completed and the company will probably award the contract for its construction in a few weeks.

According to Herbert Kennedy, agent for the Pont-à-Mousson Works in the United States and an officer of the Intercontinental Pipe & Mining Co., equipment for the foundry will be purchased from American manufacturers, except for certain special machinery used in a development of sand-spun centrifugal pipe, the patents on which are owned by the Pont-à-Mousson Works in France.

The wharf being constructed at Chelsea is to serve the twofold purpose of shipping cast iron pipe by water and importing North African iron ore from two mines controlled by the Pont-à-Mousson Works, the ore to be furnished to the furnace at Everett, Mass., adjacent to the company's plant.

Chicago Railroads Denied Lower Rate to Milwaukee

Western railroads which serve Milwaukee from Chicago have been refused by the Interstate Commerce Commission permission to establish a 7c. rate on iron and steel moving between these two points.

The Chicago & North Western, Chicago, Milwaukee, St Paul & Pacific, Elgin, Joliet & Eastern and the Minneapolis, St. Paul & Sault Ste. Marie entered this plea on the contention that lower rates are necessary to meet water competition.

Denial was based on the fact that this request is contrary to the intent of the long and short haul clause of the fourth section of the act to regulate commerce. These railroads are now preparing to enter a plea for an 8c. rate between these two points.

With the opening of navigation, round tonnages of steel moved by boat from Chicago mills to Milwaukee, and as the season has advanced an increasing number of cargoes of steel have moved from Western mills to points of consumption on the Great Lakes.

Illinois Steel Expansion Will Be 1;500,000 Tons

Illinois Steel Co. has announced that it will increase steel producing capacity at its South and Gary Works to the extent of 1,500,000 tons annually. This plan includes the construction of 14 open-hearth furnaces, blooming and slabbing mills, a structural mill and two plate mills. Construction will be commenced at once. The steel ingot capacity of mills in the Chicago district is normally computed at 10,200,000 tons annually. The construction program which is being undertaken by the Illinois Steel Co. will increase output in that district by about 15 per cent.

Industrial Leaders Direct Standardization

On July 9 the first board of directors of the American Standards Association, a national federation of 40 technical, trade, and industrial organizations and Government departments will organize. Recognition by industrial executives of the savings to be made through standardization led to reorganization of the association to place control of standardization policies into the hands of industrial leaders. Announcement of the move was made by James A. Farrell, president United States Steel Corporation, and, since 1925, chairman of the advisory committee of the American Standards Association.

The board of directors will include in its membership Matthew S. Sloan, president of the New York Edison and affiliated electric companies; L. A. Downs, president Illinois Central Railroad; Bancroft Gherardi, vice-president American Telephone & Telegraph Co.; F. E. Moskovics, president Improved Products Corporation; Quincy Bent, vice-president Bethlehem Steel Co.; Howard Coonley, president Walworth Co.; C. L. Collins, president Reliance Electric & Engineering Co., and Dr. George K. Burgess, director United States Bureau of Standards.

One of the questions to be considered is that of American participation in international standardization activities. The International Standards Association, an affiliation of the national standardizing bodies of Austria, Belgium, Czechoslovakia, Denmark, Finland, France, Germany, Holland (with reservation), Hungary, Italy, Norway, Russia, Sweden and Switzerland has formally invited the American Standards Association to its membership. Although the American body was represented in the organization of the International Standards Association, membership has been kept pending to await the action of the board of directors. The International Standards Association now maintains an office at Baden, Switzerland.

The full control of national standardization policies, since the organization of the American Standards Association as the American Engineering Standards Committee in 1919 has been entirely in the hands of engineers and scientists. The reorganization which led to the formation of the board resulted from the increasing interest of industrial executives in national standardization work. The meeting of the board is expected to be followed by an intensive campaign to finance national standardization activities on a larger scale than heretofore.

Human Relations Is Topic of Conference

Stability of employment, the older worker's place in industry, getting the most out of the personnel department and larger conceptions of safety are among the major themes to be discussed at the twelfth annual conference on human relations in industry at Silver Bay, Lake George, N. Y., Aug. 28 to Sept. 1. The conference will be preceded by industrial leadership courses beginning Aug. 20.

Industrial Advertisers to Meet in Cincinnati

The eighth annual convention of the National Industrial Advertisers Association will be held in Cincinnati, Sept. 30 and Oct. 1 and 2. Arrangements for the meeting are in the hands of Jesse R. Harlan, chairman of the convention committee of the Cincinnati Association of Industrial Advertisers. Mr. Harlan is advertising and sales manager of the Stuebing-Cowan Co., Cincinnati. Sub-committee chairmen are: Sherman Perry, American Rolling Mill Co., Middletown, Ohio, program; C. Kenneth Magers, Union Gas & Electric Co., Cincinnati, publicity; Samuel Glueck, Key Advertising Co., Cincinnati, exhibits and panels; R. W. Bohnett, Bohnett Co., Cincinnati, entertainment; Frederick B. Heitkamp, Cincinnati Milling Machine Co., attendance; George Gauff, *Manufacturers Record*, hotel and registration, and William Heilig, William Powell Co., Cincinnati, transportation.

Data Service in Steel Construction

A technical data bulletin service for the benefit of its members has been started by the American Institute of Steel Construction, New York. The first bulletin, which is of four pages, deals with the effect of temperature on structural steel. Succeeding bulletins will contain the results of engineering research and latest technical information regarding design and fabrication, and will outline the best methods to be pursued in designing or erecting steel structures.

Metallurgical Congress in Belgium Next Year

An international congress of mines, metallurgy and applied geology is to be held at Liége, Belgium, toward the end of June next year. A congress of the same description was held in Düsseldorf in 1910 by the Iron and Steel Institute (British), the Institution of Mechanical Engineers, the Institute of Metals, and five other organizations, but the handling of the coming congress will be directly in the hands of the association of alumni of the engineering school of Liége and the Belgian Geological Society. The congress has been scheduled for Liége because in 1930 will occur the Liége International Exhibition. O. Lepersonne, 16 Quai des Etats-Unis, is secretary general.

DR. GEORGE K. BURGESS, director Bureau of Standards

F. E. MOSKOVICS, president Improved Products Corporation

Four of the Directors of the American Standards Association

HOWARD COONLEY, president Walworth Co.

QUINCY BENT, vice-president Bethlehem Steel Co.

This Issue in Brief

Makes 46 per cent saving in fuel used in heat-treating by installing inspirators which regulate the gas-air ratio, to give either a reducing or oxidizing furnace atmosphere, regardless of the flow of gas.—Page 88.

* * *

Good design, not heat treatment, is the secret of successful spring manufacture, says maker. A spring made of annealed wire will support as much load as a heat-treated or cold-drawn spring, if elastic limit of the soft material is not exceeded. If springs have suitable hardness and still do not perform, the design should be changed rather than the hardness increased.—Page 84.

* * *

Low "customer turnover" is a major factor in earning adequate profits. Keeping customers satisfied with price, quality and delivery is the secret of low customer turnover, says successful manufacturer.—Page 82.

* * *

Mergers are no substitute for capable management, says Link-Belt president. As with small units, their earnings depend entirely on the sound judgment and foresight of the management.—Page 82.

* * *

Electrically welded pipe is made by first forming skelp into cylinders, which are moved by conveyors into electric welding machines. Conveyors at delivery end of machines pick up the pipe and carry it to milling machines, where the welding bead is removed for joint-coupling in the field.—Page 94.

* * *

Manufacturing losses and wastes can be reduced by making employees realize that their performance has a direct bearing on the marketability of the product. Employees should be considered as part of the sales force, and should be taught that their employer is simply the agent for securing customers for what they (the employees) produce.—Page 82.

Brittleness in hardened steel results from nitrogen content in the iron, says metallurgist. Hot blast and high-speed operation of the blast furnace increase nitrogen in the iron by the formation of cyanogen compounds in the furnace.—Page 85.

* * *

Harmful oxide content of iron is increased by transferring the molten metal from one vessel to another, due to oxidation of the metalloids in the iron. Average content of unreduced oxides in 61 samples of basic iron tested was 0.0272 per cent, but it may go as high as 0.15 to 0.20 per cent if the blast furnace is operating irregularly.—Page 82.

* * *

Predicts economic dislocation more severe than anything the world has yet seen. Every security market in the world is in hopelessly unsound condition, says economist. Colossal mass of inter-governmental obligations arising from the war compromises the situation. Obligations must be paid by export of goods on a tremendous scale.—Page 89.

* * *

"Lost art" of hardening copper is nothing but an interesting fable, says metallurgist. The ancients' secret was merely cold-working. The art has never been lost. Recent methods of hardening copper by alloying have come about as near to actual tempering as would seem possible.—Page 96.

* * *

Soundness of weld is automatically proved by hammer test. Electrically welded pipe is continuously hammered by a series of weights while pipe is under pressure in testing machine.—Page 94.

* * *

Pre-war status of European countries will return, says economist. World is ruled by steel and coal, and the New Europe in industrial, financial or military power will be balanced nationally much the same as Old Europe.—Page 90.

Cut your costs by giving foremen a practical knowledge of manufacturing economics. They should have a clear insight into such overhead items as depreciation, tool cost, scrap charges, supply costs, supervision and inspection charges and the like, says manufacturer.—Page 82.

* * *

Keeps customers satisfied by shipping repair parts the same day order is received. Order goes to stockroom as soon as it comes in. Stockroom makes up order at once, and it is trucked almost immediately to the shipping room, rather than waiting for a day's orders to accumulate.—Page 80.

* * *

Salvages gears with surface imperfections by lapping them. Soft metallic gears are usually mounted on an arbor between centers of a lapping machine having adjustments for varying the mesh of the gears. Hardened steel gears are usually mounted on a lathe and lapped on centers only.—Page 98.

* * *

Inspectors' fatigue reduced by making gages of aluminum. Roundness of welded pipe is tested with gages made of the light metal, with steel inserts for the gaging surface.—Page 94.

* * *

Physical effort put into each job is measured by gaging the calories expended in a minute by the operator. By changing the equipment and methods, as dictated by calory measurement, considerable gain in production per unit of labor-effort has been obtained.—Page 97.

* * *

Economy in transporting parts in small quantities from department to department has been obtained by using small skid boxes and tote pans, so designed that electric truck can carry a capacity load made up of a number of different parts. Trucks take three skids at one time, each skid containing a different kind of part.—Page 78.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

A Year's Great Gain in Steel

PRODUCTION of steel ingots in what may be called the steel year through June 30 was approximately 54,675,000 tons, or 25,000 tons more than the forecast made in THE IRON AGE of four weeks ago. That is a full 15 per cent in excess of production in any period of 12 months ending in any month prior to a year ago. There is a gain of 9 per cent over the calendar year 1928, but that year included one-half of the year now under review.

The steel year contains 311 working days. The year through last month was a day short, beginning and ending with a Sunday, while there had been an extra day in February, 1928. Transferring one day's production to make years of equal length and adding to the production reported monthly an allowance for electric and crucible ingots, production has been as follows:

Year through June 30:	Gross Tons
1925	39,450,000
1926	45,900,000
1927	46,800,000
1928	44,650,000
1929	54,675,000

In two years there is a gain of 7,875,000 tons, or nearly 17 per cent, which is phenomenal, being 8 per cent per annum, against an average annual gain of 2.6 per cent from 1920 to 1928, or an average of 3.4 per cent from 1913 to 1928.

And the steel industry is not done making records, for production is now running far above that of a year ago. Given a continuance of the rate of production in the last two months, production in the 12 months through July will be about 1,100,000 tons more than that in the 12 months through June, while August would make a further contribution of about the same amount. Production would have to slip next October to a rate 12 per cent under the recent rate to stop this making of new totals for 12 consecutive months, for output in the last two months has been about 195,275 tons per working day, while last year October, the high month, showed 172,221 tons per day. July of last year ran only 152,224 tons a day. Thus for an indeterminate time to come we shall be producing more steel than a year previous. Nothing like an enlightened guess can be made as to how long this making of new records for periods of 12 months will continue. As time passes the pace of a year previous will be harder to exceed; but the outlook for records is promising, since the present rate is about 6,000,000 tons a year above the actual production in the last 12 months.

Mr. Schwab spoke with eminent conservatism, even with restraint, in telling the American Iron and Steel Institute in his May address that "it is not inconceivable that the average annual production of steel ingots for the next 10-year period will exceed 50,000,000 tons." And then he added: "At this rate the consumption of raw materials will soon reach the staggering total of a quarter of a billion tons a year."

The Rate Shift in Cast Iron Pipe

ABOUT 40 years ago, the cast iron pipe industry, which once was so largely a Northern development that pipe made near Philadelphia was laid in the streets of Birmingham, began its exodus to Alabama. There it was favored by low-priced labor and pig iron and was granted special freight rates by the Southern railroads to foster its growth. With these advantages, the industry flourished in the South to such an extent that now 60 per cent of the total capacity is in Alabama and Tennessee. Today the Southern pipe trade is disturbed by the prospect of losing some of its predominance because of the recent decision of the Interstate Commerce Commission that existing freight rates are prejudicial to Northern foundries and "unduly preferential" to those in the South.

Although the cast iron pipe case was not linked up with the general rate investigation on iron and steel products, the decision is along the same lines; that is, a mileage scale is now the basis of the rate structure. When the revised tariffs are published by the railroads they will work out to the advantage of Northern foundries to the extent of about $2 a ton on shipments to many points in the Northern territory; furthermore, Northern foundries will be able to compete at points south of the Potomac River for the first time in many years.

Just what the ultimate effect will be on the cast iron pipe industry, particularly that portion of it in Alabama and Tennessee, remains to be seen. In recent years the differential in pig iron costs in favor of the Southern foundries has not been so marked as before the war, and labor efficiency in the North has been to some extent an offset to the higher scale of wages paid by Northern foundries.

SOME unusual uses for alloy steels are appearing, uses that are amply justified. Not so long ago it would have been regarded as uneconomical and at all events unnecessary to make shovels or common tools from anything but ordinary carbon steels. Today one American producer of various grades of hand shovels employs an alloy steel extensively, with the result of increasing the life of his product and hence the de-

mand for it. Another company has incorporated an alloy steel in mine picks and other tools with excellent results—a harder tool and one whose edges or points hold up longer and better. Alloy steels and heat treatment have been the remaking of the automobile industry, and their increasing application to lesser industries is highly promising even though much less spectacular.

Wage Assignment Law Tightened

MASSACHUSETTS has just passed a law designed to reduce abuses that have grown up under the statute governing the assignment of wages. An amendment provides that unless an assignment be formally accepted by the employer it shall not be legally binding. Hereafter, in every instance where an employee desires to assign his wages as security for purchase or loan or for other reason, he must have the consent of those who employ him. Responsibility is thus placed where, for the good of the average worker, it should rest. The new provision is a protection against too readily going into debt and against persons who would take advantage of an employee's weakness.

In Massachusetts until now, as under the laws of most of the States, there was no necessity that the employer have any knowledge of employee transactions involving wages yet to be earned. An assignment had to be recorded with the town clerk, but only rarely was publicity given to these records. The company got its first knowledge when a merchant or money-lender presented the assignment papers, leaving no alternative except it were the discharge of the assignor. If the account was for less than $300, 25 per cent of the contents of the pay envelope had to be held out; if for more, a much larger per cent. The usual practice has been, in the growing leniency of owners, to retain the man, but the incident has often been regarded as a black mark.

The change in the law should operate automatically to reduce the number of assignments of wages, apart from employers' refusals to accept them, since in a majority of cases an employee will hesitate to ask an acceptance unless his reason is a good one. The average worker is not apt to go to the office for this sort of help in buying a radio set or electric refrigerator or motor boat or automobile. In one case, however, a corporation actually advised this method of purchasing a second-hand car to be run between the shop and a home which a man had built with his own hands some miles in the country. The car was judged an economic necessity. But generally speaking the new Massachusetts law will make it easier to resist the constant temptations of the installment plan and the pressure of certain dealers who specialize in sales to improvident wage-earners.

A NEW record for six months' pig iron output in the United States was made in the first half of the year—at 21,621,363 gross tons—and now a calculation is in order of the probable 1929 production. In 1923, the record pig iron year, when 40,361,146 tons was made, the first half output was 21,016,475 tons. The falling off in the last half was 1,671,804 tons, or practically 8 per cent. Assuming the same percentage of decrease this year, the output for the last half would be 19,892,000 tons, bringing the year's total to 41,513,000 tons. Even should the decline in the rest of the year approximate 10 per cent, the total for the 12 months would be close to 41,100,000 tons. It seems reasonably assured that the 1929 pig iron output will reach a new high peak at not less than 41,000,000 tons, with a fair probability of attaining 41½ millions.

Swings in Our Trade Balance

OUR foreign trade showed a favorable balance of $119,122,000 in January and only $15,195,000 in April. The average business man takes an interest in our foreign trade, but is quite unable on account of the mass of detail to observe even approximately just where and why the changes occur. Sometimes he is even hazy as to the economic bearing of the general result, whether a large trade balance is to be considered favorable as likely to produce good conditions at home or is unfavorable as showing that selling conditions at home have not been good.

Monthly figures for last year chanced to line up in such a way that a relatively simple analysis can be made as to the points at which our foreign trade underwent a wide variation. The year's favorable merchandise trade balance was $1,036,912,000, which was the largest since 1921. Incidentally that must not be taken as an invidious comparison, for while 1921 was a very poor year with us there were some remains of an exceptional export movement, and our imports were much smaller than in subsequent years.

There was, however, nothing like a uniform trade balance during last year. The low month was April, at $18,614,000, and the high month November, at $218,347,000. It chances that April was also the low month in exports and November was very close to the high month in exports; hence exports only need be considered for a general study of this remarkable fluctuation. Total exports were $363,928,000 in April and $544,912,000 in November, the difference being $178,034,000, representing a 50 per cent increase.

Five-sixths of this increase in exports is found in three items. Textiles increased $103,785,000 or 155 per cent; vegetable food products and beverages, $29,515,000 or 103 per cent, and tobacco $13,999,000 or 125 per cent. Clearly this was largely or wholly a seasonal matter, November against April.

Various gains—in iron and steel, non-ferrous metals, machinery, petroleum, etc.—make up the remainder of the increase and offset certain decreases. There was no increase in automobiles, parts and accessories, but a decrease of $183,000, though in itself insignificant—less than 1 per cent.

Having observed the principal causes of last year's change from April to November, April of this year may now be considered in connection with the preceding April—its favorable merchandise balance of $15,195,000 comparing with $18,614,000 a year previous. There was an increase of $61,944,000 in exports but a slightly larger increase, $65,363,000, in imports.

In brief, we are doing a larger foreign trade this year than last, in both exports and imports, and by the precedent of last year we may expect our trade balance to increase by a seasonal swing.

CORRESPONDENCE

Germany's Reparations Problem as Her Steel Men View It

To the Editor: Your comments on page 1657 of your issue of June 13 on "Germany's Reparations Bill" have aroused much interest in the German steel industry.

As you know, the president of the United Steel Works, Doctor Vogler, was one of the two German experts in Paris, but he refused to sign his name to the Young scheme. I have been requested on behalf of the Federation of German iron and steel producers to make a short reply to your statement, thinking that the opinions here expressed may interest you, inasmuch as the Young scheme will certainly have its economic influence upon Germany's industrial expansion in the years just ahead.

Before the war (exactly, on Aug. 1, 1914) the aggregate bank savings of the German population were 21 milliards (billions) of marks. This year (June 1) they were 7½ milliards. The national wealth of Germany at the end of 1928 was estimated to be 62 per cent of the wealth in 1913. When estimating the German payments it must not be forgotten that, apart from the two billion marks to be paid annually in accordance with the Young scheme, Germany has other war debts (internal debts, also those to neutral European powers, etc.), which, according to the recent publication in the Reichstag, are close to 1.9 billions annually, bringing the total payments on war debts to 4 milliards annually.

Among steel industrialists it is believed this amount could be paid, considering that taxation is now three times higher than in 1914, and in spite of the loss of Alsace-Lorraine, Upper Silesia, large eastern and western Prussian territories and North Schleswig. But 2 billions of marks annually have to be paid in foreign money, not in marks, and this is the whole problem in a nutshell. Germany has lost all her colonies, has lost all the loans to foreign countries, almost all the property invested abroad (sequestrated during the war). Besides this she has to pay the French and British armies in the Rhineland in foreign money; about 5 milliards to Belgium (marks spent there during the occupation); has to pay interest on foreign loans, etc.

The German Reichsbank published last month details of the adverse trade balance of Germany. Last year the visible and invisible imports (interest on loans, etc.) exceeded by 3¾ billion marks the visible and invisible exports. This huge balance has been covered by capital influx. Since 1924 Germany has borrowed approximately 19 billion marks abroad and has loaned ½ billion to foreign countries. So interest is rapidly accumulating (more than 1¼ billions annually already) and, in the opinion of men in the German steel industry, this capital import will not keep up very long. You know that the British experts have themselves said that all the payments made by the German Government since 1924 were from money borrowed in the United States, England and elsewhere. Germany could pay the 2 milliards, if her visible and invisible exports (I refer to the Dawes plan, which was built upon this suggestion) should exceed the visible and invisible imports. Since this is not the fact, Germany will be able to pay as long as the United States and the other countries are investing money in Germany and not one day longer.

A remedy is to be found in the giving back of the colonies, and the granting of access to the allied countries for German industrial products, etc., so that the trade balance might be changed. But there is nowhere any thought of returning the colonies, and as the customs walls are raised from year to year, there seems to be no way out of this problem.

The reparations solution is not a question of how much Germany can pay (and it is believed that the 2 milliards annually can be paid), but *how* she can pay it, since the deliveries of merchandise on reparations account also are to be stopped. If Germany pays, it has to be in dollars, pounds, francs, etc., and this money she can get only from a very heavy surplus of exports over imports, plus interest on nearly 20 milliards of foreign money, etc. This at the present moment is impossible.

PAUL FIDRMUC.

Hamburg, Germany, June 24.

Alloy Steels, Past and Future

To the Editor: My attention has just been called to an article in THE IRON AGE, May 16, page 1339, by W. J. Priestly, on the use of alloy steel, showing what great strides have been possible in recent years due to the use of this material in engineering structures.

The writer firmly believes that in works of considerable magnitude the use of alloy steels will make possible, in the next few years, very great changes in design and construction methods. Looking at the past, however, Mr. Priestly has made a misleading statement with regard to the use of alloy steel in aircraft. Ten years ago last month, namely June 14, the Atlantic was crossed in a British Vickers plane, piloted by Alcock and Brown, in the record time of 16 hr. and 12 min. It is true that for the next eight years no further direct crossing was made, but the fact remains that this feat was performed and the machine stood up to it.

It is well known that alloy steel was extensively used in Rolls-Royce engines and has been in fairly general use for high-grade engines much longer than the ten years mentioned in the article in question.

Consulting Engineer.

Jenkintown, Pa.

Classification of Sponge Iron in the Tariff

To the Editor: In THE IRON AGE for July 4, page 29, your Washington correspondent reports, from the Senate hearings on the tariff, the writer's statement as a witness on sponge iron classification that the "old rate" was 30 per cent. The records of the hearings show that this report is not correct. The statement was that the old rate was the same as for pig iron, or $1.125 per gross ton.

The first imports of sponge iron occurred during 1926. The material continued to be imported during 1927 and 1928, mainly through the ports of New York and Philadelphia. From the beginning, and continuously since, the appraisers at these two ports classified the material with pig iron. Their classification and understanding of the material was logical and no protest was ever filed against their decision.

The first shipment ever taken in at Baltimore, however, was assessed according to paragraph 214, which covers earthy or mineral substances, etc., and provides a duty of 30 per cent ad valorem. Through a ruling by the customs authorities in Washington on Feb. 27, just before the change in administration, the Baltimore decision was upheld without a hearing, and is now duly protested. To anyone familiar with sponge iron, which, of course, is a metal and must be considered under the metal schedule, the ruling does not seem to have any foundation, and it is hoped it will be rectified in the customs courts.

The writer's protest in Washington was thus in no way a demand for the lowering of any duty rate, but was rather a plea that the classification of sponge iron should be continued under a paragraph at least not higher than paragraph 301, covering pig iron and scrap.

In view of the fact that no sponge iron is produced

at the present time in the United States, and that there is no prospect of its being produced for sale to the general steel trade at all for some time, the lowest possible duty would seem desirable to domestic interests. The steel industry has agreed that this is the case and the writer's testimony and application for the retention of a duty not higher than pig iron has been supported by the majority of the makers of high-grade steel.

Anyone familiar with the raw materials used in present-day steel making will realize that there is no competition between sponge iron and any other material regularly used. It seems entirely out of line to compare sponge iron with muck bars instead of with pig iron when considering the proper classification of the material. Both pig iron and sponge iron are initial products from the reduction of iron ore, but muck bars, as well as any other material mentioned in paragraph 303, are manufactured products—manufactured from pig iron or from sponge iron.

N. K. G. THOLAND,
Ekstrand & Tholand.

New York, July 6.

Casting Steel in a Water-Cooled Copper Ingot-Mold

ALTHOUGH the process of casting metals in water-cooled molds is not new, it has a number of advantages over the usual procedure and was therefore subjected to a careful experimental study by W. Oertel, who describes his results in *Stahl und Eisen*, May 9, 1929. An abstract follows:

The mold used contained 200 kg. (440 lb.) of steel and consisted of a copper tube 200 mm. (about 7.9 in.) inside diameter, 20 mm. wall thickness, and 1000 mm. in length. This was surrounded by a cast iron jacket which allowed an annular water space about 700 mm. wide (about 2.75 in.).

In casting, the steel solidifies very rapidly, so that in a few minutes the ingot may be removed from the mold. A small pipe occurs well up toward the upper surface of the ingot. Additional advantage over the uncooled mold arises from the excellent surface and the absence of segregation in ingots made in the copper mold.

In respect to crystalline structure of the ingot—the water-cooled mold offers definite advantages in that the grain-size is smaller througout than with the usual casting practice.

A number of heats of various grades were made in a small Heroult furnace. Each was cast in the water-cooled mold and in an ordinary mold. Comparison of the physical properties of the two ingots revealed practically no difference. If there is any, it is probably in the greater uniformity of the properties of the quickly-cooled ingot.

From an operating standpoint the following advantages may be cited:

The reduction in the cooling time of the mold.

Longer mold life, since cracking or cutting the surface does not take place.

Greater rolling mill yield due to the location of the pipe at the extreme top of the ingot, even without the use of a hot-top.

Excellent surface of the ingot, enabling it to be rolled without any preparation.

Improvements in Tool Steel

To indicate that progress in tool steel manufacture is still being rapidly made, H. E. Kershaw, chief research chemist of Edgar Allen & Co., Ltd., Sheffield, England, writing in *Edgar Allen News*, gives some figures on the proper speed of standard cut. A quotation from Harbord's "Metallurgy of Steel" shows the developments up to 1910:

Original high-carbon tool steels.....	16 ft. a minute
Mushet's self-hardening steel.....	26 ft. a minute
Taylor and White's high-speed steel....	60 ft. a minute
Modern high-speed steel.....	100 ft. a minute

Further advance that has been made up to the present is shown by tests on four different qualities of high-speed steel, carried out under identical conditions. The tools were all of the same size. The cutting speed was the same, the depth of cut and the traverse, and therefore the amount of metal removed per minute was the same. The tools were put to work on the same bar, which was of uniform hardness throughout.

The 14 per cent tungsten high-speed steel stood up for 4 min. 30 sec. The 18-per cent tungsten high-speed steel stood up for 8 min. 12 sec. The super-high-speed steel stood up for 14 min. 6 sec., and the very latest development in super-high-speed steels stood up for 23 min.

"The 14-per cent tungsten steel was a revelation when it was first introduced, and now there are steels on the market five times as efficient," concludes Mr. Kershaw.

Automatic Continuous Manufacturing

Simultation, a word coined by Edward Payson Blanchard, of the Bullard Co., Bridgeport, Conn., to define the ultimate in the use of machinery for manufacturing, is the theme of a discussion of the philosophy of production which Mr. Blanchard recently contributed to the *Financial Survey*, of Hartford. The principle, which comprehends a completely automatic continuous process, without hand work or man power, is calculated to bring, he says, the 4-hr. work period. It is the step beyond mass production, which itself has raised the issue of the 6-hr. shift, and it multiplies the problems of added leisure, though at the same time encouraging the scattering of homes and the maintenance of a high standard of living. In the nature of the case the article is speculative rather than prophetic.

The author is sure that job shops will still be essential and that the all-around mechanic, who prefers diversified jobs, will find his opportunity there. Also, says he, the industry which builds the complete automatic machinery for production will never be run on such a scale as that machinery is itself used. Further, there will always be a market among those people who are willing to pay an extra cost for distinction from the common mob of standardization; "there will always exist a birthright in originality."

Effect of Cold Work on Corrosion of Steel

To find out the effect of cold work on the liability of iron and steel to corrosion, a Japanese investigator, Hikozo Endo, has made an investigation. The specimens were subjected to strains different both in amount and kind (tension, torsion, compression and impact), and were subsequently submitted to the action of a 1 per cent sulphuric acid solution, the weight loss of each specimen being measured after the lapse of 72 hr.

From the results obtained, the investigator concludes that, if the stress is so large as to give rise to a permanent deformation of the specimen, its effect, consisting in the promotion of the corrosion of the latter, begins to appear, the degree of corrosion varying with the amount of deformation.

Iron and Steel Markets

Summer Steel Pace to Be High

Heavy July Operations Follow Record-Breaking Ingot Output of 28,967,174 Tons in First Half and Large June Total of 4,881,370 Tons

FRESH accumulations of steel orders and specifications since the opening of the third quarter give renewed assurance that the steel industry will operate through July and possibly even August at close to maximum capacity.

Though the pace of steel buying has slackened in some districts, Chicago sales were the largest for any week this year. Heavy releases were also received by Pittsburgh mills.

Coming on top of a record half year which exceeded the largest previous six months' ingot output by almost 4,000,000 tons, the vitality of current demand is the more surprising. No evidence of the usual midsummer letdown is in sight.

July output probably will not fall far short of the large June total of 4,881,370 tons, which was at a rate only fractionally below 100 per cent of capacity. The holiday, heat and special repair shutdowns are primary checks at the moment to continued high performance.

Last month's unexpectedly large total brought the aggregate for six months to 28,967,174 tons, which surpassed that of the same period in 1928 by 4,169,101 tons and the previous all-time six months' record of 25,067,122 tons in the last half of 1928 by 3,900,052 tons. The output of each of the past four months has been larger than any monthly total ever before achieved. For the full year to July 1, the ingot output was 54,034,296 tons.

Backlogs of some products are being reduced, with the result that earlier deliveries are possible, particularly on hot-rolled and cold-finished bars, structural shapes and strip steel. In plates and sheets, however, mills have orders that will carry them through the summer without important additions.

Over the midsummer inventory period, many consumers have permitted their steel stocks to run low, and the volume of specifications received so far in July indicates that most buyers are now fairly certain that their summer needs will not be appreciably lower than in the second quarter.

The slowing down in the demand for steel from the automobile industry probably will be less than summer usually brings. Some parts manufacturers have again speeded up schedules to meet the calls from motor car makers preparing to bring out new models. Previous records for July and August are expected to be broken because of the continued high operations of the two leading makers of low-priced cars.

June automobile production, at 536,309 units, broke all records for that month and made a half year's total of 3,380,088 motor vehicles of all types, exceeding the output in the first half of 1928 by 1,053,579 units.

Railroad inquiry for steel is noteworthy. Supplementary rail inquiries include 30,000 tons for the Great Northern and 5000 tons for other Northwestern roads. The Canadian Pacific has placed a large rail order with the Algoma mill. Bridges in New Jersey for the Pennsylvania will take 14,000 tons of shapes, and the Lackawanna Railroad has ordered 4000 tons for catenary supports as a beginning of its electrification program. The Wabash has bought a car ferry requiring 2500 tons. Meanwhile, car builders are taking steel heavily to complete recent car orders. Upward of 30,000 tons will be ordered for 4000 car bodies recently placed by the Pennsylvania. New railroad equipment buying is light.

Several large gas line projects are taking shape. A line from the Panhandle of Texas to Chicago, also one from the Southwest to Nebraska and Iowa and others which are less definite promise heavy tonnages of pipe. The Texas-Chicago line has the backing of important oil interests.

Structural steel activity is such that a leading producer expects the third quarter to rival the second in volume. The week's total of new projects, at 49,000 tons, is the largest reported since the first week of June, while lettings were 45,000 tons. Awards of buildings only in the New York metropolitan district in the first half of the year took 243,285 tons of steel against 182,800 tons in the same period last year, a gain of 33 per cent.

Southern pig iron presents the only marked sign of weakness in the whole iron and steel situation. A reduction of 50c. a ton, the second of that amount within a few weeks, has been made by the Alabama producers in an effort to move large stocks of iron, the accumulation of which has been due in part to the subnormal consumption by Southern cast iron pipe foundries. Price weakness has also developed on pig iron sales in New England, and moderate concessions in the Pittsburgh district have resulted from the extremely competitive situation existing there now. Pig iron buying is not in large volume.

Steel prices are fairly steady, though minor weakness has occurred in some districts on wire nails and black and galvanized sheets, while at Cleveland steel bars have dropped $1 a ton to 1.90c. a lb.

Heavy melting steel scrap has advanced 25c. a ton at Pittsburgh, and signs there and elsewhere point to a definite turn upward.

THE IRON AGE composite price for pig iron has declined to $18.54 from $18.63 last week. This is the second drop in five weeks from the year's high of $18.71. The finished steel composite price is unchanged at 2.412c.

Pittsburgh

Operations Continue at Same High Rate and Deliveries Are Easing—Consumer Stocks Abnormally Low

PITTSBURGH, July 9.—Following a rather marked interruption last week occasioned by the holiday, steel operations in this district have been resumed again at about the same high rate which has prevailed for some time. But production is now somewhat heavier than current specifications warrant on most products, and, with the exception of sheets and plates, backlogs are being considerably reduced. Deliveries can now be made in two or three weeks or better on cold-finished bars, strip steel, merchant bars and shapes, and, although current demand is sufficient to assure better than usual summer operations, mills are having little trouble making shipments.

Consumer stocks of all forms of finished steel are abnormally low and the somewhat heavier specifications during the last few days indicate that users who have been slow to order out their July tonnage are now more certain of satisfactory business during the present month and early August.

The leading producer of automobiles in the low-priced field plans a record production during July, and the other maker of cars in this field is curtailing very little. The other automobile companies present a rather mixed picture, and their contracting operations are influencing the order books of makers of strip steel, cold-finished bars and even sheets. Under these conditions it is difficult to get a line on the market which might have a general application.

Makers of lap-welded tubing are in a comfortable position on account of recent large line-pipe orders, and a gas line extending from the Texas Panhandle to Chicago has been added to prospective business. Demand for standard pipe has failed to develop according to expectations.

Mills in this district have benefited from recent rail orders and railroad car builders are taking material at an undiminished rate. Structural shapes are not so active and operations of local fabricating shops are unsteady. On the other hand, barge builders are probably busier than they have ever been and business already on company books assures high activity for several months. Reinforcing bars are also active, although specifications on merchant bars have declined considerably in the last two or three weeks.

Prices are showing weakness on some products, but the larger mills are adhering rather firmly to recent quotations. Concessions of $2 a ton from the recent minimum on galvanized sheets are still reported, but are hardly representative of the general market. Wire nails are also weak in competitive districts, but this condition has persisted for a long time in the face of dull demand. Prices on semi-finished steel are still rather uncertain, with little buying of consequence.

Pig iron inquiry is more active. Concessions from recent market prices on foundry and basic iron have appeared in a few recent transactions, but the market is not quotably lower. Scrap is slightly stronger and seems to be definitely turning upward following several weeks of little fluctuation.

Semi-Finished Steel. — Unfinished steel is gradually becoming more plen-

tiful in this and nearby districts, and, for the first time in two or three months, sheet mills are being operated with a full supply of bars. A number of open-hearth furnaces in the district were down for repairs for the greater part of last week, advantage having been taken of the mid-week holiday interruption to get equipment in condition for heavy summer business. The price situation shows little change, with sellers apparently holding firm to a $35 quotation on billets, slabs and sheet bars and $40 on forging billets, while a few makers who have small tonnages for sale only occasionally are asking prices $1 a ton higher. Buying is confined to small lots, and large users in the territory have not yet covered their third quarter needs. Some of these users placed orders two or three months ago with two or more sources of supply in order to assure certain coverage of their needs, and, as some of this material is still to be shipped, they may not be forced to buy again for several weeks. This puts them in a position to resist higher asking prices at this time and prevents the market from becoming definitely established at either the asking or offering price. Wire rods are still fairly active, but demand for skelp is moderate.

Pig Iron.—Buyers are beginning to show more interest in their third quarter requirements and, while specific inquiries are not yet numerous, consumers are quietly sounding out the market. Shipments against second quarter contracts have not been completed in many cases and a few of the larger buyers may not have to cover their needs for two or three weeks. The leading merchant interest in this district reports very satisfactory business and shipments against contracts that are somewhat above the average for this time of the year. Considerable price competition is said to have developed in the recent purchase of 5000 tons of foundry iron by the Columbia Radiator Co., McKeesport, Pa. However, Valley interests which met the price of local and nearby furnaces did not get the business. The Westinghouse Electric & Mfg. Co. has not yet closed for the second-half requirements of its Trafford City, Pa., works, and the Pittsburgh Plate Glass Co. is inquiring for 400 tons of malleable iron for Ford City, Pa. An unnamed consumer is inquiring for 1800 tons of malleable iron. Other inquiries are said to be before the trade, and a large part of the current buying is being done quietly. Nevertheless it seems rather certain that considerably less than 50 per cent of the tonnage to be bought in this district for third quarter has been closed. Small lots of Bessemer iron are being taken regularly at $19, Valley, and this price is also holding well on malleable. The $18.50, Valley, and $19, Pittsburgh, local furnace prices on foundry and basic have been shaded in instances where competition was keen. However, the market is still quotable at those figures.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Bars, Shapes and Plates.—The new quarter has started out satisfactorily, considering the mid-week holiday, and some companies report unusually heavy specification to start off the new week. With no advance in price this quarter, there was no rush to place orders at the end of the last month, and the lull in business which occasionally occurs at the beginning of a new quarter seems to be missing this month. The plate business is still somewhat better than that in bars and shapes, but a heavier-than-usual movement of concrete reinforcing steel is adding considerable tonnage to bar shipments. Shapes are not so active, and, although a fair amount of business was added to fabricating shop schedules during June, operations are spotty, with occasional brief periods of practically no engagement. The heavy movement of plates is due partially to the large requirements of barge yards and railroad equipment builders. The former now have more than enough business to keep them well engaged for the entire quarter, and early reports indicate that a large number of barges will be placed in the fall for spring delivery. The high activity among barge builders this year, with consequent extended deliveries, is teaching buyers to anticipate their needs, and future business in this line is expected to be of a steadier nature. The plate price is very firm at 1.95c., Pittsburgh, and shading of bars and shapes is seldom reported in this district.

Wire Products.—Mills report another week of rather heavy specifications, but some makers report a decline in shipments of manufacturers' wire. However, the decline in automobile production seems to have had less effect on the movement of this product than in other cases, and business is considerably better than usual at this time of the year. Demand for fencing and barbed wire is declining, but warehouse stocks are not heavy and considerable consumer buying which was put off in the spring on account of unfavorable weather is expected to come out in the fall. The nail market continues to be dull, but prices on both wire and nails are holding satisfactorily in this immediate district.

Tubular Goods.—Several Western oil companies are interested in a contemplated gas line to extend from the Panhandle district of Texas into Chicago. Plans are still in the formative stage and considerable time will be required to complete investigations of the supply and probable consumption of gas before the pipe requirements of the project will be known. Plans are said to be under consideration for other large line-pipe projects, and the outlook for this type of work is growing more promising. Mills making lap-welded and seamless tubing in large sizes are fairly well engaged at present, and the third quarter is expected to be a better one from the standpoint of operations than its predecessor. Oil country demand could hardly be called active, but has

	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. carry the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	Iron Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ⅜	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ⅜	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47⅞	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		Charcoal Iron	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

shown some improvement in the last few weeks. Shipments of mechanical tubing are declining slightly.

Sheets.—Production was curtailed sharply last week on account of the holiday, with only a few mills operating more than nine turns. Specifications held up fairly well and tonnage releases thus far in the present week have been heavy. Operations this week will also be at close to capacity, as the shortage of crude steel has now ceased to be an important factor. Nevertheless, hot weather is becoming a hindrance in production and mills are very anxious to catch up on shipments before more serious curtailment results. Deliveries on blue annealed sheets and light plates still average about six weeks, while on black and galvanized four weeks is not uncommon. Automobile production during July is expected to hold at about the present level, as the sheet requirements of the leading producers show little or no decrease in aggregate tonnage. Prices are unchanged, with galvanized sheets showing the only pronounced weakness.

Tin Plates.—Conditions in this market have shown some improvement in the last two weeks. Specifications are not noticeably heavier, but crop conditions are reported favorable, and, following a more or less general suspension of operations during the last days of the past week, production this week is expected to be at about 95 per cent of capacity.

Old Material.—After several weeks of comparative price stability, the scrap market seems to be turning definitely upward, and although advances are still rather difficult to place definitely, No. 1 heavy melting steel may now be quoted at $18.25 to $18.75, in the absence of large consumer purchases. This advance might be considered only nominal, but good scrap is less plentiful than ever and dealers are having more difficulty in buying against old orders. It is reasonably certain that no dealer would be willing to sell today for less than $18.25, and a large tonnage of railroad steel, or its equivalent, would bring more than $19. As stated last week, the Pennsylvania Railroad list brought over $19, and the trade believes the Baltimore & Ohio and Norfolk & Western lists, which close this week, will also bring high figures. The latter list, which will close on July 11, contains about 4500 tons of steel. Hydraulic compressed sheets are still quotable at $18 to $18.50, and No. 2 heavy melting steel has been sold at as high as $16.50. Specialties are very scarce and dealers are having considerable difficulty in buying against old orders for less than $21.50 on knuckles and couplers or rolled steel wheels. Machine shop turnings have been sold again at $12 and the blast furnace grades have advanced 25c. to a $12.50 top.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.25 to $18.75
No. 2 heavy melting steel	16.00 to 16.50
Scrap rails	17.50 to 18.00
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	16.50 to 17.00
Cast iron carwheels	16.00 to 16.50
Sheet bar crops, ordinary	18.50 to 19.00
Heavy breakable cast	12.50 to 13.00
No. 2 railroad wrought	18.25 to 18.75
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.50 to 22.00
Railr. coil and leaf springs	21.50 to 22.00
Rolled steel wheels	21.50 to 22.00
Low phos. billet and bloom ends	22.00 to 22.50
Low phos., mill plates	22.00 to 22.50
Low phos., light grades	20.00 to 20.50
Low phos., sheet bar crops	20.00 to 21.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Strip Steel.—No pronounced decline in strip steel specifications is reported, and business seems fairly well established at the levels which have prevailed for several weeks. Reports lack consistency, as some mills are considerably behind in their deliveries on the wider sizes of hot-rolled strip while operating on a hand-to-mouth basis on the narrower materials, and others report an almost opposite situation. This indicates a rather poorly diversified demand, with business largely dependent on the fluctuating requirements of large users. Cold-rolled strip is steadier, with deliveries generally averaging from two to three weeks. On the hot-rolled material prices are holding at 1.90c. and 2c., Pittsburgh, while occasional concessions from the 2.75c. to 2.85c. range on cold-rolled strip are reported.

Coal and Coke.—The coke market continues quiet, with the furnace grade holding at $2.75 to $2.85, Connellsville, and production by independent companies well adjusted to current demand. On the foundry grade shipments are near the low point of the year and prices have little strength. The premium brands are firm at $4.85, ovens. Coal prices have gained little strength, but production is holding up well for this time of the year and industrial consumption is large.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.

Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Symington and National Malleable to Merge

Plans are under way for merger of Symington Co., Rochester, N. Y., manufacturer of railroad equipment, and National Malleable & Steel Castings Co., Cleveland, producer of iron and steel castings for railroad and other service. Consolidation will include Gould Coupler Co., Depew, N. Y., subsidiary of Symington Co., manufacturer of equipment for locomotives, passenger and freight cars, as well as its affiliated organization, Gould Storage Battery Co. The new organization will carry out expansion program for increased production. Present plants will be continued. These include iron foundries of National Malleable Company at Cleveland, Chicago, Indianapolis, Toledo and East St. Louis, Ill., and steel foundries at Sharon, Pa., Chicago and Melrose Park, Ill. Henry F. Pope is president of the National Malleable Company.

Shanghai Tungsten Exports to United States Double

Exports of tungsten ore from Shanghai to the United States in 1928 were more than twice the shipments in 1927, according to a report from Consul J. C. Huston, Shanghai, made public by the Department of Commerce. Reliable information is to the effect that existing contracts cover all stocks of tungsten ore now on hand in Shanghai.

It is reported that there are on hand at Kanchow, Kiangsi Province, near the tungsten deposits, stocks of tungsten concentrates variously estimated at between 600 and 1000 tons, of which 300 tons are contracted-for cargo, and the present asking price for the uncontracted balance is $7 per unit for September-October shipment from Shanghai. It is impossible to transport any of this stock to Shanghai for the time being, owing to the fact that the canals connecting the south of Kiangsi Province with the Yangtsze River are too shallow, due to lack of rains.

Declared exports of tungsten ore from Shanghai to the United States during the first quarter of 1929 amounted to 1,423,877 lb. valued at $187,867. There were no such shipments during the first quarter of 1928, owing to expectation of New York importers that the import duty on tungsten ore in the United States would be raised.

Semi-Finished Steel, Raw Materials, Bolts and Rivets

Mill Prices of Semi-Finished Steel

Billets and Blooms

	Per Gross Ton
Rerolling, 4 in. and under 10 in., Pittsburgh	$35.00

Ferrovanadium, per lb. contained vanadium, f.o.b. furnace	$3.15 to $3.65
Ferrocarbontitanium, 15 to 18%, per net ton, f.o.b. furnace, in carloads	$160.00
Ferrophosphorus, electric or blast furnace material, in carloads, 18%, Rockdale, Tenn., base, per gross ton	$91.00
Ferrophosphorus, electric 24%, f.o.b. Anniston, Ala., per gross ton	$122.50

Fluxes and Refractories

Fluorspar

	Per Net Ton
Domestic, 85% and over calcium fluoride not over 5% silicon, gravel, f.o.b. Illinois and Kentucky mines	$18.00
No. 2 lump, Illinois and Kentucky mines	20.00
Foreign, 85% calcium fluoride, not over 5% silica, c.i.f. Atlantic port, duty paid	$18.00 to $18.50
Domestic, No. 1 ground bulk, 95 to 98% calcium fluoride, not over 2½% silica, f.o.b. Illinois and Kentucky mines	32.50

Fire Clay Brick

Per 1000 f.o.b. Works

	High-Heat Duty Brick	Intermediate Heavy Duty Brick
Pennsylvania	$43.00 to $46.00	$35.00 to $38.00
Maryland	43.00 to 46.00	35.00 to 38.00
New Jersey	50.00 to 65.00	.....
Ohio	43.00 to 46.00	35.00 to 38.00
Kentucky	43.00 to 46.00	35.00 to 38.00
Missouri	43.00 to 46.00	35.00 to 38.00
Illinois	43.00 to 46.00	35.00 to 38.00
Ground fire clay, per ton	7.00	

Silica Brick

Per 1000 f.o.b. Works

Pennsylvania	$43.00
Chicago	52.00
Birmingham	50.00
Silica clay, per ton	$8.50 to 10.00

Magnesite Brick

	Per Net Ton
Standard sizes, f.o.b. Baltimore and Chester, Pa.	$65.00
Grain magnesite, f.o.b. Baltimore and Chester, Pa.	40.00
Standard size	45.00

Chrome Brick

	Per Net Ton
Standard size	$45.00

Mill Prices of Bolts, Nuts, Rivets and Set Screws

Bolts and Nuts

Per 100 Pieces

(F.o.b. Pittsburgh, Cleveland, Birmingham or Chicago)

	Per Cent Off List
†Machine bolts	70
†Carriage bolts	70
Lag bolts	70
Plow bolts, Nos. 1, 2, 3 and 7 heads	70
Hot-pressed nuts, blank or tapped, square	70
Hot-pressed nuts, blank or tapped, hexagons	70
C.p.c. and t. square or hex. nuts, blank or tapped	70
Washers*	7.00c. to 6.75c. per lb. off list

*F.o.b. Chicago, New York and Pittsburgh.

†Bolts with rolled thread up to and including ⅛ in. x 6 in. take 10 per cent lower list prices.

Bolts and Nuts

	Per Cent Off List
Semi-finished hexagons nuts	70
Semi-finished hexagons castellated nuts, S.A.E.	70
Stove bolts in packages, P'gh	75, 20, 10 and 5
Stove bolts in packages, Chicago	75, 20, 10 and 5
Stove bolts in packages, Cleveland	75, 20, 10 and 5
Stove bolts in bulk, P'gh	75, 20, 10, 5 and 2½
Stove bolts in bulk, Chicago	75, 20, 10, 5 and 2½
Stove bolts in bulk, Cleveland	75, 20, 10, 5 and 2½
Tire bolts	60, 5 and 5

Discounts of 70 per cent off on bolts and nuts applied on carload business. For less than carload orders discounts of 55, 60 per cent apply.

Large Rivets

(½-In. and Larger)

	Base per 100 Lb.
F.o.b. Pittsburgh or Cleveland	$3.10
F.o.b. Chicago	3.20

Milled cap screws	80, 10 and 5
Milled standard set screws, case hardened,	80 and 5
Milled headless set screws, cut thread	75 and 10
Upset hex. head cap screws, U.S.S. thread	85
Upset hex. cap screws, S.A.E. thread	85
Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Heavy Buying of Steel Features Opening of Third Quarter —Mill Backlogs Again Increase

CHICAGO, July 9.—Sales of finished steel in the past week were larger than in any like period so far this year. A liberal number of users are closing for third quarter requirements, and in addition there have been sizable tonnages of plates placed for pipe construction. New orders for bars bulk large, and it is noteworthy that some of this business is coming from automobile parts manufacturers as they swing into larger production to meet the needs of automobile makers who are about to introduce new models.

As sales mount, specifications remain steady, being fully equal to shipments and affording mill output at capacity. Non-integrated mills, though still pressed for supplies of raw steel, are having less difficulty in picking up odd lots, though often at some distance from their plants. Producers of semi-finished steel find apportionment among finishing departments less pressing and as a result some finishing units, such as hot mills, are less restricted as to rate of output and are operating nearer rated capacity.

Heavier buying of steel is placing backlogs on a more substantial basis than they have been in a number of weeks. Users' willingness to make commitments is on a par with the attitude taken at the opening of the second quarter—a situation not usually expected at this time of the year when a midsummer lull is normally experienced.

Prices for all commodities, with the exception of nails, remain steady. Plates, shapes and bars are firm at 2.05c. a lb., Chicago.

The Moline rail steel bar mill of the Republic Iron & Steel Co. resumed operation today after having been down for three weeks for extensive repairs.

Pig Iron.—July shipments of Northern foundry iron are keeping pace with the rate in June, though it is apparent that hot weather threatens to affect output of local foundries. Forward contracting is steady, and most of the third quarter contracts have been closed. A few users continue to show interest in needs for the remainder of the year. Spot sales are fully up to normal for this season. Southern iron is off 50c. to $14.50 a ton, Birmingham, or $20.51, delivered all rail to Chicago. A sale of 2000 tons is reported in this district. The silvery market is quiet except in shipments; furnace stocks are reported low, and prices are steady on actual sales. A few scattered sales of charcoal iron have been made at $24 a ton, furnace. Shipments are especially large to roll foundries.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	20.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	30.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates—Foremost of interest in this market is the news that several large gas pipe projects are rapidly taking shape. Plans are being prepared for a line from the Panhandle of Texas to Chicago and intermediate points. Another pipe line will extend into Iowa and Nebraska. The latter is presumably a part of the project which was to have supplied Omaha, Neb., with natural gas from the Southwest fields. Plate sales during the week were unusually large because of additional third quarter contracts and placing of orders for plates needed for 50,000 tons of pipe, contracts for which were announced last week. New business of importance in railroad cars is lacking, but car builders' steel specifications, at 6000 tons, reflect the activity on old orders. The Bettendorf Co. has ordered 3000 tons of plates, shapes and bars for 300 gondola car bodies which it will build for the Rock Island. Demand for oil storage tanks remains large and shops are heavily engaged. A Texas refiner has ordered 4000 tons of plates, and another lot of 600 tons is for delivery in the Southwest. An oil company in San Francisco has need for 750 tons of plates. On the whole, inquiry before the trade is for not less than 10,000 tons. Chicago prices for plates are firm at 2.05c. a lb. Deliveries, though somewhat improved, are not better than eight to 10 weeks.

Structural Material.—This market is moderately active. Shops are finding a greater variety of small orders and fresh inquiries, but for work of this kind competition is very keen. Architects and engineers are busier, but it is too early for the results of their work to take tangible form in the way of requests for prices for steel. Railroad needs for bridges and girder spans are larger, but individual tonnages are small. Noteworthy among the larger projects is a 36-story building for the Garrett Biblical Institute, Chicago. Fabricating shops are ordering steel in larger quantities, more as a precaution against the delivery situation than as a reflection of wider activity in the structural field. Deliveries on shapes average six weeks. Prices are firm at 2.05c., Chicago.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Ferroalloys.—This market remains quiet, except for a few scattered quotations for less than carload lots. Prices are firm.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Sheets.—Uneasiness in prices for sheets is not shown in the immediate Chicago district. To the southwest and southeast, however, quotations are weak. Third quarter contracting continues, and a substantial volume of spot orders is being forwarded by users. Output is close to 85 per cent of capacity, a condition still dictated by the supply of raw steel. The roofing trade, especially in the North and Northwest, is more active. The jobbing trade is unusually active in the turnover of sheets. It has bought sparingly for the third quarter for the reason that a large part of second quarter contracts were not specified, and sellers are now allowing jobbers to draw against the old commitments.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—Orders for cast iron pipe are scarce in the immediate Chicago territory. Outlying districts are bringing some business into the market, and there is a limited amount of private buying, though the bulk of this is in orders of car lot size. A Des Moines, Iowa, contractor has been awarded a general contract to lay 125 tons for Grand Rapids, Mich. Royal Oak, Mich., will take bids July 15 on 9600 ft. of 6-in. and 7800 ft. of 8-in. pipe. West Allis, Wis., is taking bids this week for the construction of 3200 ft. of 24-in. cast iron water main.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Bars.—New buying in mild steel bars is unusually heavy, as many users enter the market for third quarter requirements. The total of contracts at this time is fully on a par with the tonnage taken for the second quarter, while some buyers, anticipating steady use in the summer months, have signed contracts larger than those made for the second three months of this year. Specifications for the week are down a trifle, but in the aggregate they compare favorably

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.
Reinforc'g bars, billet steel	2.10c. to 2.40c.

Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

with shipments. As far as can be ascertained, stocks in the hands of users are small. Deferred deliveries have caused buyers to anticipate their needs farther in advance and mills are having less difficulty in arranging rolling schedules. Some automobile specialty manufacturers are taking larger quantities of bars as they prepare to furnish parts of new models. Prices for mild steel bars are steady at 2.05c. a lb., Chicago. Spot buying in alloy steel bars is active and prices are firm. Demand is steady and specifications are equal to shipments, which represent 85 per cent of local mill capacity. The iron bar market is steady because of a uniform demand from railroads. Prices are firm at 2.05c. a lb., Chicago. Specifications for rail steel bars are larger than shipments and deliveries range two to three weeks. The bed industry is active. Barn equipment manufacturers are enjoying an active early summer business.

Bolts, Nuts and Rivets.—The average of output in this district was cut temporarily this week because several plants were down for inventory taking. Shipments, partly drawn from stocks, were at a uniform rate. Demand by the railroads is reported good for this time of the year.

Reinforcing Bars.—This market is quieter than it was a week ago. Dealers estimate that inquiries on hand are fully 30 per cent smaller in aggregate tonnage than they were a year ago at this time. Fresh inquiries this week are few in number and for the most part small in tonnage. This is contrary to the experience in previous years, when interest in buying usually expanded in July. Deliveries from mills still are unsatisfactory to dealers who have not held large stocks and who have had no opportunity to expand them in recent months. The market is highly competitive, and prices lack strength. Bar shops are moderately well engaged on a large number of small orders.

Wire Products.—A seasonal lull is keenly felt in wire products. New buying is dull and specifications for most products and from a large number of buyers are measurably smaller than a week ago. This situation, sensed by producers about 10 days ago, has not led to curtailment of output. Stocks at mills have been growing smaller all through the spring and early summer months, and it seems likely that mills will maintain output at 65 per cent for some time to come, while stocks are being rounded out for the fall trade. Prices are steady on all products, with the exception of nails, on which weakening in quotations has spread over much of the Central West. Jobbers, taken as a whole, are specifying freely for this time of the year. In some quarters it is expected that not much greater recession in orders will be experienced from the manufacturing trade. To strengthen this opinion, sellers point to added activity of automobile parts makers, who are now manufacturing for new automobile models that soon are to make their appearance.

Cold-Rolled Strip. — Specifications for this commodity are liberal and operations are near capacity. Delivery promises are still close to six weeks. Manufacturers of automobiles in the medium-price field are now taking this commodity for use in new models.

Rails and Track Supplies.—The Great Northern is inquiring for 30,000 tons of standard-section rails. Other miscellaneous requests for prices from Northwestern railroads total 5000 tons. Rolling programs on old contracts have now been arranged, and local mills have settled to an even pace for the completion of these obligations. New orders for track supplies total 3500 tons, and inquiry is for not less than 8000 tons, including 5000 tons, which is still open for the Pennsylvania. Light rails are in moderate demand. Rail mills are operating at 85 per cent of capacity and accessory departments are engaged at 75 per cent.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Coke.—By-product foundry coke is firm at $8 a ton, Chicago ovens. Shipments have remained uniform in the first 10 days of July.

Old Material.—Shipments against old orders are large and well up to the average of recent weeks. Most users, with the possible exception of some foundries, continue to operate near the rate maintained in June. Brokers' obligations are large, and, with the new buying lacking, they are concentrating on filling old orders as fast as buyers will accept shipments. Incoming scrap balances well with current demand, and little trouble is being experienced with scrap appearing on track. There is one exception, however, to this and that is the fact that several mills have placed embargoes against hydraulic compressed bundles. Brokers, having no place to consign this grade, are not taking it out of yards, and dealers are being forced to pile bundles as they are made. Prices for cast grades are weak and demand is light, partly because last week many foundries closed for the full six days. Lists are being offered this week by the Missouri-Kansas-Texas, Santa Fe, Wabash, Great Northern and the Pullman Car & Mfg. Corporation.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$14.75 to $15.25
Shoveling steel	14.75 to 15.25
Frogs, switches and guards, cut apart, and misc. rails	16.25 to 16.75
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.00 to 13.50
Forg'd cast and r'l'd steel carwheels	18.25 to 18.75
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.75 to 17.25
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	9.75 to 10.25
Short shoveling turnings	9.75 to 10.25
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.75 to 17.25
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Iron Ore Imports Continue Heavy in May

WASHINGTON, July 6. — May imports of iron ore, while less than those for April, continued the heavy movement of the past few months. The total was 275,762 gross tons, compared with 284,134 tons in the preceding month and with 211,270 tons in May, 1928. For the five months the imports reached 1,223,783 tons, which is 13½ per cent higher than the total for the like period of last year.

Chile furnished a little less than half of the total imported in May. For the five months of the year, however, Chile's contribution was almost 53 per cent.

SOURCES OF AMERICAN IMPORTS OF IRON ORE
(In Gross Tons)

	May		Five Months Ended May	
	1929	1928	1929	1928
Canada	5	290	167	42,423
Cuba	56,400	33,000	269,900	164,786
Chile	130,316	141,800	646,085	624,700
Spain	13,048	.....	31,416	5,250
Sweden	22,723	.....	95,751	19,614
French Africa	25,800	34,375	84,980	194,021
Other countries	27,470	1,805	95,484	28,726
Total	275,762	211,270	1,223,783	1,079,520

New York

Structural Steel Market Active—Pig Iron Inquiries Increase—Scrap Exported to Japan

NEW YORK, July 9.—Foundry iron consumers in this district show no haste in covering their future requirements, in most cases having sufficient tonnage on hand or coming in on contracts to carry them well through the current month. Inquiry however, has increased, and upward of 8000 tons of business is in the market. Sales in the past week were about 5000 tons. Southern pig iron is not providing much competition in this district, but there is an increasing movement of Buffalo iron by barge to Central Railroad of New Jersey docks at Jersey City, where it is transferred to cars for rail delivery. Barge freight rates from Buffalo to New York were maintained at about $2.50 a ton in the spring, but, with barge operators facing competition from a low, all-rail rate to the East on grain, they are more inclined to book pig iron at rates of $2.25 a ton or less. The General Fire Extinguisher Co., Providence, R. I., has closed on about 2500 tons of foundry iron, about half with a New England furnace and the rest divided between a New York State furnace and Buffalo furnaces. The inquiry of the National Radiator Co., Johnstown, Pa., for 3500 tons of foundry iron for delivery to Trenton, N. J., is not yet reported closed, and another radiator manufacturer has about 4000 tons pending for shipment to plants outside the district. About 2000 tons of foundry is still to be bought by the Chapman Valve & Mfg. Co., Indian Orchard, Mass. The Bureau of Supplies and Accounts, Washington, will open bids July 23 on 15 tons of No. 1 and No. 3 foundry for Portsmouth, N. H., 95 tons of No. 2 and 3 foundry for the Boston Navy Yard, 100 tons of No. 2 and 3 foundry for the Philadelphia Navy Yard, 224 tons of No. 1 foundry for the Norfolk Navy Yard, and 25 tons of No. 3 foundry for Charleston, S. C. Buffalo furnaces are quoting $18 a ton, base, but while prices show greater firmness, $17.50 per ton, furnace, has not entirely disappeared.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	21.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.89 to 23.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Jobbers report a slight slackening of business since the first of the month, but attribute this in part to the holiday. Structural shapes are in fair demand, and prices are well maintained. Galvanized sheets are active, but prices are still subject to occasional concessions of $1 or more a ton, and some shading is also reported on black sheets.

Cast Iron Pipe.—Prices quoted at recent openings of bids by municipalities show no tendency of the market to advance. Hartford, Conn., has opened bids on about 160 tons of 6, 8 and 12-in. water pipe. A Southern maker was low on about 85 tons of 6 and 12-in. pipe, and a Northern foundry was low on 75 tons of 8-in. The low bid on 370 tons of 8 and 12-in. pipe and 12 tons of fittings for Weston, Mass., was submitted by a Northern maker. Current buying of gas and water pipe is in most instances limited to small tonnages of about a carload to complete installations.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $33.60 to $35.60; 4-in. and 5-in., $36.60 to $38.60; 3-in., $43.60 to $45.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—The lull in buying continued the past week, and no sales or fresh inquiries of consequence are reported. Quotations, however, remain steady and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Ferroalloys.—Sales of several carloads and small lots of spiegeleisen are noted for early delivery at $34, furnace. There is almost no new demand for ferromanganese, but specifications on contract for both of these alloys are exceedingly heavy. This is also true of ferrosilicon and standard ferrochromium. Production of ferromanganese in June at 33,363 gross tons, according to returns to THE IRON AGE, was the largest since November, 1918, and brings the average output for the first six months to 26,700 tons a month, as compared with 26,000 tons a month in all of 1928.

Finished Steel.—The volume of buying of structural steel and plates continues at a high rate, although there has been a decided let-down during the past week in orders and specifications for most of the other forms of finished steel. A leading producer of structural shapes says that the volume of business in sight is in unprecedented amount, so that the third quarter "promises to be one of sustained high activity, rivaling the high mark during the second quarter." Awards of the week in New York included 6000 tons for the Downtown Athletic Club, 4100 tons for one telephone building and 2000 tons for another, and 4000 tons for catenary bridges for the Delaware, Lackawanna & Western Railroad. Outstanding new projects are 6000 tons for an apartment building, 2500 tons for a bank building and 3000 tons for an automobile plant, the latter to be built by the Chevrolet Motor Co. at Tarrytown, N. Y. Fabricated steel lettings in the New York metropolitan area in June amounted to 46,899 tons, compared with 34,575 tons in

Warehouse Prices, f.o.b. New York

	Base per Lb.
Plates and structural shapes	3.30c.
Soft steel bars, small shapes	3.25c.
Iron bars	3.24c.

May, states the Structural Steel Board of Trade. The total for the first half of the year was 243,285 tons, as against 182,800 tons in the corresponding period of 1928, a gain of approximately 33 per cent. These figures do not include subways, bridges and similar engineering work. Weakness in prices has developed on wire nails and galvanized sheets. On nails the $2.75 per keg price has virtually disappeared, and there have been concessions from $2.65. Galvanized sheets have been sold to jobbers at 3.50c., Pittsburgh. Otherwise the price situation seems to be fairly steady.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Demand for foundry coke is good, especially for by-product, but Connellsville furnace coke is quiet at $2.75 to $2.85 per net ton, ovens. Special brands of beehive coke are $4.85 a net ton, ovens, or $8.56, delivered to northern New Jersey, Jersey City and Newark and $9.44 to New York and Brooklyn. By-product coke is quoted at $9 to $9.40 per net ton, Newark or Jersey City and $10.06, New York or Brooklyn.

Old Material.—The only active grades of scrap are No. 1 and No. 2 heavy melting steel. In the past fortnight a substantial tonnage of both grades has been shipped for export to Japan, and brokers with these contracts are still buying for such shipment. The buyer specifies that at least half the cargo must be strictly No. 1 heavy melting steel, but the rest may be No. 2 and not more than a small percentage of what is classified as No. 3 steel. Brokers buying No. 1 steel for eastern Pennsylvania delivery are paying $16 a ton for shipment to Bethlehem, Pa., $16 to $16.25 per ton, delivered Claymont, Del., and $16.50 per ton, delivered Coatesville, Pa. No. 2 heavy melting steel is being bought at $13.50 to $13.75 a ton, delivered eastern Pennsylvania. Stove plate to local foundries is off slightly, with dealers paying $10 a ton, delivered, to a consumer at Mahwah, N. J. Specification pipe is off 50c. a ton on the basis of a recent sale to a Lebanon, Pa., consumer at $15 a ton, delivered.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.50 to $13.35
Heavy melting steel (yard)	8.00 to 9.50
No. 1 hvy. breakable cast.	10.75 to 12.00
Stove plate (steel works).	7.75 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.25 to 7.50
Short shoveling turnings..	7.25 to 7.50
Cast borings (blast furn. or steel works).....	7.00 to 7.25
Mixed borings and turnings	6.75 to 7.25
Steel car axles.....	19.25 to 19.75
Iron car axles.....	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.50 to 10.00
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.00 to 13.50
Cast iron carwheels.....	12.25 to 12.50
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad)..	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Cleveland

Mill Committed Into August in Heavy Tonnage Lines—Specifications for Sheet Products Lighter

CLEVELAND, July 9.—Specifications and new business in all lines of finished steel declined during the week. The falling off in orders was probably partly due to the holiday. The seasonal slowing down of the automotive industry is reflected in lighter specifications for steel bars, sheets and strip steel from local forging and stamping plants, some of which have discontinued night operation. Production by some of the automobile manufacturers will be light for a few weeks until they bring out new models. However, the slowing down of the demand for steel from this industry probably will be less than usual in July and August. Previous output records for the two months are expected to be broken because of the heavy production schedules of the two largest manufacturers of low priced cars, the Ford company, which is still increasing its output, and the Chevrolet company, which has made only a small reduction in its production schedule.

Delivery of steel bars, plates and structural shapes show little, if any, improvement. Most mills are fully committed for three or four weeks, or with enough tonnage to carry them into August. Some cannot promise shipments of angles in less than eight to ten weeks.

The Wabash Railroad has placed a car ferry with the Toledo Shipbuilding Co. This will require 2500 tons of plates, which will be supplied by a Pittsburgh district mill. The Ralston Steel Car Co., Columbus, is inquiring for 6500 tons of plates for 800 box cars it recently took for the Pennsylvania Railroad.

Activity in the building field has declined sharply and few jobs are in prospect.

There is some irregularity in steel bars in the local market, Cleveland mills going in some cases to 1.90c., mill, for local delivery, necessitating an outside mill price of 1.92½c. delivered, Cleveland, to meet local competition. For outside shipment 1.95c., Cleveland, appears to be firmly maintained.

On plates and structural material 1.95c., Pittsburgh, is the ruling quotation.

Pig Iron.—The market was duller the past week than for some time, evidently because of the holiday. Sales by Cleveland interests totaled barely 10,000 tons in foundry and malleable grades. Inquiry is light. Many of the smaller Ohio foundries still have enough iron due on second quarter contracts to last them about a month and will not buy until their present contracts are cleaned up, as they see no prospect of higher prices. Merchant furnace interests are now wondering whether the demand of the open-hearth furnaces will decrease during the summer to an extent that steel makers will have pig iron to sell. Producers have added somewhat to their depleted stocks as a result of the decreased demand in June. Shipments to some of the large consumers in the automotive field are expected to show a gain this month over June. On the other hand, shipping orders from some of the Ohio foundries for July have declined. A 50c. reduction on Southern foundry iron to $14.50, Birmingham, is announced, and this cut will make Southern iron more of a competitive factor against Lake iron in the southern and central part of Ohio. Local prices are unchanged at $18.50, furnace, for foundry and malleable iron for outside shipment and $19 for local delivery. Both grades are quoted at $20, furnace, for Michigan delivery.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25....	20.50
Malleable	19.50
Ohio silvery, 8 per cent...	20.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley..	$26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—The leading local producer has covered practically all of its consumers for sheet bars, billets and slabs for the third quarter at $35, Cleveland, Youngstown or Pittsburgh, this being an advance of $1 a ton over the second quarter price for billets and slabs. However, shipments of billets and slabs are still being made against $34 second quarter contracts, although these will be cleaned up shortly. Specifications have fallen off somewhat and the pressure for deliveries that existed a short time ago is no longer in evidence.

Sheets.—The market was dull the past week, both in specifications and in new business. While deliveries have generally improved, some of the mills have enough business on their books to keep them operating at capacity for five to six weeks. Although the easing up in specifications is more noticeable on full finished

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.

Com. wire nails, base per keg.....	2.95

*Net base, including boxing and cutting to length.

sheets than on other grades, the capacity of mills making wide auto body sheets is still well taken up and specifications have been issued for the wide material for deliveries as far extended as October. There are no new developments in the price situation. Price shading is rather common on black sheets to 2.85c. and on galvanized to 3.60c., Pittsburgh. Blue annealed sheets and blue annealed light plates are firm.

Iron Ore.—With all previous shipping records broken in the three months since the opening of navigation, the movement of ore shows no decrease this month. Nearly all the ore is going directly to furnaces. The dock balance July 1 was 4,082,400 tons as compared with 5,050,692 tons on the same date a year ago. Receipts at Lake Erie ports until July 1 were 14,928,976 tons as compared with 11,712,316 tons for the same period last year. Shipments from these ports to furnaces during the same period were 11,793,868 tons as against 9,326,909 tons for the same period last year.

Wire Products. — Manufacturers wire continues to move fairly well, although in not so good volume as recently. A slight slowing down of the bolt and nut industry has caused a decrease in the demand from that source. Regular prices on both nails and wire appear to be generally maintained in Cleveland, but prices are reported to be spotty in some of the competitive points.

Warehouse Business.—Orders show a moderate decline on all lines as compared with last month. New extras on blue annealed sheets are being maintained. Prices on black and galvanized sheets are holding well in spite of weakness of mill prices. Other prices are firm.

Strip Steel.—Specifications for both hot and cold-rolled strip steel were light the past week, and deliveries have materially improved except on very narrow hot strip or material 2 in. and less in width. Delivery promises on wide strip are from two to five weeks. Prices are firm. Some of the mills have become well caught up with deliveries on cold-rolled strip, and the 2.75c., Cleveland, price has become more common, mills finding it more difficult to get 2.85c. for small lots.

Coke.—Some third quarter contracts for by-product foundry coke were placed during the week subject to monthly price adjustments. This coke is quoted at $8.25, Painesville, for July shipment. By-product coke for domestic use shows more life than recently. The price is unchanged at $4.50, ovens, and $6 for Cleveland delivery. A price advance of 25c. a ton is reported in Detroit.

Old Material.—The market was very dull the past week. No lots of any size were purchased by mills. With shipments to local mills greatly restricted, dealers are not buying steel-making scrap for Cleveland delivery. As a result, considerable scrap is backing up in producers' and dealers' yards. Local quotations are unchanged, but there is not enough business in steel-making grades to test prices. Dealers are paying $11 for small lots of blast furnace scrap. There is a fair demand for steel-making scrap from the Youngstown district, and dealers are paying $17.50 for No. 1 heavy melting steel and $17 for compressed sheet steel for delivery to that district.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	14.50 to 15.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.25 to 9.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50

Philadelphia

Mill Operations Slacken—Railroads to Ask Suspension of Birmingham Rail and Water Rates

PHILADELPHIA, July 9.—Steel mill operations have been slightly reduced since the beginning of the month, partly because of a smaller volume of specifications on contracts and partly because of warm weather and need to repair equipment. Consumers, however, have only small stocks of material, and those who are specifying as a rule press for prompt delivery.

Except on black and galvanized sheets, prices are well maintained. The recent opening of bids by the Pennsylvania Railroad on 300,000 tie plates and 10,500 kegs of spikes brought out quotations of $2.80 per 100 lb. for ordinary spikes, $2.95 per 100 lb. for copper bearing spikes and $51 per ton for heavy duty copper bearing tie plates, all f.o.b. Pennsylvania Railroad at manufacturer's plant.

Inquiry for pig iron is improving, but sales of Birmingham iron in this district are still rather limited. Eastern railroads are preparing a petition to the Interstate Commerce Commission requesting suspension of the rail and water rates from Birmingham to Atlantic Coast ports, which were to be effective early in August. Should the petition be granted a long delay in applying these rates may ensue.

Pig Iron.—Birmingham foundry iron is being offered to consumers in eastern Pennsylvania at $14.50 per gross ton, furnace, and basic at $13.50 per ton, furnace. Although a rail and water freight rate, via Savannah, of $5.25 per ton, loaded on cars, Philadelphia, has been granted to become effective early in August, sellers of Birmingham iron are not quoting delivered prices on this rate, as eastern railroads are preparing a petition to the Interstate Commerce Commission which may delay its application for six to seven months pending an investigation by the commission. When encountering competition from Southern iron quoted at $20.87 per ton, delivered, on an all-rail rate of $6.37, or $19.64 per ton, alongside dock, Philadelphia, eastern Pennsylvania furnaces have only found it necessary to shade $21.50 per ton, delivered, by about 50c., as most small foundry users are unwilling to change the brand of their iron unless the saving is considerable. Among current inquiries is 1500 tons of cylinder iron for the Baldwin Locomotive Works, which was bought from an Alabama furnace on two previous orders for cylinder and floor iron. The Bureau of Supplies and Accounts, Washington, opens bids July 23 on about 400 tons of foundry iron for Navy Yards on the Atlantic Coast, and is also inquiring for small lots of iron for Puget Sound Navy Yard and for shipment to Cavite, Philippine Islands. The Panama Canal Commission is inquiring for about 100 tons of low phosphorus iron. The Consolidated

Machine Tool Corporation, Rochester, N. Y., has bought 600 tons of foundry iron for its Hilles & Jones plant from an eastern Pennsylvania furnace.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.76 to $22.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	22.26 to 22.76
East. Pa. No. 1X	22.76 to 23.26
Basic (del'd east. Pa.)	20.25 to 21.00
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Billets.—Contracts have been made at $35 per ton, Pittsburgh, for rerolling billets and $40, Pittsburgh, for forging quality. An effort to maintain forging billets at $41, Pittsburgh, or $6 a ton more than rerolling quality, has been abandoned.

Bars.—Deliveries range from two to three weeks with most mills, and prices are firm at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia. Operating rates of mills have receded slightly from the high level of the past quarter, partly because of the slackening of demand from automobile manufacturers.

Reinforcing Bars.—Projects requiring reinforced concrete are increasing and competition for tonnage is keen. About 400 tons of bars are still pending for a bridge over the Raritan River, and the building for the Woman's Medical College and Hospital in Philadelphia requires a substantial tonnage of bars. Billet steel bars are quoted at 2c. to 2.05c., Pittsburgh, or 2.32c. to 2.37c., delivered Philadelphia, by Pittsburgh mills. Occasionally eastern Pennsylvania mills rolling billet steel bars have quoted as low as 1.95c., Pittsburgh, or 2.27c., Philadelphia, without the usual extra of $5 a ton for cutting to length. Rail steel bar sellers quote about 1.95c. per lb., Franklin, Pa., or Tonawanda, N. Y., with no extra for cutting to length.

Shapes.—Prices continue irregular, ranging from 1.95c. to 2c., f.o.b. nearest mill to consumer, or 2.01c. to 2.06c., delivered Philadelphia. Occasional small tonnages bring up to 2.05c., mill, or 2.11c., Philadelphia. Fabricating shops are well booked with tonnage, especially bridge work. The Pennsylvania Railroad opens bids July 25, on two bridges over the Hackensack River at Marion, N. J., requiring about 14,000 tons. Two office buildings in Philadelphia will require about 4000 tons of fabricated steel.

Plates.—Car builders and the railroads are providing the greater part of the tonnage being rolled at present, but some substantial orders from shipyards are still pending award. About 4000 tons of plates will be required for each of the cruisers to be constructed by the New York Shipbuilding Corporation, Camden, N. J., and the Philadelphia Navy Yard. Plates are quoted at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Old Material.—All grades of scrap are inactive, but No. 1 heavy melting steel is evidently stable at $16.50 per ton, as brokers with contracts are paying up to $16.50 to secure sufficient material. Heavy breakable cast is slightly stronger, a sale having been made last week at $15.25 per ton, delivered. Cast iron carwheels also show an advance in price, following sales at $16.50 and $16.75 per ton, delivered to eastern Pennsylvania consumers.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50
Scrap T rails	16.00
No. 2 heavy melting steel	$12.50 to 14.00
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.00 to 15.25
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	11.50 to 12.00
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	20.00 to 21.00
Rolled steel wheels	20.00 to 21.00
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 16.75
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Sheets.—Black and galvanized sheets are being quoted at 2.85c. to 2.90c., Pittsburgh, or 3.17c. to 3.22c., Philadelphia, for black, and 3.60c. to 3.65c., Pittsburgh, or 3.92c. to 3.97c., Philadelphia, for galvanized. Blue annealed sheet prices are unchanged at 2.35c. per lb., Pittsburgh, or 2.67c., Philadelphia, for No. 13 gage, and light plates, blue annealed, are quoted at 2.10c. to 2.20c., Pittsburgh, or 2.42c. to 2.52c., Philadelphia, for No. 10 gage. The practice of granting reductions of as much as $2 a ton to large warehouse distributers has been renewed recently by some sellers of sheets, but blue annealed have apparently not been subject to such reductions except where they were included in an assortment bought by a jobber.

Imports.—In the week ended July 6, pig iron arrivals at this port totaled 805 tons of which 755 tons was from British India and 50 tons from the Netherlands. A total of 33 tons of manganese ore was received from Germany, and 40 tons of ferromanganese arrived from the United Kingdom. Steel imports consisted of 35 tons of steel bars, 53 tons of steel scrap and 112 tons of structural shapes from Germany and 475 tons of structural shapes from Belgium.

Advances on Some Grades of Scrap in Detroit

DETROIT, July 9.—Owing to the fact that several of the large mills and furnaces have come into the market, long turnings and new No. 1 busheling advanced 50c. a ton during the past week, with heavy melting and shoveling steel, hydraulic compressed, sheet clippings and flashings showing a 25c. rise.

Pig iron shipments are somewhat lower for the month in the district, but are equal to production of the furnaces supplying the Michigan melters.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	12.75 to 13.25

Steel Frame Houses to Be Built in South America

Materials for five steel frame houses have been assembled and shipped to Cartagena, South America, by the Broderick Firesafe Homes Association, New York. These houses, which are to be erected in a suburb of Cartagena by the National Construction Co. of that city, are designed to be not only fire-safe, but also quake-safe, and proof against attacks of white ants, an item of major importance in southern countries. In addition to the steel frame work and roof and floor members, the wire lath, plumbing fixtures and equipment, lighting and wiring equipment, hardware, woodwork, wrought iron, fencing and piping were included in the shipment.

MOVEMENT OF LAKE SUPERIOR ORE, IN GROSS TONS

	June, 1929	June, 1928	Season to July 1 — 1929	Season to July 1 — 1928

Pacific Coast

Bids Opened on 10,000 Tons of Plates for Seattle Pipe Line —Holiday Checks Trade

SAN FRANCISCO, July 6 (*By Air Mail*).—Trading in iron and steel products this week was interrupted to some extent by the holiday. A number of plants shut down Wednesday night until the end of the week. The most important development of the week was the opening of bids on the Cedar River pipe line project at Seattle, involving 10,000 tons of plates. The price structure continues to hold to the levels established some time ago.

Pig Iron.—Little of importance has come into the market during the past week. Buying is confined to immediate needs. Prices are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy. sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing steel bars this week exceeded 2300 tons and included 900 tons for the City-County Building addition, Seattle, and 200 tons for the Aeronautic Hall for the University of Washington, Seattle, both placed with the Northwest Steel Rolling Mills. The Pacific Coast Steel Co. took 500 tons for a store in Spokane and 150 tons for highway work for the State of Washington. Bids were called for this week on 1225 tons for the West Garfield Street bridge in Seattle. Pending business makes a fair tonnage. No change in out-of-stock quotations is noted in the San Francisco district, 2.30c., base, applying on carload lots and 2.60c. on smaller tonnages. Los Angeles prices continue at 2.40c., base, on carload lots and 2.70c. on less than carload lots. Merchant bar steel is firm at 2.35c., c.i.f. Coast ports.

Plates.—Only one award in excess of 100 tons was reported. This called for 110 tons for a penstock for the Cushman Dam project at Tacoma and was booked by the Seattle Boiler Works. Bids were opened this week on 10,000 tons for the Cedar River pipe line. Other pending business is confined to small tonnages. Prices remain firm at 2.35c., c.i.f.

Shapes.—Activity in the structural steel market this week was broken into by the holiday, and as a result awards were not numerous. The McClintic-Marshall Co. secured 600 tons for an exhibit building for Los Angeles County at Pomona and the Moore Dry Dock Co. secured 300 tons for a hospital at Eureka, Cal. The largest new inquiry involves 1375 tons for the West Garfield Street bridge, Seattle, bids on which open Aug. 2. Bids are being taken on 110 tons for a hangar in Seattle and on 150 tons for the Cushman Dam project, Tacoma. Plain material continues firm at 2.35c., c.i.f.

Cast Iron Pipe.—Cast iron pipe bookings exceeded 2700 tons. Los Angeles placed 1425 tons of 8-in. Class B pipe with the American Cast Iron Pipe Co. and 1148 tons of 24-in. Class C pipe with the same company. Argentieri & Colorossi secured 224 tons of 12-in. Class D pipe for Seattle. Los Angeles placed 208 tons of 4-in. Class C pipe with B. W. Kuhn Co. The United States Pipe & Foundry Co. was low bidder on 260 tons of 12-in. pipe for the East Bay Municipal Utility District, Oakland. The Daley Corporation was low bidder on 199 tons of 4 to 10-in. Class C pipe for San Diego. Great Falls, Mont., will open bids on July 8 for 162 tons of 6 and 8-in. Class B pipe, and Newport Beach, Cal., is calling for bids, to be opened July 15, on 724 tons of 4 to 12-in. Class B pipe.

Steel Pipe.—Movement of standard steel pipe recently has been confined to unimportant tonnages for the most part. The Huntington Iron Works secured 142 tons of 8-in. standard black pipe for the La Canada Irrigation District, La Canada, Cal. Los Angeles placed 227 tons of ¾ to 2-in. galvanized standard pipe with the Santa Fe Pipe & Supply Co. No large pipe line inquiries have come up recently. The 2263-ton inquiry of the Pacific Gas & Electric Co., San Francisco, for 8⅝-in. O. D. gas pipe for installation in Monterey, Gilroy and Salinas is still pending.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Prices Reduced to a $14.50 Base—Now at Lowest Point Since 1916

BIRMINGHAM, July 9.—Effective last week, pig iron prices were reduced to $14.50, base, from $15. This is the second reduction of 50c. a ton in the past three weeks, as the price was reduced to $15 from $15.50 when books were opened for the third quarter on June 20. The new price of $14.50 is the lowest for Birmingham iron since September, 1916. Some sales have been made to outside points at the new price, but general buying has been held in check by the recent holiday period. Buying in the district has improved since the new price was announced, but the movement so far has not been important. A large part of the third quarter production is yet to be sold. Seventeen furnaces are active, this number having been in blast for several weeks. The No. 1 furnace of the Republic Iron & Steel Co. is to be blown out in about 30 days for repairs.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—Mills have entered the second half with more tonnage on the books than at this time in a number of years. The moderate let-up in new business during the last few weeks has checked the expansion in backlogs that had been continuous throughout the spring months, but they are only slightly reduced from what they were 30 days ago. Sheets were about the only important line to show improvement last week. All prices are the same. Structural steel fabricators are operating steadily at near-capacity rates. The Ingalls Iron Works Co. has booked an order for 2000 tons for the new steam power plant of the Georgia Power Co., near Atlanta, Ga. Twenty-two of a total of 23 open-hearths are active. The Tennessee company is working all of its eight at Fairfield and eight of nine at Ensley. The Gulf States Steel Co. has all six of its open-hearths at Alabama City in operation.

Old Material. — Buying is in small tonnages. There have been no price changes since the reductions reported last week.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	$10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

Cast Iron Pipe. — New business of pressure pipe manufacturers has been above the average for the past two weeks. The project at New Orleans, requiring 4650 tons of 36 to 42-in. pipe, went to the United States Pipe & Foundry Co. This company also received an order from Asheville, N. C., for over three miles of 18-in. pipe and shared in a tonnage from Los Angeles to the extent of several hundred tons. Small order business has a good aggregate of pipe tonnage. Oakland, Cal., will open bids July 10 for 2200 tons of pipe. Bids were opened July 5 for a project at Houston, Miss., requiring 5300 ft. of 8-in. pipe and 15,540 ft. of 6-in. pipe. Shipments have been exceeding production during the

past few days. Prices remain at $37 to $38 for 6-in. and larger sizes.

Coke. — The movement of foundry coke has declined, owing to the observance of the Independence Day holiday period. New business is quiet. Prices are unchanged from $5, base.

Youngstown

Mills Operating at High Average of June

YOUNGSTOWN, July 9.—Following suspensions last week for the holiday observance, iron and steel companies in northeastern Ohio resumed operations this week at a rate closely approaching the high June average. Schedules reveal an average operating rate of 85 to 90 per cent.

President James A. Campbell of the Youngstown Sheet & Tube Co. believes that fall steel buying will begin earlier this year than usual, and that steel companies will feel the effect of such buying by the middle of August.

President E. T. McCleary of the Republic Iron & Steel Co. says that July business is holding up "surprisingly well" and much better than anticipated.

The Republic company is operating one machine for the manufacture of steel pipe by the electric welding process, producing tubing up to 7 in. in diameter, and is installing two additional machines to roll larger pipe.

The company is converting sheet mills at its Warren plant into tin mills and is installing modern heating furnaces. Plans are being completed for the electric power plant for the Youngstown property, designed to utilize waste gases from the blast furnaces. Electric drives are to be installed for the blooming mills.

The Liberty tin mills at Leavittsburg of the Republic Iron & Steel Co. resumed after five weeks' suspension.

The West Leechburg Steel Co., Leechburg, Pa., will install an electric drive on its new 12-in. hot strip mill, which replaces an old Belgian type mill. The motor equipment will be furnished by the Westinghouse Electric & Mfg. Co., East Pittsburgh.

St. Louis

Pig Iron Sales Improve but Uncertain Price Situation Checks Buying—Steel Demand Brisk

ST. LOUIS, July 9.—An improvement in pig iron sales during the week is reported. The St. Louis Gas & Coke Corporation sold 6100 tons, including 3000 tons of basic to an East Side melter, and 1000 tons of foundry to a local jobbing foundry; 500 tons to a Belleville stove foundry and 500 tons to a local jobbing foundry, all for third quarter shipment. As a whole, buying for third quarter has been very light, uncertainty as to the price situation caused by a second reduction of 50c. a ton by Alabama furnaces being one of the reasons assigned for the hesitancy by melters. Local makers have made no change in their prices, although it is reported that competition has been met in some instances. Southern iron is now on a $14.50 base. Most melters in the district closed their plants over the Fourth.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—Sales of the Granite City Steel Co. for June were 45 per cent ahead of sales for June, 1928. Demand is exceedingly brisk for this time of year. Plates and blue annealed sheets are in greater demand than other flat-rolled products. Prices are said to be well maintained. Second quarter prices for plates, shapes and bars have been continued, and unexpired contracts are being carried over into the third quarter because of the inability of mills to make full deliveries. The structural steel trade continues dull. The Laclede Steel Co. was awarded 365 tons reinforcing bars for a hospital addition. The only new reinforcing job of consequence pending is a grain elevator for the Chicago, Burlington & Quincy Railroad, 500 tons.

Old Material.—Shipments of scrap by country dealers are light, and railroads are behind in their deliveries of items sold, with the result that dealers here are short against their contracts with the mills. It is said that the mills are willing to buy, but dealers are unwilling to sell at present levels. Cast iron car wheels are down 25c. a ton and stove plate is $1 higher. Otherwise prices are unchanged. Railroad lists: Baltimore & Ohio, 20,000 tons; Wabash, 3000 tons; Great Northern, 2500 tons; Texas & Pacific, 900 tons; Chicago & Eastern Illinois, 600 tons; Ann Arbor, 200 tons; New Orleans & Great Northern, 150 tons; Southern Pacific, 25 miles of 50 lb. rail.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.50 to $14.00
No. 2 heavy melting or shoveling steel	12.75 to 13.25
No. 1 locomotive tires	15.00 to 15.50
Miscel. stand-sec. rails including frogs, switches and guards, cut apart	15.50 to 16.00
Railroad springs	17.00 to 17.50
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.50 to 14.00
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	16.00 to 16.50
Machine shop turnings	8.00 to 8.50
Heavy turnings	9.75 to 10.00
Steel car axles	19.00 to 19.50
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.50 to 18.00
Steel angle bars	14.25 to 14.75
Cast iron carwheels	14.00 to 14.50
No. 1 machinery cast	15.50 to 16.00
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	15.00 to 15.50
Stove plate	12.50 to 13.00
Agricult. malleable	15.00 to 15.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Buffalo

Operations of Steel Mills Show No Slackening—Pig Iron Buying Chiefly in Small Lots

BUFFALO, July 9.—Buying of pig iron has been accumulating in small orders, but there has been no sizable tonnage placed here during the past week. A New York State melter is inquiring for 1500 tons of foundry and malleable and another is seeking 1000 to 1500 tons of foundry and malleable. From New England comes an inquiry for 1000 tons of foundry. The Buffalo price in the East is $18 to $18.50, furnace, with $18 being done in a good many instances where tonnage of any considerable size is involved. It is understood that a good deal of the business that is offering is going to Port Henry or Mystic. Port Henry is asking $18 to $18.50, base, for New England delivery, but has a $3.66 freight rate, as against the freight rate from Buffalo of $4.91. Some sellers are inclined to think that the major portion of the buying of pig iron has been done and that there will be little of a pronounced movement until the fall, while others think that there is a considerable tonnage to be purchased for the current quarter.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Business continues good in all lines, and operations of local mills show no slackening. There has been a curtailment of production at the American Radiator Co. plant because of a midsummer shutdown. Fabricated structural awards include two new schools at Lockport, N. Y., calling for 100 tons. The reinforcing bar market is more active. Another section of the Hertel Avenue sewer is being figured, involving 300 tons. Bids go in this week for a new building for the Jamestown Telephone Co., which will require 150 tons of reinforcing bars.

Old Material.—An inactive condition has prevailed in this market, which is almost devoid of feature. The mills are busy and consumption of scrap is keeping up, but there has been no new buying of consequence. The only prospective purchase is one which will probably be made in the next two weeks by a large user of stove plate and No. 1 machinery cast.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$17.00 to $17.25
No. 2 heavy melting steel	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.75 to 15.00
No. 1 busheling	15.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	7.50 to 7.75
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth	
Knuckles and couplers	19.00
Coil and leaf springs	19.00
Rolled steel wheels	19.00
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades	
Short shov. steel turnings	12.00 to 12.50
Blast Furnace Grades	
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades	
No. 1 machinery cast	16.00 to 17.00
Stove plate	12.50 to 13.00
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.00 to 19.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades	
Industrial	18.50 to 19.00
Railroad	18.50 to 19.00
Agricultural	18.50 to 19.00
Special Grades	
Chemical Borings	12.50 to 13.50

American Hoist & Derrick Co., St. Paul, Minn., has opened a branch office and warehouse at 337 South Anderson Street, Los Angeles, Cal., in charge of W. H. Lummus, who has represented the company on the west coast for many years.

Black wire, base per 100 lb.	3.75

Boston

Low Prices Made on 2000 Tons of Pig Iron— Cast Iron Pipe Sales Increase

BOSTON, July 9.—The purchase of 2000 tons of pig iron, half No. 2X and half No. 1X, and 500 tons of malleable by a Providence, R. I., foundry in the past week was at low prices. The business was split four ways, according to report, 1000 tons of foundry and the malleable going to the Mystic Iron Works, 400 tons to a New York State furnace, and 400 tons to one and 200 tons to another Buffalo stack. Buffalo No. 2X was purchased at a little less than $17.50 a ton, furnace, New York State No. 2X at about $18 a ton, furnace, and Mystic No. 2X at less than $20 furnace. The delivered price on all iron bought was less than $22 a ton. Furnaces all quoted a 50c. a ton differential on No. 1X iron. The malleable iron, previously reported as for a Canadian subsidiary of the purchaser, is for Providence and was sold at around $23 a ton, delivered. In contrast with the Providence business, another large consumer closed on approximately 1000 tons of No. 2X and No. 1X at substantially higher prices. Sales otherwise were in small tonnages at prices equivalent to $18 a ton, base Buffalo. A Rhode Island foundry is in the market for 700 tons of No. 1X and 600 tons of No. 2X, and a Massachusetts plant for 1000 tons of No. 1X. Another 2000-ton Massachusetts inquiry probably will be closed next week.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.78 to $22.28
†Buffalo, sil. 2.25 to 2.75	22.28 to 22.78
*Buffalo, sil. 1.75 to 2.25	22.41 to 22.91
*Buffalo, sil. 2.25 to 2.75	22.41 to 22.91
East. Penn., sil. 1.75 to 2.25	24.65
East. Penn., sil. 2.25 to 2.75	25.15
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
Ala., sil. 1.75 to 2.25	21.41 to 23.27
Ala., sil. 2.25 to 2.75	21.91 to 23.77

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.
†Rail and water rate.

Reinforcing Bars.—The Concrete Steel Co. has taken 200 tons of billet steel bars for a local automobile service station, the largest transaction reported in some time. The market holds well at 2.66½c. a lb., base, from stock. The market for rail steel bars is inactive at 2.26½c., base, delivered common Boston freight rate points.

Shapes and Plates.—Fabricators took little work of consequence the past week, but are figuring on a fair amount of business. Competition among fabricators is still keen. Bids are being taken on a 3000-ton Boston office building.

Coke.—July shipments of by-product foundry coke from ovens to foundries to date are just about on a par with those of June. The price remains at $11 a ton, delivered, within a $3.10 freight rate zone.

Old Material.—The movement of scrap out of New England is freer, some Pennsylvania steel mills having rescinded holdup orders, but business is far from active. A further increase in shipments is expected, as all mills are now issuing shipping instructions. Materials are in limited supply and prices are quite firm. Exporters are scouring New England for scrap and may have to raise prices in order to load steamers scheduled to sail from here this month. Foundries are still absorbing a large weekly aggregate tonnage of textile and machinery cast.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.00 to $12.25
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.25
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.50 to 6.60
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	9.50 to 10.25
Forge flashings	10.00 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	8.75 to 9.00
Shafting	14.00 to 14.25
Steel car axles	17.00 to 17.50

Prices per gross ton deliv'd consumers' yards:	
Textile cast	$14.50 to $14.75
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.50 to 12.00
Railroad malleable	18.50 to 19.00

Cast Iron Pipe.—West Hartford will close bids on approximately 4500 tons of 36 and 42-in. pipe on July 17, and Hartford on 250 tons of 6, 8 and 10-in. Salem, Mass., has awarded 100 tons of 6 and 8-in. pipe to the United States Pipe & Foundry Co. Prices are steady on 4-in. pipe, but are at least $2 a ton lower on 6 to 12-in. and $3 or more on 16-in. and larger dimensions. Quotations made

openly are now: 4-in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12-in., $40.10 to $41.10; and 16-in. and larger dimensions, $39.10. A $3 differential is asked on Class A and gas pipe. During the first week in July one foundry booked 16,000 tons of pipe business, the largest amount taken in any one week by this company.

Cincinnati

Further Decline of 50c. a Ton on Southern Pig Iron Checks Buying—Sheet Mills Maintain Output

CINCINNATI, July 9.—Although the pig iron melt is reported to be heavy and district foundries are busy, the sales of iron in this market have declined noticeably, which may be a reflection of the uncertainty over prices resulting from a formal reduction of 50c. a ton on Southern iron, the second of this amount within three weeks. This brings Birmingham iron down to $18.19, delivered Cincinnati, for the base grade. Contrasted with this weakness is the firmness of Northern iron, on which quotations of $18.50, base, are apparently being maintained. Melters are taking iron on current contracts at a satisfactory rate, but are extremely conservative in placing new orders. Most of the sales are of small lots for immediate shipment. Aside from two private inquiries, there is no sizable business befor the trade.

Prices per gross ton, del'v'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	18.19
Ala. fdy., sil. 2.25 to 2.75	18.69
Tenn. fdy., sil. 1.75 to 2.25	18.19 to 18.69
S'th'n Ohio silvery, 8 per cent	27.89 to 28.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—Early July specifications for by-product foundry coke have been good, although new business consists wholly of spot orders from regular customers. Domestic coke prices have been increased 25c. a ton, effective July 15, making the new quotations for delivery at Cincinnati $6.25 for egg and $5.25 for walnut.

Finished Material. — Except for slight weakness in galvanized sheets in the South, where competition for roofing contracts has resulted in price concessions on quantity orders, sheets are still selling on a strong market. A slight decrease in bookings during the past week, due to the holiday, has not materially affected backlogs, and district sheet mills report that the continued heavy demand will maintain capacity production well into the future. Consumers are covered for third quarter needs and many are now specifying against new contracts, but deliveries are delayed six to seven weeks on heavy blue annealed and full pickled sheets and four to six weeks on light blue annealed and galvanized sheets. The demand continues to be diversified, with an increase in specifications for highway construction.

Old Material.—While consumers of scrap are taking shipments on old commitments, they are showing no haste to cover for the future, fresh bookings consisting of small orders for current needs. With dealers experiencing difficulty in obtaining good heavy melting steel, prices on this grade have been increased 25c., which, with the continued steadiness of prices on other grades, reflects the stability of this market. The usual monthly lists have been announced by the Southern Railway, Norfolk & Western, Louisville & Nashville and Chesapeake & Ohio.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.25 to $13.75
Scrap rails for melting	13.75 to 14.25
Loose sheet clippings	9.25 to 9.75
Bundled sheets	10.50 to 11.00
Cast iron borings	9.00 to 9.25
Machine shop turnings	8.50 to 8.75

Canada

Canadian Pacific Orders Rails From Algoma Mill—Steel Plants Maintain High Operating Rates

TORONTO, ONT., July 9.—Recent developments in the iron and steel industry of Canada indicate that the present high rate of operations will be continued for some months.

The Canadian Pacific Railway has awarded a substantial rail contract to the Algoma Steel Corporation, Sault Ste. Marie, Ont., which assures double shift rolling at the rail mill for an indefinite period. The rails are to be used in connection with the proposed five-year construction program of the Canadian Pacific in Western Canada.

The Canadian Pacific Railway has closed another contract with the Canadian Car & Foundry Co., Montreal, Que., for 100 steel cars.

Rail and rolling stock orders of a substantial nature are expected almost any time from the Canadian National Railways. This railroad also has an extensive program of extension mapped out for the Canadian West, and at the same time is making improvements to its Eastern lines and equipment.

Structural Steel.—While new business is not appearing in large volume, a steady flow of orders is reported for small tonnages. Structural steel awards for the past week were considerably below those of previous weeks. Fabricators, however, are carrying large tonnage backlogs, which will keep them running at capacity for a considerable period.

Pig Iron.—Following an active forward buying movement, which resulted in the majority of large melters covering for third quarter needs, new business is again beginning to lag. Some inquiry is still coming out for future delivery iron, but this is from small interests which were in no hurry to get their orders placed. Third quarter contracting compares favorably with that of the first and second quarter. Pig iron prices are firm.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00

Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Old Material.—The usual summer slump is now affecting the market, and, while new business is below that of a month or six weeks ago, it stands out well above that of any of the past summers. The demand for steel scrap has become almost a dead issue for the moment, although some deliveries are being made against old contracts. Prices are firm but unchanged.

Dealers' buying prices:

Fabricated Structural Steel

Non-Industrial Projects Predominate in Week's Lettings and in Fresh Inquiries

PROJECTS of a non-industrial character were predominant in the past week's structural steel lettings, which totaled about 45,000 tons. Apartment, office, club and school buildings took more than one-half of the tonnage. Structures of this type will require approximately 27,000 tons of the 49,000 tons of new work which appeared in the past seven days. Inquiries were the largest since the first week of June and indicate well sustained activity in the steel fabricating industry during the latter part of the year. Major awards included 6600 tons for two gas holders at Chicago, 6000 tons for an athletic club in New York, 5850 tons for a New York office building and 4100 tons for a telephone exchange building in New York. Among pending jobs are 14,000 tons for two bridges for the Pennsylvania Railroad, 8000 tons for the Cuneo Tower in Chicago and 6000 tons for an apartment building in New York. Awards follow:

STATE OF NEW HAMPSHIRE, 100 tons, highway bridges, to unnamed fabricator.

SALEM, MASS., 300 tons, theater, to New England Structural Co.

WALPOLE, MASS., 150 tons, manufacturing plant, to New England Structural Co.

GARDNER, MASS., 100 tons, hospital, to western Massachusetts fabricator.

CAMBRIDGE, MASS., 100 tons, four tanks, to Pittsburgh-Des Moines Co.

BRIDGEPORT, CONN., 1000 tons, power house, to Levering & Garrigues Co.

DELAWARE, LACKAWANNA & WESTERN RAILROAD, 4000 tons, catenary supports, to American Bridge Co.

NEW YORK, 6000 tons, Downtown Athletic Club, West Street, to Hedden Iron Construction Co.

NEW YORK, 4100 tons, telephone exchange building on West Fiftieth Street, to Hedden Iron Construction Co.

NEW YORK, 5830 tons, office building at Fifty-eighth Street and Fifth Avenue, to McClintic-Marshall Co.

NEW YORK, 3975 tons, Queensborough Bridge roadway, to American Bridge Co.

BALTIMORE & OHIO RAILROAD, 525 tons, bridge at Keys, W. Va., to McClintic-Marshall Co.

TRENTON, N. J., 1250 tons, building for First Mechanics National Bank, to Belmont Iron Works.

ALLENTOWN, PA., 200 tons, garage, to Lehigh Structural Steel Co.

PENNSYLVANIA RAILROAD, 500 tons, four bridges, to McClintic-Marshall Co.

HARRISBURG, PA., 3300 tons, office building, to McClintic-Marshall Co.

ATLANTA, GA., 2000 tons, new steam power plant for Georgia Power Co., to Ingalls Iron Works.

BROCKVILLE, ONT., 100 tons, Nurses' Home, to Dominion Bridge Co.

BUFFALO, 300 tons, Firestone Tire & Rubber Co., John W. Cowper Co., general contractor, to McClintic-Marshall Co.

LOCKPORT, N. Y., 100 tons, two schools, to Kellogg Structural Steel Co.

MUNCIE, IND., 600 tons, Automotive Specialty Co., to Indiana Bridge Co.

ESCANABA, MICH., 250 tons, State highway bridge in Delta County, to McClintic-Marshall Co.

CHICAGO, 6600 tons, two gas holders for Peoples Gas Light & Coke Co., to an unnamed bidder.

CHICAGO, 380 tons, office building for Inland Steel Co., to Vanderkloot Steel Works, local.

CHICAGO, 440 tons, Blackstone shop, to McClintic-Marshall Co.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 550 tons, girder spans, to American Bridge Co.

OMAHA, NEB., 500 tons, depot, to Milwaukee Bridge Co.

UNION PACIFIC, 200 tons, bridge, to American Bridge Co.

SASKATOON, SASK., 750 tons, building for Dominion Government, to Dominion Bridge Co.

TACOMA, WASH., 110 tons plates, penstock for Cushman project, to Seattle Boiler Works.

WALLA WALLA, WASH., 100 tons, prison building for women, to Hofius Steel & Equipment Co.

EUREKA, CAL., 300 tons, hospital, to Moore Dry Dock Co.

LONG BEACH, CAL., 125 tons, piers A and B, to unnamed interest.

LOS ANGELES, 500 tons, exhibit building at Pomona fair grounds, to McClintic-Marshall Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON, 3000 tons, office building, Franklin and Federal Streets.

BOSTON, 400 tons, Massachusetts School of Arts.

BOSTON, 392 tons, Boston Insurance Co. building.

BOSTON, 160 tons, Lamson & Hubbard Co. store on Boylston Street.

BOSTON & MAINE RAILROAD, 250 tons, roundhouse at Somerville, Mass.

HOLYOKE, MASS., 130 tons, Chemical Paper Co. plant.

MONTREAL, 1000 tons, office building at 618 St. James Street for James T. Stranger & Co.

NEW YORK, 6000 tons, apartment building on West Fifty-ninth Street.

NEW YORK, 2500 tons, building for County Trust Co. on Eighth Avenue.

TARRYTOWN, N. Y., 3000 tons, Chevrolet Motor Co. plant.

PENNSYLVANIA RAILROAD, 14,000 tons, two bridges over the Hackensack River at Marion, N. J.; bids open July 25.

STATE OF NEW JERSEY, 100 tons, five highway bridges at Somerville, N. J.; general contract to Richards & Gaston, Inc.

PHILADELPHIA, 3000 tons, office building and garage, 1616 Walnut Street.

PHILADELPHIA, 1000 tons, office building, Seventeenth and Sansom Streets.

PHILADELPHIA, 200 tons, Woman's Medical College and Hospital; bids open July 17.

BUFFALO, 8000 tons, new City Hall; John W. Cowper Co., low bidder on general contract.

SELFRIDGE FIELD, MICH., 700 tons, bids rejected and project postponed one year.

CHICAGO, 1000 tons, Parker junior high school.

CHICAGO, 600 tons, for Edison Electrical Appliance Co.

CHICAGO, 8000 tons, Cuneo Tower.

ROCK ISLAND, ILL., 800 tons, power house and addition to motor building for International Harvester Co.

ST. PAUL, MINN., 1300 tons, viaduct.

COLUMBIA, MO., 300 tons, trusses for roof over gymnasium, Missouri State University.

REGINA, SASK., 200 tons, parts and service building for General Motors Corporation of Canada.

SEATTLE, 1375 tons, West Garfield Street bridge; bids Aug. 2.

SEATTLE, 110 tons, hangar for Boeing Airplane Co.; bids being taken.

TACOMA, WASH., 150 tons, second unit Cushman Dam project; bids being taken.

Simplified Practice on Skid Platforms

Taking up the work on elimination of waste through simplified commercial practice, recommendation R95-28 of the United States Department of Commerce relates to skid platforms. In accordance with unanimous action of a general conference of representative manufacturers and users of skid platforms, the clearance dimensions recommended for adoption include minimum horizontal distance inside of runners, or other supports, of 29 in., and a clear height of 8 in. or 12 in., in the two standards, from the bottom of the runner or other support to the underside of the platform.

In discussing the proposed standards, it is pointed out that a hand-lift truck can be used to handle any standard skid of either of the two heights mentioned. Interchangeability of skids is essential if greatest benefit is to be derived from their use. This is a large factor in determining that a standard size be adopted.

A survey made by manufacturers showed that the lifting platforms of more than 90 per cent of the power-lift trucks were approximately 11 in. high and hence could run under the 12-in. skid. Of the hand-lift skids, 60 per cent had platforms approximately 7 in. high in the lowest position, and hence could be run under the 8-in. skid. More than 80 per cent of both types of lift trucks had lifting platforms more than 27 in. wide, and consequently are readily usable with the proposed 29-in. clearance width.

For the manufacture of full-finished automobile sheets, the Apollo Steel Co., has placed orders for a continuous sheet normalizer, three walking beam type continuous sheet pack furnaces, four walking beam type continuous pair furnaces and 11 box annealing furnaces. The equipment will be supplied by the Surface Combustion Co. The Central Alloy Steel Co., Canton, Ohio, has ordered an additional continuous sheet pack furnace, of the walking beam type, for the mills at Massillon.

Non-Ferrous Metal Markets

Copper Inactive but Firm, Tin Quiet, Lead Lower, Zinc Sales Light

NEW YORK, July 9.

Interruptions due to the holiday have slowed up all the markets and they are now just beginning to recover. All prices are steady.

Copper.—Foreign consumers are the principal buyers and have been moderately active for a week. Sales this morning were 1000 tons, which is large under present conditions. For the past week they have averaged about 1000 tons a day. If foreign consumers should absorb their average requirements, based upon consumption for recent months, they must still buy about 30,000 tons for July delivery. They have not bought much metal for August or September, and it is estimated that, if they should become at all active, their requirements would be quite heavy. Indications are that they overbought early this year. Domestic consumers still are buying only what they actually need. They have considerable metal to purchase for August and have bought very little for September. It is figured that they must soon come into the market for fairly liberal tonnages because it is known that their orders for finished material are better than for some time, particularly in wire. Primary producers continue out of the market, sales being confined almost entirely to custom smelters. In general, the market is gradually returning to the hand-to-mouth buying policy which ruled so long before the scramble for metal advanced the price to 24c. early this year. Another factor possibly holding up purchases is the announcement of statistics for June, which should be out this week. It is freely acknowledged that this will reveal a liberal increase in stocks, but that the curtailment of output will begin to show up. Prices are unchanged and steady, with electrolytic copper quoted at 18c., delivered in the Connecticut Valley, and at 18.30c. c.i.f. usual European ports. Lake copper is moderately active and unchanged at 18c. to 18.12½c., delivered. Some buying for early July delivery is reported for both Lake and electrolytic copper.

Tin.—Sales of Straits tin for the week ended Saturday, July 6, were light, at 700 to 800 tons, mostly to consumers. The delivery involved has been principally nearby metal and the feature has been the steadi-

ness of prices, which have held close to 45c. Spot metal continues to sell at a discount, or about 1c. per lb. below December-January. Not much has been heard in the last week about activities of "the group" in London. They are still buying some metal to support the market and were more active today. Spot Straits tin is quoted today in a dull market at 45.12½c., New York. London prices today were about £3 per ton higher than week ago, with spot standard quoted at £204 10s., future standard at £207 15s. and spot Straits at £208. The Singapore price today was £210 5s.

Lead.—A change in its contract price from 7c. to 6.90c., New York, was made on Friday, July 5, by the American Smelting & Refining Co. Following this, the leading producer in the West lowered its quotation from 6.80c. to 6.75c., St. Louis, and later to 6.70c., which is now the market. Demand, particularly for spot and early delivery, is reported very good.

Zinc.—The price situation in prime Western zinc continues somewhat mixed. Demand is very light and is easily being absorbed by one or two companies, which are taking orders at 6.70c., East St. Louis. Another company is quoting 6.75c., and doing some business. Those producers which for some time have maintained their quotation of 6.80c., East St. Louis, still adhere to this policy and have been doing their share of the business. In fact, in one week during June, statistics of the American Zinc Institute show that, out of 2800 tons sold that week, 2200 tons went at 6.80c. It is felt that galvanizers in particular and some other consumers must soon come into the market, and it would not be surprising if a little later the quotation should reach 6.80c. as the minimum. One company placed a large order for delivery this month during the last week and may place a similar order before the month closes.

Antimony.—Because holders of Chinese metal prefer to make sacrifices rather than put the metal in warehouses, the market is somewhat depressed and the metal is selling at 8.50c. for spot and 8.62½c. for future, duty paid, New York.

Nickel. — Wholesale lots of ingot nickel are quoted at 35c. per lb., with shot nickel at 36c. and cathodes of electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is obtainable at the published price of 23.90c. per lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 9.—This market was quiet during the early part of the week, but in recent days has turned more lively. Prices for tin are higher, while quotations on lead are lower. The old metal market is quiet.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 45.75c.; lead, 6.85c.; zinc, 6.80c.; in less-than-carload lots: antimony, 9.75c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

Western Refrigerator Line Building 500 Cars

ABSENCE of railroad equipment buying on a large scale was noted during the past week. The dearth of inquiries indicates that the dullness which pervades the market will continue in the near future. The Western Refrigerator Line Co., recently organized, is building 500 refrigerator cars. The Manila Railroad has ordered 100 flat cars and 100 box cars, while the Canadian Pacific has bought 100 steel cars from a Canadian car manufacturer. The Reading is inquiring for 200 all-steel gondola cars. The Great Northern is expected to purchase 12 locomotives of the 4-8-4 type. Details of the week's business follow:

Canadian Pacific has ordered 100 steel cars from Canadian Car & Foundry Co.

Great Northern is inquiring for 12 locomotives of 4-8-4 type.

Chicago, North Shore & Milwaukee has ordered 25 interurban parlor motor cars from Standard Steel Car Co.

John A. Roebling's Sons Co., Trenton, N. J., has ordered 12 gondola cars from American Car & Foundry Co.

United Fruit Co. is inquiring for 50 banana cars.

Norfolk & Western will build 10 all-steel box express cars in its own shops.

Reading is inquiring for 200 all-steel gondola cars.

New York, New Haven & Hartford is inquiring for 50 70-ton brick cars.

Manila Railroad has ordered 100 flat cars and 100 box cars of 30-ton capacity from Gregg Co.

Savannah & Atlanta is inquiring for three switching locomotives.

American Locomotive Co. has received orders for one locomotive from Delaware & Hudson and one from Standard Oil Co. of Indiana. Baldwin Locomotive Works will furnish one locomotive to Illinois Northern.

Western Refrigerator Line Co., recently organized, is building for its own account 500 refrigerator cars in shops of American Car & Foundry Co.

Cudahy Packing Co. is in market for 50 refrigerator car underframes.

Chicago, Milwaukee, St. Paul & Pacific will buy 15 caboose car underframes.

The Weirton Steel Co., Weirton, W. Va., has acquired the Isabella mine of the Hecla Coal & Coke Co., near Brownsville, Pa. The purchase included 1200 acres of coal lying along the Monongahela River, which is fully developed and equipped with modern facilities for the preparation and shipment of coal by both rail and river.

Reinforcing Steel

Inquiries Are Heaviest Since Early in May

ALTHOUGH awards showed a decrease in the past week, inquiries were the heaviest since early in May. The largest letting was 1000 tons for a power plant at Michigan City, Ind., and a building at Seattle, Wash., will take 900 tons. The total business for the week was about 4700 tons. Pending jobs amounting to 4300 tons include 1225 tons for a highway bridge at Seattle, 1000 tons for a store at Dubuque, Iowa, and 500 tons for a grain elevator for the Burlington railroad at St. Louis. Awards follow:

BOSTON, 200 tons, automobile service station, to Concrete Steel Co.

NEW YORK, 200 tons, subway work, to McClintic-Marshall Co.

NEW YORK, 200 tons, route 1, section 19, of subway, to McClintic-Marshall Co.

HEMPSTEAD, N. Y., 100 tons, school, to Truscon Steel Co.

MICHIGAN CITY, IND., 1000 tons, power plant, to an unnamed bidder.

PEORIA, ILL., 300 tons, bridge, to Kalman Steel Co.

CHICAGO, 150 tons, Norwegian-American Hospital, to Concrete Engineering Co.

CHICAGO, 350 tons, Victor X-Ray Co., to Joseph T. Ryerson & Son.

ST. LOUIS, 265 tons, addition to Barnes Hospital group, to Laclede Steel Co.

SACRAMENTO, CAL., 150 tons, hotel, to W. S. Wetenhall Co.

SALINAS, CAL., 202 tons, sewer project, to unnamed bidder.

SAN FRANCISCO, 100 tons, fire wall, Sixteenth and Wisconsin Streets, to W. S. Wetenhall Co.

SPOKANE, WASH., 500 tons, Montgomery Ward building, to Pacific Coast Steel Co.

SEATTLE, 900 tons, City-County Building addition, to Northwest Steel Rolling Mills.

SEATTLE, 200 tons, Aeronautics Hall, University of Washington, to Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

JERSEY CITY, N. J., 135 tons, garage, general contract to Industrial Engineering Co.

BUFFALO, 300 tons, additional section, Hertel Avenue sewer.

JAMESTOWN, N. Y., 185 tons, telephone exchange building.

CLEVELAND, 250 tons, factory addition for Richman Brothers.

CINCINNATI, 200 tons of bars for sewer construction.

DUBUQUE, IOWA, 1000 tons, store; C. W. Nichol, architect.

BENTON HARBOR, MICH., tonnage not stated, theater and store; C. W. Nichol, architect.

CHICAGO, 200 tons, office building; McLellon Construction Co., contractor.

CHICAGO, 300 tons, for Victor X-Ray Co.; previously reported as 100 tons.

ST. LOUIS, 500 tons, grain elevator for Burlington Railroad.

SEATTLE, 1225 tons, West Garfield Street bridge; bids Aug. 2.

AMERICAN LAKE, WASH., 125 tons, hospital; bids being taken.

PERSONAL

HERBERT F. PERKINS, Chicago, the new president of the International Harvester Co., has long been a conspicuous figure in the Harvester organization. His ability and experience well equip him for the responsibilities which ALEXANDER LEGGE was

H. F. PERKINS

obliged to give up when President Hoover summoned him to the chairmanship of the Federal Farm Board. Mr. Perkins has had over 30 years of continuous service in the farm implement industry—three years with the McCormick Harvesting Machine Co. which he joined in 1898 to develop its purchasing department, and then more than 27 years among the executives of the Harvester company. Soon after the formation of the latter in 1902 he organized the purchasing department of the combined companies, and in 1906 was made operating manager of the steel and lumber properties. Later, when these properties were organized as the Wisconsin Steel Co. and the Wisconsin Lumber Co., he became president of both. Subsequently he was elected vice-president of the Harvester company in charge of manufacturing in the United States and abroad. In 1922 he was elected first vice-president, with general executive duties, aiding the president and substituting for him in his absence. During the war, Mr. Perkins spent a number of months in Washington as business adviser to the chairman of the War Labor Policies Board. He also served as representative of the Chamber of Commerce of the United States in President Wilson's first industrial conference. He is a vice-chairman of the National Industrial Conference board, and has been a director of various Chicago banks. He is in his sixty-fifth year.

H. R. SMALLMAN, for the past three years assistant to the sales manager of Hanson-Van Winkle-Munning Co., has been made manager of the Chicago office, with headquarters at 549 West Washington Boulevard. H. M. CHERRY, who has represented the company in Michigan for the past seven years, has been appointed manager of the Detroit office, 5415 Twelfth Street, and LOUIS M. HAGUE has become manager of the Pittsburgh and Cleveland office, with headquarters at 106 Liberty Avenue, Pittsburgh.

—

THOMAS W. STONE has been elected a vice-president of the Western Gas Construction Co., Fort Wayne, Ind.

—

J. P. ARMSTRONG has been appointed by Geuder, Paeschke & Frey Co., Milwaukee, to take over the management of the metal stampings contract division of the company for California, with headquarters in the Balboa Building, San Francisco.

—

CHRISTIAN WILSON, JR., formerly general manager of the Montreal plant of the Bryden Neverslip Co., has been elected general superintendent of the Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa., succeeding F. D. ANDREWS, who resigned. After graduation from Lehigh University with the degree of mechanical engineer, Mr. Wilson became associated with the Bethlehem Steel Co. and later with the Pennsylvania Power & Light Co.

—

WILLIAM L. DITGES has been elected vice-president in charge of engineering of the Mackintosh-Hemphill Co., Pittsburgh. He has been with the company since 1916, serving successively as chief draftsman, assistant chief engineer and chief engineer. He received his education at Cologne, Germany, and prior to going with Mackintosh-Hemphill Co. was connected with the Carnegie Steel Co. at New Castle, Pa., the Nichols Copper Co., New York, and the Bethlehem Steel Co. W. R. DUDA succeeds Mr. Ditges as chief engineer. He has been with this company for 11 years, for the past several years in the capacity of assistant chief engineer. His previous connections included five years with the United Engineering & Foundry Co. and four years with the American Sheet & Tin Plate Co.

—

S. M. ALBERTSON has been appointed contact engineer for the Bantam Ball Bearing Co., South Bend, Ind. He was formerly connected with the Central Specialty Co., Detroit.

—

THOMAS EVANS, vice-president, Merchant & Evans Co., Philadelphia, CHARLES R. HOOK, vice-president, American Rolling Mill Co., Middletown, Ohio, and CHARLES PIEZ, chairman, Link-Belt Co., Chicago, are members of a committee appointed to study immigration questions for the Chamber of Commerce of the United States.

—

F. O. SCHRAMM, who has been appointed general manager of sales of the Pressed Steel Car Co., New York, as briefly mentioned in last week's

F. O. SCHRAMM

issue of THE IRON AGE, has been with the company for 22 years, having started at the age of 16 as a stenographer in the operating department of the Pressed Steel Car Co.'s subsidiary, the Western Steel Car & Foundry Co. He worked in various capacities in the operating and sales departments at the Hegewisch plant and in the Chicago office until Jan. 1, 1917, when he was transferred to the New York office. He became assistant secretary in 1921 and assistant general sales manager on Feb. 1, 1928. His appointment as general manager of sales took effect July 1. C. E. POSTLEWAITE, who has been made assistant vice-president of the Pressed Steel Car Co., entered the service of the company in 1897. Previous to that time he was engaged in railroad work, from 1883 to 1890 as rodman, telegraph operator and car clerk for the Pennsylvania Railroad and from 1890 to 1897 in various capacities ranging from chief clerk to general superintendent of the Norfolk & Western. Mr. Postlewaite went with the Schoen Pressed Steel Car Co. in 1897, continuing with the Pressed Steel Car Co. when the Schoen company was merged with Pressed Steel. He was appointed general sales manager of the company in 1915, and served in that capacity until July 1, when he was appointed assistant vice-president.

—

THEODORE KIPP, vice-president and managing director of Kipp-Keppy Ltd., Winnipeg, Canada, and presi-

dent of the Winnipeg Service Co., has been reelected chairman of the new industries committee of the Industrial and Development Board of Manitoba. He recently returned from Europe and says that European manufacturers look with favor on establishing branch factories in Canada. He is also vice-president of the Canadian Engineering & Construction Co., vice-president of Sullivan-Kipp-Chase, director of William Hamilton, Ltd., and vice-president of the Canadian Novadel, Ltd.

—

L. H. BEYER, for many years connected with the American Radiator Co. in Buffalo and New York as manufacturing department executive and as director of purchases, has become

L. H. BEYER

sales director of the Durbar bearing bronze division of the Buffalo Bronze Die Cast Corporation, Buffalo.

—

HENRY JACOBSON, who has been identified with the baling press industry for many years, has been appointed chief engineer of the Galland-Henning Mfg. Co., Milwaukee.

—

T. W. BATTLE has been appointed district manager of the Combustion Engineering Corporation, for the Charlotte, N. C., territory, with office at 919 Johnston Building. I. S. FORDE has been made acting district manager of the Atlanta district to succeed T. J. CLEARY, resigned, with offices in the Candler Building, Atlanta. E. WALTHALL has been appointed district manager of the New Orleans territory, with office in the Union Indemnity Building.

—

W. M. CUSAC has been appointed a member of the Chicago sales force of the American Hoist & Derrick Co., St. Paul, Minn. He was formerly connected with the McMyler-Interstate Co., Cleveland.

—

FRANK W. FRY has become associated with Hausman & Wimmer Co., scrap dealer, New York.

H. J. FREYN, president Freyn Engineering Co., Chicago, sailed for Europe on the Aquitania July 7, on a business trip lasting until the end of the summer, including Russia, where his company is engaged in iron and steel engineering work.

—

A. E. ADAMSON, heretofore of the Acme Steel Co., is now connected with the sales department of the Brainard Steel Corporation, Warren, Ohio. Mr. Adamson is a brother of W. J. Adamson, vice-president of the company. He was at one time connected with the American Tube & Stamping Co., Bridgeport, Conn., and prior to that was in the operating department of the Trumbull Steel Co.

—

C. B. KARLSON, vice-president, Seamless Steel Equipment Corporation, 39 Broadway, New York, sailed July 6 for a six weeks' business trip to France, Germany and England.

—

BURNHAM FINNEY, who for the past five years has been editorial representative of THE IRON AGE at Cincinnati, has been made a member of the New York staff, with broader activities. He has been succeeded at Cincinnati by ROBERT G. MCINTOSH, who formerly was associated with the Cincinnati *Enquirer* and for the past few years has represented several business papers.

—

GEORGE F. BAIN has been made manager of the northeastern district, which includes New England and New York north of Westchester and Rockland counties, for the Copperweld Steel Co., Glassport, Pa. PAUL VAN WAGNER continues as district manager for New York, New Jersey, Pennsylvania and West Virginia. The headquarters for both will be at 30 Church Street, New York.

—

H. L. RITTS, for the past 10 years sales manager of Holcroft & Co., Detroit, has become general sales manager of the William H. Nicholls Co., Inc., Richmond Hill, N. Y., and will be in charge of sales and engineering offices at 207 Curtis Building, Detroit. S. H. SUTTON, formerly of the Chicago Gas Light & Coke Co., has been appointed Chicago district manager. The company has expanded its line of molding machines to include a complete molding machine conveyor and sand-conditioning equipment.

—

J. W. MORGAN has been appointed assistant secretary and treasurer of the Brainard Steel Corporation, Warren, Ohio.

—

F. H. WILLCOX, vice-president Freyn Engineering Co., Chicago, returned July 2 on the Homeric from a six weeks' business trip in England in connection with consulting work for the Ford Motor Co.

Obituary

RALPH W. CLARK, one of the best known pig iron men in the East, died at State Hospital, Scranton, Pa., July 4, from complications following typhoid fever. His death came unexpectedly after he had passed the crisis of the fever itself. Mr. Clark had spent about 27 years in the pig iron business. He had only recently passed his 45th birthday. For about 20 years he was with the old firm of Rogers, Brown & Co., now Rogers, Brown-Crocker Brothers, Inc. He was for a time in the Buffalo office of that firm, and came to the New York office in 1906, continuing as salesman in the New York district

R. W. CLARK

until 1922, when he was appointed district sales agent in New York for Pilling & Co., of Philadelphia. A year later he was elected a vice-president of Pilling & Co. This position he resigned in September, 1928, to become connected with the Hudson Coal Co., Scranton, Pa., which is owned by the Delaware & Hudson Railroad Co. Effective Jan. 1, Mr. Clark became vice-president and general sales agent of the Chateaugay Ore & Iron Co. and the Chazy Marble Lime Co., both subsidiaries of the Hudson Coal Co., and at that time he took charge of the sale of Chateaugay pig iron, which had been handled for years by Pilling & Co.

—

WILLIAM M. TOBIAS, until Sept. 1, 1925, general purchasing agent for the Bethlehem Steel Corporation, died at Lake Placid, N. Y., July 6, aged 64 years. He had been connected with the company for about 25 years, with the exception of about two years when he became associated with Milliken Brothers Mfg. Co., fabricator of steel transmission towers, returning to the Bethlehem company in 1909. Mr. Tobias started with the Bethlehem Iron Co. as purchasing agent, having had previous experience with the Long Island Railroad.

Construction Work Declined During June

Construction contracts awarded in the territory east of the Rocky Mountains during June amounted to $545,891,100, states the F. W. Dodge Corporation. This represents a decline of 7 per cent compared with the preceding month, but is modified by the fact that the normal seasonal decrease is 6 per cent. The total for June shows a falling off of 16 per cent compared with the corresponding month of 1928.

Despite the general decline, several districts reported encouraging developments. In the Middle Atlantic States new building and engineering work in June totaled 7 per cent more than in May, and in the Southeastern States the volume was 24 per cent greater than in May and 36 per cent greater than in June, 1928. In the Northwest (Minnesota, the Dakotas and northern Michigan) construction contracts, although showing a decline from May, were 44 per cent more in June than in the same month last year and work begun in the first six months of 1929 was 38 per cent greater in volume than in the first half of 1928.

International Statistical Bureau Suggested

Desirability of creating an agency to gather and disseminate international industrial statistics was emphasized by Magnus W. Alexander, president National Industrial Conference Board, New York, in an address delivered before the International Chamber of Commerce on July 9, at Amsterdam, The Netherlands.

Mr. Alexander pointed out the need in each country, unless the situation is already adequately met, of a national private organization to assemble and interpret economic statistics of various industries and to coordinate them into a comprehensive "intelligence service" for the nation as a whole, cooperating at all times with the statistical services of the Government and of other bodies and thus benefiting from them. "Such national agencies, similar in organization and using similar procedure, methods and nomenclature, would be in a position to supply promptly the comparable and authentic information needed for the development of current, comprehensive, international industrial statistics."

In each country associated in such an effort, stated Mr. Alexander, "a patient and persistent educational process will be needed to teach business not only the value of comprehensive trade statistics, but also that they will be of no value if they are treated in a spirit of secrecy and individual unrest as a weapon against others, rather than as a tool with which all may work together. If the development of statistics of industry in the United States may be briefly characterized, it may be said that they have ceased to be a by-product of business, and have become one of its potent instruments."

Governmental agencies cannot secure sufficiently comprehensive information to supply the requirements for business guidance without the prior development of such information through private cooperative effort, or without a system of machinery so costly and elaborate as to be out of proportion to the value of the results, stated Mr. Alexander. However, it would seem that one of the valuable services that government can render is to record and disseminate information gathered through private cooperative effort. The greatest service government can give is to stimulate such effort and to aid it in various ways.

Smaller Stocks of Industrial Coal on Hand

Industrial stocks of bituminous coal as of June 1 are estimated by the National Association of Purchasing Agents as being equivalent to 25 days' supply at current rates of consumption. This compares with 27 days' on May 1. By industries, the stocks include: 17 days' supply for by-product coke plants; 51 days' for electric utilities and coal gas plants; 21 days' for railroads; 25 days' for steel mills and 27 days' for other industries.

Estimated industrial consumption in May was 37,298,000 net tons, which is a reduction of something more than 1 per cent from April consumption and, with the exception of January, the smallest total since November. Industrial stocks are figured at 31,282,000 tons on June 1, compared with 33,468,000 tons a month earlier. The latest figure is much the smallest in more than a year. It compares with 40,890,000 tons on June 1, 1928.

Factory Wages Remain High

Average weekly earnings in representative New York State factories were $30.03 in May, according to a report of the State Industrial Commissioner. While this is below the $30.07 of April and the $30.35 of March, it is otherwise, with the exception of last December, the highest monthly average ever reached. It compares with $29.19 in May, 1928, and practically the same amount the year before.

Ingot Brass June Prices

CHICAGO, June 29.—The Non-Ferrous Ingot Metal Institute reports the average prices per pound received by its membership on commercial grades of the six principal mixtures of ingot brass during the 28-day period ended June 21. As there are, as yet, no generally accepted specifications for ingot brass, it must be understood that each item, listed below, is a compilation representing numerous sales of metal known to the trade by the designation shown, but each item in reality including many variations in formulas. Until the program of standardizing the principal specifications, now progressing in cooperation with the American Society for Testing Materials, is completed, the following specifications will be understood to refer to "commercial grades":

Commercial 80-10-10 (1 per cent impurities)	17.309c.
Commercial 78 per cent metal	15.45c.
Commercial 81 per cent metal	15.616c.
Commercial 83 per cent metal	16.024c.
Commercial 85-5-5-5	16.331c.
Commercial No. 1 yellow brass ingot	13.515c.

Sheet and Tin Mill Wages Up for July-August

For July-August, tonnage rates paid to sheet and tin mill workers in mid-Western mills operating under the sliding scale wage agreement of the Amalgamated Association of Iron, Steel & Tin Workers, advance to 27 per cent above base, from 25½ per cent, paid in May-June. The increase follows an increase in the average selling price of Nos. 26, 27 and 28 gage black sheets shipped during the 60 days ended June 30, to 3.05c. a lb., from 3c., the average disclosed two months before. The examination of sales sheets and the settlement were conducted last week at Youngstown, at the office of Elias Jenkins, secretary of the Western Sheet and Tinplate Manufacturers Association.

Production and Shipment of Raw Materials and Finished Products in June

	June, 1929	May, 1929	June, 1928
Railroad locomotives shipped (a), number	78	99	51
Total, 6 months (a)	319	...	314
Exports in 6 months (a)	39	...	23 (b)
Unfilled orders, end of month (a)	552	444	201
Bituminous coal mined (c), net tons	37,900,000	40,172,000	35,963,000
Anthracite mined (c), net tons	5,015,000	6,308,000	5,301,000
Beehive coke (c), net tons	600,200	597,400	301,600

(a) Department of Commerce.
(b) Includes two electric units.
(c) United States Bureau of Mines.

Output Higher in Britain and Germany

British Pig Iron Production Increased—German Steel Tonnage Highest Since War—Japan Has Increasing Demand

(*By Cable*)

LONDON, ENGLAND, July 8.

CLEVELAND pig iron prices are strong as a result of the shortage of supplies and makers are not accepting last quarter business. Merchant sellers of pig iron are obtaining 1s. (24c.) a ton more than the minimum prices for any available small lots.

Output is expected to be increased by blowing in four more furnaces before the end of August, as local ore and coke production is being increased.

Belgium and Italy have bought further tonnages of hematite iron and domestic consumers are also active.

New business in finished steel is moderate, but specifications against current contracts are coming in more freely and consumers are pressing for larger supplies, especially of ship material, before the Scottish plants begin their holidays on July 11. The South Durham Steel & Iron Co., Ltd., is resuming operation of its Stockton-on-Tees plate mill, after more than 12 months of idleness.

Continental iron and steel business here is quiet, consumers displaying only a meager interest, especially in semi-finished material. Continental mills now need orders and quotations are inclined to recede, except on plates and shapes.

Tin plate inquiry is well maintained, but business is inactive, as consumers are uncertain of the trend of prices. Mills needing orders have accepted less than 18s. 3d. ($4.42) per base box, f.o.b. works port, to fill gaps in their schedules, but others prefer to suspend operations and draw the under-production payments from the association. Output probably will be further reduced under the restriction plan, so that the market should respond quickly to any heavy buying movement.

Galvanized sheets are quiet and mills are in need of orders. Japan has bought a few small lots of heavy and light-gage black sheets.

Clyde shipbuilding output in June was 31 vessels of 49,000 tons.

Steel Cartel Agreement May Be Renewed

Prospects Improve for Continuing European Association, Although Participation Quotas May Be Changed

BERLIN, GERMANY, June 24.—The prospect for a renewal of the International Steel Cartel after October has improved. At the Paris meeting last week it was agreed in principle that renewal was desirable, but no formal agreement as to the conditions is likely to be reached before the September meeting, to be held in Vienna.

The German group's proposals, as was foreseen, contained a demand that participation quotas shall be re-fixed upon the basis of actual production during the past few years. The exact amount of the quotas would depend upon what period is chosen as the basis for the production figures. Germany's expectation is that its quota of 43.25 per cent will be raised by another five points. The West European groups are understood to oppose the German demand.

Germany's other demand is that the restriction of its export to 330,000 tons a month shall be abolished, or that there shall be export restriction for all countries. This demand has not been considered.

Against the renewal of the International Cartel still stands the obstacle that no progress has been made toward renewing the native German syndicates. At Paris the cartel decided to increase the total production program by 1,000,000 tons to 32,295,770 tons a year. This holds good for the third quarter of 1929 and thereafter unless altered. The effect is to increase Germany's penalty-free quota by approximately 430,000 tons a year.

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

British Prices, f.o.b. United Kingdom Ports

*Open-hearth steel, 10s. ($2.42) per ton extra.

Germany's objection to the 330,000-ton a month limitation of exports has of late increased, owing to the fact that the proportion of its foreign to home orders is steadily rising.

The International Wire Rods Cartel has not yet been renewed. At the last meeting in Berlin in April renewal was agreed upon in principle, but Germany made certain reservations, including a right to withdraw if the native Ingot Steel Syndicate and the other native syndicates are not renewed. A revision of quotas all around is demanded. Germany's competitors complain that it has of late much exceeded its quota, and Germany in turn complains that its quota is based on production in 1926, a very bad year for the whole iron and steel industry. The revival of the International Wire Cartel, which was at one time considered a condition precedent to the renewal of the Wire Rods Cartel, has not been negotiated.

Czechoslovakian Wire Mills Seek Larger Export Trade

HAMBURG, GERMANY, June 21.—Competition in wire and wire products for export is expected to increase considerably as a result of efforts by the Czechoslovakian wire mills to secure a larger share of the trade. At a recent meeting in Prague, the mills pointed out that the Czechoslovakian domestic market would be unable to absorb the same tonnage of wire and wire products as last year and that the surplus must be sold for export. The mills are well equipped with modern machinery and wages are 45 to 50 per cent of the German scale. Continental agents for Czechoslovakian mills are offering galvanized wire, plain and barbed, and wire nails at low prices, which are expected to bring about a further reduction in the export quotations by other wire producing countries.

Krupp Grants Rebates on Nirosta Steel

HAMBURG, GERMANY, June 24.—The Krupp Co. has granted a considerable rebate to the German cutlery industry on purchases of Krupp Nirosta steel when used to manufacture cutlery for export. This will enable the German cutlery industry to reduce its export prices.

Belgian Production in May

BERLIN, GERMANY, June 26.—Belgium's production in May was: Pig iron, 348,400 tons as against 336,110 tons in April; steel ingots, 330,600 tons against 332,020 tons; rolling-mill products, 298,800 tons against 300,340 tons.

Orders are in satisfactory volume and prices are firm without, however, any marked rising tendency. English competition in pig iron has weakened.

German Steel Output Highest Since War

Confidence Returning Following Reparations Agreement—Export Trade Reported Very Favorable

BERLIN, GERMANY, June 24.—The increase in steel production, which began in March, continues. The May output was the highest for any month since the war. The increase was almost entirely in structural shapes and railroad permanent way materials, sales of which in May were between 50 and 200 per cent higher than in February. According to the Ingot Steel Syndicate's returns, the output of all steel is now around 5 per cent higher than the combined quotas of member firms, whereas in February it was 7 per cent below. Orders on the books are still increasing. Production figures are:

	1929	1928
Ingots:	Metric Tons	
May	1,421,047	1,250,256
January-May	6,892,882	6,627,696
Rolled Products:		
May	959,090	897,204
January-May	4,697,514	4,717,503

The general business situation has improved. The reserve shown by manufacturers during the period of uncertainty as to the outcome of the Paris reparations conference has given way to a feeling of confidence. This feeling is strengthened by the fact that in May, for the first time since 1926, the foreign trade balance was favorable.

Much of Germany's recent export steel business has come from England. French and Belgian producers were unable to sell, owing to their large home consumption, and England became increasingly dependent on Germany.

Of the steel market as a whole, authorities speak optimistically. The fact that the monthly average of ingot output so far this year has exceeded that of the boom year 1927 is considered proof that the steel-consuming industries are doing well. Further, the foreign demand for German machinery and for other steel and iron wares continues to increase, and at the same time the practical cessation of borrowing from abroad tends to check imports.

Change in German Steel Shipments to America

HAMBURG, GERMANY, June 24.—The German steel industry, which this year was leading in the export shipment of finished steel products to the United States, reports a change in the forms of steel shipped there. Formerly the shipments were principally structural shapes, plates and other construction material, whereas now the shipments are mostly tubing, cold-rolled strips and bars for the production of bolts, nuts and rivets.

Polish Competition May Be Factor in Steel Exports

HAMBURG, GERMANY, June 24.—In German steel trade circles the establishment of the Consolidated Silesian Steel Corporation is regarded with much interest. Through the organization of this company, the amalgamation of Upper Silesian steel works has been accomplished, and it is supposed in German steel circles that one of the first steps of this company will be to foster export business.

Poland offers special opportunities for a strong financial group to build up a remunerative export trade. Wages and transportation costs are low and the Government is facilitating the building up of export trade. Moreover, shipping facilities from Danzig have been greatly improved in recent years.

Lack of funds for modernization and export organizing has so far made it impossible for Poland to build up a large export business. An extension of sales in Poland is hardly possible, because the domestic Poland market will for some time be small. Therefore the expansion program will certainly be started with a view to selling steel abroad. It must be remembered that the Polish industry, which is now virtually under the control of the Harriman group of New York, is not a member of any cartel except the tube cartel, and, as an outsider, is in a unique position to improve its situation very much. There is little doubt in Continental export circles that the Polish competition will soon be strongly felt.

Japan's Sheet Requirements About 225,000 Tons

YOKOHAMA, JAPAN, June 15.—It will be necessary to import about 78,600 tons of light-gage black sheets, 13 to the bundle, during the present year according to certain large Japanese sheet consumers. This estimate is based on a yearly demand in Japan for 160,000 metric tons of galvanized sheets of light gage, 30,000 tons of sheets used in the manufacture of enameled and other kitchen ware and exports of about 35,000 tons of galvanized sheets, a total of about 225,000 tons. Japanese domestic output of light-gage sheets, which has increased in recent months, is about 146,400 metric tons, of which 110,000 tons is produced by the Kawasaki Dockyard Co., Kobe, 10,000 tons by the Nakayama Sheet Mfg. Co., 24,000 metric tons by the Government Steel Works and 2400 tons by the Nippon Kogyo Kaisha.

German Thin-Sheet Makers Combine

New Domestic Sales Agreement Believed to Provide Basis for Establishment of Thin-Sheet Syndicate

HAMBURG, GERMANY, June 15.—The Feinblechkontor G.m.b.H., with headquarters in Cologne, which has been formed by light gage sheet producers, includes in its membership the Vereinigte Stahlwerke A. G., Düsseldorf, and Otto Wolff & Co., Cologne. Hereafter it will be the exclusive sales agency in the German domestic market for thin sheets.

The sheet mills controlled by these two companies are the August Thyssen Hütte, Niederrheinische Hütte, Hoerder Verein, Huestener Gewerkschaft, Westfälische Union in Nachrodt, Meggener Walzwerke, Eichener Walzwerk, Walzwerk Weidenau, Sieghutter Eisenwerk, Schleifenbaum & Mattner in Siegen, Von der Zypen-Wissen, Bonzel & Co. in Olpe, Heggener Walzwerk in Heggen, Stahlschmidtsche Werke in Kreuzthal, Bruchs Wwe. in Weidenau, Rasselsteiner Eisenwerk Gesselschaft in Neuwied-Rasselstein. These mills produce about 50 per cent of all light gage steel sheets in Germany.

The new association is considered to have established a good basis for the formation of a thin sheet syndicate. The important outsiders producing light gage sheets include the Ohler Eisenwerke at Ohle, Storch & Schoenberg A. G., Geisweid, which is controlled by the Mannesmann interests, Bergbau und Hütten A. G., Friedrichshütte, controlled by Friedrich Thyssen & Co., Geisweider Eisenwerke A. G., controlled by the Thyssen and Kloeckner interests, Eisenwerk Gesselschaft Maximilianshütte in Rosenberg, Eisenhüttenwerk Thale at Thale, Capito & Klein A. G., at Benrath, controlled by the Krupp interests, Stahl und Walzer Hennigsdorf A. G., controlled by the Mitteldeutsche Stahlwerke A. G. and the Allgemeine Electricitäts Gesellschaft and the Eisen und Hüttenwerke A. G. in Bochum.

Japan Increasing Indian Pig Iron Imports

YOKOHAMA, JAPAN, June 15.—It is estimated that about 500,000 tons of Indian pig iron will be imported by Japanese consumers this year. In March, arrivals totaled 40,568 tons from Calcutta, bringing the imports for the first three months of this year to 118,035 tons, or 42,233 tons more than in the first quarter of 1928. At this rate, the total of imports should be close to 500,000 tons, about 150,000 tons more than last year. Domestic pig iron producers are seeking an adequate method of preventing such heavy importation of iron, and may find it necessary to reduce their quotations drastically to meet this competition.

Canadian Iron and Steel Output Up in May

TORONTO, ONT., July 5.—May coke pig iron output in Canada was 81,464 gross tons, an increase of 3 per cent over the 79,341 tons produced in April of this year, but 7 per cent under the total of 87,811 tons reported for May a year ago. The number of blast furnaces blowing on May 31 remained at six, the same number as on April 30. Active furnaces had a daily capacity of 2475 tons per day, or 60 per cent of the total capacity of all blast furnaces in Canada.

Since the first of June the Canadian Furnace Co., Port Colborne, Ont., blew in its Victoria furnace, with a capacity of 500 tons per day.

For the five months ended with May pig iron production amounted to 428,684 tons, as compared with 370,634 tons for the corresponding period of 1928, and 334,276 tons produced during the first five months of 1927.

Production of ferroalloys during May at 6351 tons was 11 per cent over the 5744 tons reported for April. Total production for the five months ended with May was 30,332 tons, as compared with 21,857 tons during the same five months of last year.

Output of steel ingots and direct steel castings during May amounted to 126,372 tons, as compared with 122,102 tons of April and 117,655 tons in May, 1928. As compared with figures for April, production for the month under review shows a gain in steel ingots to 120,015 tons, compared with 115,882 tons in the previous month, and an increase in steel castings to 6367 tons, compared with 6220 tons of April.

For the five months of this year the production of steel ingots and castings amounted to 619,337 tons, an increase of 17 per cent over the 631,808 tons of the corresponding period last year, and 45 per cent greater than the 427,370 tons produced in the first five months of 1927. This year's output includes 590,259 tons of steel ingots and 29,078 tons of direct steel castings.

Kawasaki Company's Large Sheet Bar Capacity

According to A. Cameron & Co., Kobe, Japan, the market for black sheets is depressed with prices continuing downward. By the end of June the Kawasaki Dockyard Co. at Kobe, the largest black sheet mill in Japan, is expected to be producing, with its new mills, 200,000 tons of sheet bars and 150,000 tons of black sheets a year. Imports of black sheets in April totaled 6143 metric tons, of which 3710 tons came from the United Kingdom, 1510 tons from Germany, 830 tons from the United States and 93 tons from other countries.

Congress of Metallurgists in Germany

The forthcoming congress of metallurgists to be held in Düsseldorf, Germany, Sept. 9 to 12, promises to be extraordinarily interesting. The congress will comprise the presentation and discussion of about 15 scientific and practical papers relating to metallurgical work; visits to works in or near Düsseldorf and Berlin, and receptions and other social functions.

G. Shaw Scott, 36 Victoria Street, London, S.W.1., is secretary of the Institute of Metals, under which the congress is to be held.

German Foreign Trade in Iron and Steel

(In Metric Tons)

Item	Exports April	Exports May	Imports April	Imports May
Pig iron and ferroalloys	35,904	44,275	12,729	11,495
Ingots, blooms and billets	68,157	52,795	7,653	8,045

Machinery Markets and News of the Works

Tool Demand Declines

Holiday and Usual Seasonal Letup in Buying Are Responsible for Lessened Bookings

DEMAND for machine tools tapered off somewhat the past week on account of the Fourth of July holiday, together with the usual seasonal decline. The New York district, however, proved an exception, with the volume of sales holding up remarkably well.

Business continues to come from widely diversified classes of users for one or more machines each. For example, orders in the past week were placed by manufacturers of such varied lines as printing machinery, electric lamps, reduction gears, motor trucks, airplanes, conveying equipment, automobile trunks, steel, radios and ball bearings.

In some lines of tools, deliveries have improved, but many builders report the situation unchanged, with deliveries long deferred.

The Amtorg Trading Corporation, New York, is now inquiring for equipment for a large tractor plant to be built in Russia. Purchases are expected to include 15 to 20 turret lathes.

Inquiries from the Cleveland Union Terminals Co., listing 25 tools, and from the United States Air Corps, Dayton, Ohio, for seven lathes, are still pending.

Machine tool plants have accumulated enough orders in the past few months to operate at a high rate during July and August, even if bookings should decline considerably in the near future, a development which is not expected.

New York

NEW YORK, July 9.—Machine tool business in the first week of July has held up remarkably well. The holiday last week did not make the difference in the volume of orders that might have been expected. Orders are coming from widely diversified classes of users. For example, last week business was placed by such varied lines of manufacture as printing machinery, electric lamps, reduction gears, motor trucks, airplanes, conveying equipment, automobile trunks, steel, radios, ball bearings. While there was no outstanding buying, some orders called for two or three machines.

Ingersoll-Rand Co., 11 Broadway, New York, manufacturer of air compressors, rock drills, pumps, etc., has plans for one-story addition to Cameron plant at Phillipsburg, N. J., totaling about 36,000 sq. ft. floor space. A two-story unit, 40 x 140 ft., will also be erected for office and operating service. Entire expansion will cost over $100,000 with equipment.

Department of Parks, Arsenal Building, Sixty-fourth Street and Fifth Avenue, New York, W. R. Herrick, commissioner, will soon ask bids for a power house and service building, to cost more than $125,000 with equipment. Trowbridge & Livingston, 527 Fifth Avenue, are architects.

Metropolitan Engineering Co., 1250 Atlantic Avenue, Brooklyn, manufacturer of protective equipment and devices, has awarded general contract to S. F. Musselwhite, 806 St. Johns Place, for two-story plant unit, to cost about $45,000 with equipment. E. W. Helms, 88 Lexington Avenue, New York, is architect.

General Gas & Electric Corporation, 50 Pine Street, New York, operating electric light and power properties, has arranged for a preferred stock issue to total $23,750,000, part of proceeds to be used for expansion. Lexington Water Power Co., a subsidiary, has work under way on a hydroelectric power project on Saluda River, near Columbia, S. C., to cost more than $15,000,000 with transmission system.

Superior Fireproof Door & Sash Co., 1811 Carter Avenue, New York, manufacturer of metal-covered sash, doors, etc., will proceed with superstructure for a two-story plant, 100 x 200 ft., to cost about $140,000 with equipment. H. Ginsberg, 205 West Forty-second Street, is architect.

Moto-Meter Gauge & Equipment Co., 11 Wilbur Avenue, Long Island City, manufacturer of automobile accessories, is said to be planning an addition to cost over $50,000 with equipment.

New York Central Railroad Co., 466 Lexington Avenue, New York, will develop plans for electrification of west side freight line from Seventy-second Street to Spuyten Duyvil, and has been granted until January, 1931, to finish project. Engineering department is in charge.

Long Island Lighting Co., 50 Church Street, New York, operating electric light and power properties on Long Island, is arranging for a preferred stock issue to total $4,000,000, part of proceeds to be used for expansion.

Pioneer Instrument Co., 754 Lexington Avenue, Brooklyn, manufacturer of aviation flight and other navigation instruments, has awarded general contract to R. J. Murphy, Inc., 55 West Forty-second Street, New York, for addition to plant, including improvements in present factory to cost about $60,000 with equipment. Ralph H. Segal, 475 Fifth Avenue, New York, is architect. Company has been merged with Bendix Aviation Corporation, South Bend, Ind., affiliated with Bendix Brake Co., same address, and will be operated as unit of that organization. Further expansion is planned. Bendix company has also secured Eclipse Machine Co., 545 North Arlington Avenue, East Orange, N. J., manufacturer of starting equipment, generators, etc., for aircraft.

Brunswick Laundry, 222 Tonnele Avenue, Jersey City, N. J., will soon take bids for power house addition, 85 x 100 ft., installation to include a 500-hp. boiler unit with accessories, 600-kw. engine-generator, and auxiliaries. P. Simeone & Co., Inc., 22 Journal Square, is architect and engineer.

Elizabeth Iron Works, Inc., 137 Franklin Street, Elizabeth, N. J., is planning establishment of new iron and steel fabricating plant to cost about $40,000 with equipment. Present works will be removed to new location and capacity increased.

Lubrication Purification Sales Co., Third and Creek Streets, Long Island City, manufacturer of lubricating devices and equipment, has purchased property on Kings Wood Road, Weehawken, N. J., and is reported planning new factory to cost over $45,000 with equipment.

Board of County Freeholders, Morristown, N. J., has purchased property, 75 x 250 ft., improved with one-story building, at Mendham, for central machine and repair shop, and storage plant for road machinery and other equipment. Additional buildings are planned.

Newhall Chain Forge & Iron Co., 9 Park Place, New York, has purchased chain shop and other buildings of Rensselaer Chain Works, Rensselaer, N. Y. Rensselaer chain shop has been operated by Newhall company for several years. Newhall Chain Forge & Iron Co. is a division of Henry B. Newhall Corporation, Garwood, N. J., other divisions being Diamond Expansion Bolt Co. and New Jersey Foundry & Machine Co.

Charles Ahr Co., Inc., Lincoln, N. J., has been incorporated and will continue manufacture of forged products formerly made by Charles Ahr. F. P. MacKay is secretary-treasurer.

Buffalo

BUFFALO, July 8.—Firestone Tire & Rubber Co., Akron, Ohio, has plans for a three-story and basement factory branch and distributing plant at Buffalo, to cost about $150,000 with equipment. Lockwood, Greene Engineers, Inc., Hanna Building, Cleveland, is architect and engineer.

A. O. Fleet, Buffalo, will establish a new welding shop at 1681 Fillmore Avenue.

Lionite Abrasive Co., a subsidiary of General Abrasive Co., Niagara Falls, N. Y., has acquired 8-acre tract at Niagara Falls, Ont., and plans construction of new plant to cost over $100,000 with equipment. Allen V. Parker is president of Lionite organization.

John P. Todd, 1105 East Genesee Street, Syracuse, N. Y., and associates have organized Twentieth Century Aircraft Corporation, and plan early operation of local plant to manufacture airplanes and parts.

Universal Wireless Communication Co., Liberty Bank Building, Buffalo, William H. Fitzpatrick, chairman of board, will soon take bids for first unit of a radio transmitting station at Akron, N. Y., including steel towers, power plant, etc., to cost over $75,000. G. Morton Wolfe, 1377 Main Street, Buffalo, is architect.

Philadelphia

PHILADELPHIA, July 8.—Bids will be asked at once by United Motors Service, Inc., 342 North Broad Street, Philadelphia, subsidiary of General Motors Corporation, Detroit, for two-story service, repair and sales building, to cost over $150,000 with equipment. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Quaker City Iron Works, Tioga and Richmond Streets, Philadelphia, has acquired property, 200 x 353 ft., on Ontario Street, and 25 x 253 ft., on Tioga Street, for expansion.

Wilkening Mfg. Co., Fifteenth Street and Mount Vernon Avenue, Philadelphia, manufacturer of piston rings, radio equipment, etc., has awarded general contract to France & Messar, Inc., 6725 Yocum Street, for one-story addition, to cost about $25,000.

Atwater Kent Mfg. Co., Philadelphia, manufacturer of radio equipment and parts, has filed plans for a one-story and basement power plant, arranged in two units, 68 x 96 ft. and 60 x 71 ft., to cost about $250,000 with equipment. Ballinger Co., Twelfth and Chestnut Streets, is architect and engineer.

William M. Connery, president of Connery & Co., Second and Luzerne Streets, Philadelphia, manufacturer of boilers, tanks, etc., and associates have organized Connery Clarifying Equipment Co., a subsidiary, to manufacture iron and steel tanks and kindred equipment for clarifying and distilling oils and other solvents. Mr. Connery will be president of new organization; Edgar C. Aucott is treasurer.

Wilckes-Martin-Wilckes Co., Fifteenth and Pine Streets, Camden, N. J., manufacturer of lamp black and kindred products, is planning to rebuild part of plant destroyed by fire July 3, with loss reported at $100,000 including equipment. Headquarters are at 135 William Street, New York.

John A. Roebling's Sons Co., Trenton, N. J., manufacturer of wire rope, cables, etc., has awarded general contract to J. W. Ferguson Co., Paterson, N. J., for one-story addition, to cost about $125,000 with equipment.

Philadelphia Electric Co., Tenth and Chestnut Streets, Philadelphia, has plans for new power substations and switching plants at Bristol, Phoenixville and Wyncote, Pa., each to cost about $65,000 with equipment. Work will be carried out under direction of United Engineers & Constructors, Inc., 112 North Broad Street, an affiliated organization.

John F. O'Toole, 1107 Marion Street, Scranton, Pa., and associates have organized Electric City Mfg. Co., and plan early operation of local factory to manufacture electrical appliances and equipment. James J. Wisely, 614 Wheeler Avenue, and John J. Schofield, 1013 Bennett Street, are interested in new company.

Harrisburg Gas Co., Fourteenth Street and Market Square, Harrisburg, Pa., has plans for a one and three-story equipment storage and distributing plant, with repair department, to cost more than $70,000 with equipment. United Engineers & Constructors, Inc., 112 North Broad Street, Philadelphia, is architect and engineer.

The Crane Market

THE Fourth of July holiday was partially responsible for a quiet week in the crane market. The only feature was the purchase of 12 cranes by the Libbey-Owens Sheet Glass Co., Toledo, Ohio. The Bucyrus-Erie Co., Milwaukee, has bought a 20-ton foundry crane and a 7½-ton and a 3-ton crane. Most of the requirements of the Steel Corporation subsidiaries, which earlier in the year were estimated at 40 or more cranes, are yet to be placed. They include 29 cranes for the projected rebuilding of the McKeesport, Pa., plant of the National Tube Co. and a number of cranes for the Pittsburgh and Youngstown district plants of the Carnegie Steel Co. The Gulf States Steel Co., Alabama City, Ala., and the Great Lakes Steel Corporation, Detroit, are expected to buy cranes soon. Crane builders are busy and indications point to a continuance of this condition for the next three months or longer. Deliveries are reported to be more extended than a few weeks ago.

Recent purchases include:

Libbey-Owens Sheet Glass Co., Toledo, Ohio, 12 cranes from Cleveland Crane & Engineering Co.

Bucyrus-Erie Co., Milwaukee, 20-ton foundry crane and 7½-ton and 3-ton cranes from Milwaukee Electric Crane & Mfg. Corporation.

Taylor Forge & Pipe Works, Chicago, 10-ton magnet crane from Whiting Corporation.

Carnegie Steel Co., 10-ton bucket handling crane for Clairton works from Morgan Engineering Co.

St. Louis

ST. LOUIS, July 8.—Bids will soon be asked by Missouri Pacific Railway Co., Missouri Pacific Building, St. Louis, for new coaling station, storage and distributing plant at Durand, Kan., to cost about $40,000 with conveying, elevating and other equipment. E. A. Hadley is chief engineer.

Kansas City Tank Car Co., Kansas City, Mo., recently organized, has acquired local plant of Mid-Continent Tank Car Co., Tenth and Cherry Streets, for establishment of main works. Plans are under way for extensions, including one-story unit, to cost about $45,000 with equipment.

Board of Education, East St. Louis, Ill., has authorized installation of manual training department in new two and three-story junior high school at Caseyville Avenue and Fortieth Street, to cost over $300,000. W. J. Kennedy, First National Bank Building, East St. Louis, and N. S. Spencer & Son, 180 North Michigan Avenue, Chicago, are associated architects.

J. E. Crosbie, Central National Bank Building, Tulsa, Okla., and associates are said to be planning construction of oil refinery in Cary pool district, Okfuskee County, to cost about $90,000 with equipment.

Board of Trustees, Creighton University, Omaha, Neb., have plans for a new power house, to cost about $100,000 with machinery. L. A. Daly, Peters Trust Building, is architect.

McKecknie & Trask, Board of Trade Building, Kansas City, Mo., architects, will proceed with superstructure for an eight-story and basement automobile service, repair and garage building, to cost over $200,000 with equipment. Frank L. Brown, Orear-Leslie Building, is engineer.

Plant of United Iron Works Co., Iola, Kan., has been purchased by a group of local men who will operate it under name of Kirk-Morrow Iron Works Co. J. B. Kirk will be president.

Pittsburgh

PITTSBURGH, July 8.—While there has been some falling off in machine tool orders the past week, this is regarded merely as seasonal rather than a decline in requirements. More than 25 tools remain to be bought by the Aluminum Co. of America for its New Kensington works, and the Westinghouse Electric & Mfg. Co., has just completed its third quarter machine tool inquiry, which was issued in sections and contains over 100 items. This is easily the largest list the company has put out in recent years and it is interesting to note that some items are included which were originally intended to go into the inquiry for the last quarter of the year.

Deliveries of some classes of tools are not as prompt as at the beginning of the year, and some demands now are developing which call for earlier shipment than manufacturers dare to promise. Quotations are in on a large list for the Christy Park works of the National Tube Co. The Youngstown Sheet & Tube and Republic Iron & Steel companies are expected to be good buyers in the next few months. The steel and metal working industries are providing a good market for machine tools at present.

Contract has been let by Miller Printing Machinery Co., Reedsdale Street, North Side, Pittsburgh, to D. T. Riffle, 1007 Forbes Street, for one and two-story and basement plant unit, 50 x 175 ft., to cost over $70,000 with equipment.

Westinghouse Electric Elevator Co., East Pittsburgh, subsidiary of Westinghouse Electric & Mfg. Co., has purchased plant and business of Norton-Blair-Douglas, Inc., 432 West Forty-fifth Street,

New York, manufacturer of electric and manual door operators, elevator signal systems, etc., and will consolidate. It is proposed to continue acquired plant at present location.

Wilson-Snyder Mfg. Corporation, recently organized as an interest of Oil Well Supply Co., Clark Building, Pittsburgh, to take over and operate Wilson-Snyder Mfg. Co., Braddock, Pa., manufacturer of oil pumping machinery and parts, has disposed of bond issue of $850,000, part of fund to be used for expansion.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, has awarded general contract to Public Service Production Co., 80 Park Place, Newark, N. J., for two additions to Newark branch plant, two stories, 81 x 100 ft., and one story 35 x 85 ft., to cost about $150,000 with equipment.

Hunter Steel Co., Pittsburgh, recently organized by A. W. McCandless, 620 Frick Building, and associates, plans operation of local iron and steel plant, primarily for fabricating.

Ruud Mfg. Co., Twenty-ninth and Smallman Streets, Pittsburgh, manufacturer of automatic gas water heaters, parts, etc., has arranged for an additional stock issue to total about $924,000, part of fund to be used for extensions. Work is under way on new two-story building and other facilities, to increase capacity about 20 per cent.

New England

BOSTON, July 8.—The past week was the quietest experienced so far this year by the machine tool trade. The national holiday and the closing of many plants from July 3 until today, with others busy on inventories or repairs, resulted in a marked shrinkage in inquiries. None of the local new tool houses reported any sales of importance. Business in used tools was largely confined to small equipment.

Fafnir Bearing Co., New Britain, Conn., is equipping an addition, and has plans for expansion in a Western subsidiary plant.

Barnum Forge Co., Stratford, Conn., has started work on a one-story forge shop, 60 x 97 ft.

Stamford Hall Sanatorium, North Stamford, Conn., has plans for a power house, 70 x 100 ft., to cost $50,000 with equipment.

Connecticut Power Co., Court and Broad Streets, Middletown, Conn., is revising plans for a two-story service station, 130 x 140 ft.

Taber Cadillac Co., Albany Avenue and Westbourne Parkway, Hartford, Conn., has awarded contract for a service department, 140 x 180 ft.

New England Flexible Door Co., Hartford, Conn., will occupy building of Automatic Refrigerator Co., Capitol Avenue and Laurel Street. Company has been located at Winsted, Conn.

Terry Steam Turbine Co., Windsor Street, Hartford, Conn., has plans for a one-story boiler plant, to cost over $50,000 with equipment. Westcott & Mapes, Inc., 139 Orange Street, New Haven, Conn., is engineer.

Moth Aircraft Corporation, South Lowell, Mass., manufacturer of light aircraft and parts, is considering an expansion program, including new buildings and equipment to double present capacity, to cost over $75,000. Minton M. Warren is president. Company has recently become a unit in Curtiss-Wright Corporation merger of aircraft companies.

Holyoke Water Power Co., Holyoke, Mass., has authorized plans for a new hydroelectric generating plant near mill of American Writing Paper Co., to cost over $100,000 with machinery.

Heald Machine Co., New Bond Street, Worcester, Mass., manufacturer of grinding machines, etc., has awarded general contract to E. J. Cross Co., Worcester, for one-story addition, 105 x 360 ft., to cost $100,000 with equipment.

Central Vermont Railway Co., St. Albans, Vt., has plans for new engine house, with repair facilities, at White River Junction, Vt., to cost about $50,000 with equipment. P. D. Fitzpatrick is chief engineer.

State Airport Commission, Providence, R. I., has authorized purchase of 350-acre tract in Hillsgrove section of Warwick, for State airport and flying field, and will have plans drawn at once for hangars, repair shop, oil storage and other buildings, to cost $145,000 exclusive of land.

J. B. Welch, 44 School Street, Boston, has awarded general contract to Thomas Mulcare, Inc., 66 Western Avenue, Brighton, Mass., for one-story foundry at Cambridge, to cost about $25,000 with equipment.

Rising Paper Co., Housatonic, Mass., has awarded general contract to J. R. Hampson & Co., Inc., 184 North Street, Pittsfield, Mass., for addition to mill at Great Barrington, Mass., to cost over $65,000 with equipment.

South Atlantic

BALTIMORE, July 8.—H. F. Baldwin, 339 St. Paul Street, Baltimore, architect, has asked bids on general contract for a three-story automobile service, repair and garage building, to cost about $150,000 with equipment. Kubitz & Koenig, Emerson Tower Building, are engineers.

Chesapeake & Ohio Railway Co., Richmond, Va., has awarded general contract to John W. Cowper Co., Inc., State Planters' Bank Building, for extensions and improvements in terminal and shops at Hinton, W. Va., to cost about $130,000 with equipment. C. W. Johns is chief engineer.

Continental Can Co., 1 Pershing Square, New York, has purchased plant and business of Eastern Shore Can Co., Hurlock, Dorchester County, Md., and will consolidate. Factory will be continued at present location and plans are under way for expansion.

Pennsylvania Water & Power Co., Lexington Building, Baltimore, is said to have plans for hydroelectric power plant at Safe Harbor, about 9 miles from Holtwood, Pa., to supplement similar generating station and steam power stand-by plant at last noted place, to cost more than $1,000,000.

Air Propellers, Inc., Hagerstown, Md., recently formed by Edwin J. Smead, 1134 Oak Hill Avenue, and associates, plans early operation of local factory to manufacture aircraft propellers and kindred airplane equipment.

Flintkote Co., Park Square Building, Boston, manufacturer of roofing products, has arranged for purchase of Atlanta plant of Logan-Long Co., Chicago, manufacturer of kindred specialties, and will take immediate possession. New owner will continue operation as a factory branch and plans expansion. C. E. Rahr is president of purchasing company.

American Oil Co., American Building, Baltimore, has revised plans for a new storage and distributing plant at Atlantic City, N. J., to cost about $80,000 with equipment. Company will also construct two new units at similar plant at Liberty Heights, Baltimore, to cost about $30,000 with equipment. T. J. O'Connell is company architect and engineer.

City Council, Concord, N. C., is asking bids until July 16 for equipment for municipal waterworks, including steel water tank and tower, electrically operated pumping machinery and auxiliary equipment.

Claude Neon Southern Corporation, Atlanta, Ga., has been organized to take over and consolidate Claude Neon Lights, Inc., Atlanta; Munn Sign & Advertising Co., Atlanta; and Elliott Claude Neon Lights of Florida, Inc., Miami and Tampa, Fla., all specializing in manufacture of electric signs and displays. Plans are in progress for expansion, including extensions in Munn plant at Atlanta, and establishment of new plants in Alabama and North and South Carolina. Miami and Tampa plants will be continued with increased production facilities. Entire program will cost more than $350,000. New company will be affiliated with Claude Neon Lights of New York, Inc., 50 East Forty-second Street, New York. R. L. Kester, Jr., vice-president of last noted, will be president of Southern organization; E. Frank Munn, Atlanta, heretofore president of Munn Sign & Advertising Co., will be vice-president.

Birmingham Machine & Foundry Co. and Joubert & Goslin Machine & Foundry Co., Birmingham, both engaged in manufacture of sugar mill machinery, have been consolidated as Goslin-Birmingham Mfg. Co.

Chicago

CHICAGO, July 8.—Sales the past week were in small volume, but in view of the amount of business in sight, dealers are inclined to account for this because of the holiday rather than as an indication of a sharp recession in the market. Inquiries before the trade bulk large and foreshadow a fair volume of sales in the coming months.

A buying program by one large farm machinery manufacturer is rapidly taking form. Generally, however, farm implement producers are moving with greater caution. Radio manufacturers are nearing the end of equipment purchases for fall production schedules. It is reported that a Western motor car builder is preparing to enter the market for a large number of machine tools. Deliveries are slowly improving. Demand for used tools is lighter but the supply is short and few prospective buyers are able to fill their needs.

R. C. Lydy, 205 West Wacker Drive, Chicago, will build a two-story garage, 101 x 181 ft., to cost $150,000.

Peoples Gas, Light & Coke Co., 122 South Michigan Avenue, Chicago, will build a steel gas holder, 123 ft. in diameter, to cost $123,000.

Western Electric Co., Hawthorne Station, Chicago, will erect a one-story addition, 91 x 120 ft., to cost $65,000. C. B. Barnes, Hawthorne Station, is architect.

Carlson Forging Co., 727 Fulton Street, Chicago, is erecting a plant unit to cost

$75,000. G. Kehl Sons have the general contract.

Englander Bed Spring Co., Fortieth Street and Low Avenue, Chicago, was partly destroyed by fire June 28, with loss estimated at $250,000.

Klein Mfg. Co., Burlington, Iowa, manufacturer of poultry equipment and hardware, is erecting an addition, 108 x 160 ft., to cost $30,000. About $10,000 will be expended for machinery and other equipment.

Kewanee Mfg. Co., 401 Tremont Street, Kewanee, Ill., manufacturer of laboratory furniture and other metal equipment, has taken bids on general contract for a one-story addition, to cost about $60,000 with equipment. Frank D. Chase, Inc., 720 North Michigan Avenue, Chicago, is architect and engineer.

Buda Co., Harvey, Ill., manufacturer of railroad equipment and supplies, engines, etc., has awarded contract to Austin Co., Cleveland, for one-story addition, to cost about $35,000.

Ruth Automatic Garage, Inc., 38 South Dearborn Street, Chicago, has awarded general contract to J. B. French Co., 30 North Michigan Avenue, for multi-story service, repair and garage building, to cost about $800,000 with equipment. A. S. Graven, Inc., 100 North La Salle Street, is architect.

International Harvester Co., 606 South Michigan Avenue, Chicago, has awarded general contract to G. E. Larson, Carver Building, Fort Dodge, Iowa, for one and three-story factory branch and distributing plant at Fort Dodge, to cost $160,000 with equipment. W. D. Price is superintendent of construction, in charge.

Chamber of Commerce, Cedar Rapids, Iowa, has approved plans for buildings for municipal airport, including hangar, machine and repair shop, and other structures, to cost about $50,000 with equipment. Earl Muzzy is chairman of committee, in charge.

Gardner-Denver Co., East Thirty-ninth Avenue, Denver, manufacturer of rock drills, mining machinery, etc., has authorized a one-story addition to branch plant at Quincy, Ill., totaling 40,000 sq. ft. floor space, to cost more than $100,000 with equipment.

Kunzel-Lenz Electric Mfg. Co., 1751 North Western Avenue, Chicago, has plans for a one-story addition, to cost about $40,000 with equipment. Zimmerman, Saxe & Zimmerman, 212 East Superior Street, are architects.

Board of Education, Quincy, Ill., is considering installation of manual training equipment in new high school, to cost $500,000, for which bids will be asked on general contract in about 30 days. Behrensmeyer & Haffner, W. C. U. Building, are architects.

Cleveland

CLEVELAND, July 8.—While demand for machine tools continues to taper slowly, business is still good. More seasonal slowing down in orders is looked for this month and during August. Deliveries of some lines have improved but on others show no appreciable change. Business is well diversified, although little is coming at present from the automotive industry. There is still a fair amount of buying by the airplane industry.

Definite inquiries have come through the Amtorg Trading Co., New York, for machine tool equipment for a large tractor plant to be built in Russia. Requirements will include 15 to 20 turret lathes. No new domestic inquiries of any size came out during the week. Lists of the Cleveland Union Terminals Co., containing 25 machines, and the seven lathes inquired for by the United States Air Corps, Dayton, Ohio, are still pending.

Bids have been asked on general contract by Cleveland Universal Jig Co., 2005 Rockwell Avenue, Cleveland, for one and two-story plant unit, to cost about $45,000 with equipment. Kalsch & Hoeffler, 4500 Euclid Avenue, are architects and engineers.

Patterson Foundry & Machine Co., East Liverpool, Ohio, is said to have plans for one-story addition to machine shop, to cost more than $50,000 with equipment.

Timken Roller Bearing Co., Canton, Ohio, has awarded general contract to Melbourne Construction Co., 225 Tuscarawas Street, West, for one-story addition 220 x 440 ft., to cost $225,000 with equipment.

Board of Education, Euclid Village, Ohio, is said to be planning installation of manual training equipment in three-story addition to high school, to cost $300,000, for which bids are being asked on general contract until July 15. Fulton & Taylor, 8120 Euclid Avenue, Cleveland, are architects.

Firestone Tire & Rubber Co., Akron, Ohio, has awarded general contract to Carmichael Construction Co., Central Savings & Trust Building, for two-story addition, to cost about $150,000 with equipment. Company is said to be planning other units later. Work has begun on two additions to branch mill at South Gate, near Los Angeles, to cost about $200,000 with machinery.

Patterson Steel Products Co., East Liverpool, Ohio, newly organized, has awarded contracts for a new building to cost $150,000, on a two-acre site. Company will manufacture forged and welded steel products, and part of its output will be taken by Patterson Foundry & Machine Co., jointly owned. D. G. Rhue, formerly of Morgan Engineering Co., Alliance, is general manager of new company.

Barnett Iron & Metal Co., Barberton, Ohio, has changed its name to I. A. Barnett Co.

Cincinnati

CINCINNATI, July 8.—The usual midsummer let-up in business has affected the machine tool market in this district and the brisk demand of a week ago has simmered down into an ordinary run of orders. A large manufacturer of lathes, who up to a week ago had maintained production well above normal, has reduced his daily output. Although fresh bookings are mostly for one or two machines, orders on hand are of sufficient volume to keep plants in operation throughout the summer.

Board of Works, City Hall, Columbus, Ohio, has awarded general contract to George H. Moor, Columbus, for hangar at municipal airport, with shop facilities, to cost $100,000 with equipment. Allied Architects Association, A. I. U. Building, is architect; W. H. Duffy is service director.

Union Solvents Corporation, Cincinnati, has been organized by Bernard E. Pollak, formerly an official of Pollak Steel Co., Temple Bar Building, and associates, to manufacture industrial alcohol, acetone and kindred products. Plant of Roseville Commercial Alcohol Corporation, Carthage, Ohio, has been purchased where initial production will be carried out.

Board of Education, Lebanon, Ohio, is considering installation of manual training equipment in two-story high and grade school, to cost $250,000, for which bids are being asked on general contract until July 24. Samuel Hannaford & Sons, Dixie Terminal Building, Cincinnati, are architects.

Commissioner of Public Utilities, Grounds and Buildings, City Hall, Chattanooga, Tenn., has plans for a hangar, 100 x 120 ft., with shop facilities and other units at municipal airport, Lovell field, to cost more than $50,000. Benjamin King & Associates, Hotel Patten, Chattanooga, and 1637 Massachusetts Avenue, N. W., Washington, are airport engineers in charge.

Stuebing-Cowan Co., 312 East Court Street, Cincinnati, manufacturer of electric lift trucks, tractors, platforms, etc., has work under way on first unit of new plant, one story, 160 x 300 ft., on 4-acre tract, with two-story office building, to cost about $200,000 with equipment. Other units are planned.

Girdler Corporation, Goss Avenue and Shelby Street, Louisville, recently organized by Walter H. Girdler and associates, will take over and consolidate Kentucky Oxygen Co., Vogt Instant Freeze Corporation, Vogt Processes, Inc., Cherry-Burrell-Vogt Co., and Helium Co., all with plants in this vicinity. Consolidated corporation will have assets of about $5,000,000, and will specialize in production of ice cream freezers, freezing machinery, helium gas specialties, commercial oxygen, etc. Expansion is planned. Mr. Girdler will be president of new company.

Marr & Holman, Stahlman Building, Nashville, Tenn., architects, have plans for six-story automobile service, repair and garage building, 100 x 175 ft., to cost over $200,000 with equipment.

W. H. Davis Die Co., 229 East Sixth Street, Cincinnati, has been incorporated to make cutting dies on contract. Harry A. Wiechman is vice-president.

Milwaukee

MILWAUKEE, July 8.—Production of machine tools continues at the high rate of recent months, with most shops unable to make any appreciable gains in delivery. New business is in good volume, although probably not so heavy as earlier in the year. However, nearly every line of metal working is represented, and while individual orders are small, the aggregate is large for this season of the year. The local pay-roll at the beginning of July was 253 less than on June 1, but nearly 7000 above a year ago.

Lakeside Bridge & Steel Co., Thirty-third Street and Lincoln Avenue, Milwaukee, is starting work on three shop extensions, 92 x 174 ft., 60 x 134 ft., and 40 x 67 ft., all 41 ft. high, costing about $40,000 without equipment. Charles G. Margwarth is vice-president and general manager.

S. Heller Elevator Co., 250 Milwaukee Street, Milwaukee, manufacturer of freight and passenger elevators, etc., has plans by W. Fred Dolke, Jr., consulting engineer, 9 S. Clinton Street, Chicago, for a third story addition and general alterations and improvements in plant and adjoining buildings recently acquired. About $50,000 will be spent for buildings and equipment. Leo K. Glueckstein is president.

Chicago & North Western Railway, 99 East Wisconsin Avenue, Milwaukee, is about to begin work on a $300,000 freight station and warehouse at Milwaukee.

Magnetic Mfg. Co., Milwaukee, is planning an addition to cost $30,000 with equipment. Machine tools will be purchased.

Karl Mfg. Co., Milwaukee, is being organized with $150,000 capital stock to manufacture metal appliances and devices for gas industry designed by Ray E. Gest, 899 Fifth Street, local. Company expects to start production about Oct. 1.

Northern Conveyor & Mfg. Co., Janesville, Wis., has broken ground for an extension, 40 x 157 ft. About $50,000 will be invested.

Milwaukee Specialty Co., 2017 Clybourn Street, Milwaukee, manufacturer of gas stove lighters and other appliances, will place contracts about July 15 for one-story shop extension, 35 x 73 ft., designed by Julius Leiser, architect, 105 Wells Street.

Acme Metal & Scrap Iron Co., 497 Virginia Street, Milwaukee, has plans by H. L. Kuehnel, consulting engineer, 4625 Woodlawn Court, for a one-story shop and warehouse addition, 45 x 110 ft.

Milwaukee Forge & Machine Co., Milwaukee, is having plans prepared for an addition.

Detroit

DETROIT, July 8.—Bids will soon be asked on general contract by Auto Specialties Mfg. Co., Edgewater Street, St. Joseph, Mich., for one-story addition, to cost over $350,000 with equipment. F. E. Davidson, 53 West Jackson Boulevard, Chicago, is architect and engineer.

Oakland Motor Car Co., Pontiac, Mich., has plans for a one-story addition to cost about $190,000 with equipment. Another one-story unit will also be constructed for storage and distribution, to cost $50,000.

Story & Clark Piano Co., Grand Haven, Mich., contemplates rebuilding part of local plant recently destroyed by fire. Company has lately become a unit of Walbert Mfg. Co., Chicago, manufacturer of radio equipment and parts.

Board of Education, 1354 Broadway, Detroit, will soon begin construction of one-story and basement addition to power plant on Linwood Avenue, to cost about $75,000 with equipment.

International Aircraft Co., Oncor, near Cincinnati, operating a local plant for parts production and assembling of airplanes, has plans for new plant at Reynolds field, municipal airport at Jackson, Mich., to cost more than $85,000 with equipment. Present works will be removed to new location and capacity increased. T. P. Funk chairman of board of Automotive Fan & Bearing Co., Jackson, is president of International company; D. G. Morrison, formerly general manager of Morrison Metal Stamping Co., is vice-president and general manager.

Campbell, Wyant & Cannon Foundry Co., Muskegon, Mich., manufacturer of heavy iron and steel castings, is concluding arrangements for purchase of plant and business of National Motor Castings Co., South Haven, Mich., manufacturer of pistons and other foundry products for automobiles, and will consolidate. Expansion will be carried out.

Department of Public Lighting, 138 East Atwater Street, Detroit, has plans for a one-story equipment storage and distributing plant to cost about $150,000 with equipment; repair facilities will be provided. Smith, Hinchman & Grylls, Marquette Building, are architects and engineers.

Ainsworth Mfg. Corporation, Dubois and Franklin Streets, Detroit, manufacturer of automobile metal stampings, is concluding negotiations for acquisition of Joseph N. Smith & Co., 5914 Federal Avenue, manufacturer of automobile locks, hinges, etc., and will consolidate. Purchasing company is arranging for additional stock issue, part of proceeds to be used for expansion in production.

Detroit Aircraft Corporation, Detroit, has organized and purchased 90 per cent of capital stock of Blackburn Aircraft Corporation of Michigan, which will manufacture commercial airplanes and flying boats. Blackburn Airplane & Motor Co., Ltd., of England, has agreed to assign design and patent rights to latter on entire line of Blackburn metal aircraft for North and South America, with exception of Brazil.

Tyler-Chapman Engineering Co., 3555 Holcomb Avenue, Detroit, has been organized to succeed Tyler Engineering Service. Company will specialize in designing and building of machinery and fixtures, and will also produce several products on which it owns patent rights, such as a drill press, multiple spindle drilling heads, drilling machinery and full automatic single spindle drill units. Tracey Brooks Tyler is president.

Gulf States

BIRMINGHAM.—Plans are being completed by Texas Aero Corporation, Temple, Tex., for new aircraft plant at Love Field, Dallas, Tex., with initial unit for parts production and assembling to cost about $100,000 with equipment. Factory at Temple will be removed to new location. Roy Sanderford is general manager.

Central Foundry Co., Eighth Avenue, Bessemer, Ala., has plans for a one-story addition at cast iron pipe plant, to cost about $20,000.

War Department, Washington, has begun work on army airport and aviation school on property about 5 miles square, near San Antonio, Tex., for which Congress recently granted appropriation of $7,531,000, to be increased to $14,000,000, estimated cost of development. Hangars and shops will be constructed to provide for 250 airplanes at one time with other units for aircraft building, oil storage, etc. Site will be known as Randolph Field and will include complete housing development for about 5000 persons.

Board of Education, Humble, Tex., plans installation of manual training equipment in new two-story high school to cost $150,000, for which superstructure will begin at once. Harry D. Payne, Kirby Building, Houston, Tex., is architect.

Bryan Compress Co., Bryan, Tex., has purchased local property as site for new cotton compress plant, to cost about $40,000 with equipment.

J. M. Spain, Millsaps Building, Jackson, Miss., architect, has awarded general contract to W. G. Wetmore Construction Co., Jackson, for two-story automobile service, repair and garage building, to cost about $100,000 with equipment.

United Carbon Co., Union Building, Charleston, W. Va., has approved construction of two new units at carbon black plant at Borger, Tex., to cost more than $90,000 with compressors and other equipment.

Southern Air Transport, Inc., Fort Worth National Bank Building, Fort Worth, Tex., subsidiary of Aviation Corporation of the Americas, Inc., 100 East Forty-second Street, New York, is planning aircraft school near San Antonio, Tex., initial units to consist of two hangars, each 100 x 200 ft.; machine and repair shop, 80 x 100 ft.; administration building and other structures, to cost over $175,000 with equipment. A. P. Barrett is president of Southern company.

Texas Citrus Fruit Growers' Exchange, Mission, Tex., plans installation of conveying machinery and other equipment in one-story packing plant, 100 x 125 ft., at La Feira, Tex., to cost $75,000. H. P. Smith, National Bank of Commerce Building, San Antonio, Tex., is architect.

New Orleans Public Service, Inc., Baronne and Union Streets, New Orleans, has revised plans for two-story equipment storage and distributing plant, 75 x 150 ft., with repair facilities, to cost over $85,000. Clark Steen, Balter Building, is architect.

Greenwood International Co. Greenwood, Miss., local representative for International Harvester Co., Chicago, has awarded general contract to Ferguson Construction Co., Dermon Building, Memphis, Tenn., for one-story storage and distributing plant, 100 x 150 ft., to cost about $65,000 with equipment.

Indiana

INDIANAPOLIS, July 8.—Contract has been let by Union Drawn Steel Co., 2700 East Fifth Avenue, Gary, to General Construction Co., 479 Broadway, for one-story addition, to cost more than $45,000 with equipment.

Warner Gear Co., Muncie, manufacturer of automobile gears and assemblies, has awarded general contract to Albert J. Glaser, 610 Jefferson Street, for one-story addition, 150 x 400 ft., to cost about $100,000 with equipment.

Excelsior Wire Works, Inc., 319 West Maryland Street, Indianapolis, manufacturer of wire goods, bird cages, etc., has leased space in building at Nineteenth Street and Martindale Avenue, totaling 15,000 sq. ft. floor space, for new plant, and will remove to new location.

Indian Refining Co., Lawrenceville, Ill., has plans for two-story oil storage and distributing plant at Fort Wayne, to cost about $60,000 with equipment.

City Council, Elkhart, is considering establishment of municipal airport, including hangar, repair shop and other operating units, to cost over $50,000 with equipment.

Board of Trustees, Indiana State Prison, Michigan City, has authorized installation of plant at institution to manufacture metal automobile license plates, road markers, etc., to cost about $65,000

Glascock Brothers Mfg Co, 1515 West Fifteenth Street, Muncie, manufacturer of bottle coolers, dispensers and kindred equipment, has asked bids on general contract for three one-story additions, 50 x 80 ft., 40 x 60 ft., and 20 x 60 ft., to cost about $45,000 with equipment.

In connection with reference in these columns last week to new foundry to be established by W. A. Gingerick and associates, typographical error occurred in plant location, given as Arkon, which should be Akron, near Peru.

Bantam Ball Bearing Co. of Connecticut, Bantam, Conn., has decided to dissolve, sell its plant and concentrate manufacturing activities at plant of Bantam

Ball Bearing Co., South Bend. Latter company's shipments and orders for first six months of 1929 were double those of any similar period since 1922.

C. & G. Foundry Co., Indianapolis, has taken over United Brass Works to enlarge its facilities. Charles J. Geisler is president.

Pacific Coast

SAN FRANCISCO, July 3.—Contract has been let by Perfect Caster Co., Long Beach, Cal., to J. D. Sherer & Son, 1865 East Anaheim Street, for one-story plant, 70 x 100 ft., to cost about $40,000 with equipment. R. D. Van Alstine, Heartwell Building, Long Beach, is architect.

Pittsburgh Plate Glass Co., Frick Building, Pittsburgh, has awarded general contract to Stone & Webster Engineering Corporation, Boston and Los Angeles, for new sheet glass plant at Santa Ana, Cal., with power house, machine shop and other departments, to cost $4,000,000 with machinery. Engineering department of company is in charge.

Board of Education San Diego, Cal., will build vocational training shops at new Herbert Hoover High School group at East San Diego, to cost $400,000, for which bids are being asked on general contract until July 29. T. C. Kistner & Co., Architects' Building, Los Angeles, and Spreckels Building, San Diego, are architects.

Chevrolet Motor Co., Detroit, has awarded general contract to F. J. Kirchoff Construction Co., 700 Lawrence Street, Denver., for factory branch, service and parts station at Salt Lake City, Utah, to cost about $180,000 with equipment.

City Council, Walla Walla, Wash., is planning establishment of municipal airport, including hangar, repair shop and other units, to cost $50,000. Bonds have been voted.

Bach Aircraft Co., Inc., Metropolitan Airport, Van Nuys, Cal., has awarded contract to George A. Chapman, Van Nuys for one-story unit, 100 x 100 ft., for parts production and assembling, to cost about $50,000 with equipment. It will replace part of plant recently destroyed by fire.

Board of Education, Los Angeles, plans manual training shop at new high school to be erected at South Gate, to cost $300,000, for which plans will be drawn by G. M. Lindsey and E. P. Eiden, Union Insurance Building, Los Angeles, associated achitects.

Municipal Light and Power Department, City Hall, Tacoma, Wash., is disposing of bond issue of $1,000,000 part of fund to be used for extensions and improvements in plans and system.

Meyer & Holler, Inc., Wright & Callender Building, Los Angeles, architects, have plans for a two-story automobile service, repair and garage building, 140 x 230 ft., to cost about $200,000 with equipment.

Canada

TORONTO, July 8.—Contracts will be awarded soon for additions and improvements to plant of Hull Iron & Steel undries, Ltd., Montcalm Street, Ottawa, Ont., to cost $200,000.

Folwell Engineering Co. has been awarded contract by Harbor Commissioners, Halifax, N. S., for addition to local grain elevator to cost between $3,000,000 and $4,000,000.

A two-story pumping station will be erected on Gouin Boulevard East for city of Montreal, to cost $107,000.

Additional airport construction is reported for city of Toronto. Canadian Airways will spend $100,000 on construction of an aerodrome; DeHaviland Aircraft Co. will spend $42,000 on an aerodrome and $100,000 on construction of a new plant; Canadian Colonial Airways have started work on an aerodrome to cost $100,000.

Ratepayers of Brantford, Ont., have authorized expenditure of $400,000 for a mechanical water filtration plant. Norman R. Wilson is waterworks engineer; W. S. & R. S. Lee, 1226 University Avenue, Montreal, are consulting engineers.

Anglo Canadian Wire Rope Co., Fairview Avenue, Lachine, Que., has started work on a one-story factory addition.

Consumers Gas Co., 19 Toronto Street, Toronto, has awarded general contract to Wells and Gray Ltd., Confederation Life Building, for a boiler and compressor building to cost $40,000.

Western Canada

West Kootenay Power & Light Co. has decided to proceed with power development on Pend Oreille River south of Nelson, B. C.

City of Cardstone, Alberta, is contemplating installing a new unit in electric light plant to cost $40,000.

Pool Construction Co. has been awarded contract for erection of a parts and service building at Regina, Sask., for General Motors of Canada, to cost $175,000.

Foreign

GOVERNMENT of Chile, Santiago, has authorized a fund of 40,000,000 Chilean pesos (about $4,800,000) for development of an iron and steel plant at Port Carral, where a State company is now operating a mill. Work will include new mills and other buildings, with installation of electric furnaces and other equipment, a large part of which, it is said, will be purchased in United States. Plant will be given over to production of rails, bars, plates, wire and kindred products.

Perryman Electric Co., 33 West Sixtieth Street, New York, manufacturer of radio tubes and equipment, is planning early establishment of new plant at London, England, to cost more than $100,000 with equipment.

Ruhr Chemical Corporation, Berlin, Germany, operating process nitrogen plants for production of fertilizers, has completed arrangements for sale of bonds in United States totaling $3,000,000, large part of proceeds to be used for expansion in plants. Considerable new equipment will be installed.

Ceskomoravska Engineering Co., Prague, Czechoslovakia, manufacturer of automobile parts, chassis, etc., has formed a subsidiary to operate in Poland. Property has been secured at Oswiccim, Cracow, for new plant to cost more than $250,000. Later division will be established for production of electrical equipment. New company will operate with capital of 2,000,000 zlotys.

General Motors China, Ltd., has been formed by officials of General Motors Corporation, Detroit, with capital of $200,000, to take over properties in China, heretofore conducted by another subsubsidiary, General Motors Japan, Ltd. Headquarters of new organization will be established at Shanghai, where expansion in assembling and service plants will be carried out later.

Gramophone Co., London, England, manufacturer of talking machines and parts, radio equipment, etc., will increase capital to £3,340,000, and will dispose of stock issue of 1,620,000 shares, considerable part of proceeds to be used for expansion in production and distribution. Company is controlled by Victor Talking Machine Co., Camden, N. J., and Radio Corporation of America, New York.

Plans are being considered by Spicer Mfg. Corporation, Toledo, Ohio, manufacturer of axles, universal joints and other automobile equipment, for a branch plant in France, to cost more than $250,000 with machinery. Charles A. Dana, president, has left for a trip abroad to secure site and complete details. Company is now operating a plant at Birmingham, England.

Swedish Ball Bearing Co. (Aktiebolaget Svenska Kullagerfabriken), Stockholm, Sweden, manufacturer of ball and roller bearings, etc., has arranged for a stock issue of 240,000 shares, of which 50,000 shares, totaling $3,433,000, will be sold in United States, proceeds to be used for expansion, including acquisition of other properties. Plants are operated in Sweden, Great Britain, France, Russia, Germany and United States, latter being known as S. K. F. Industries, with headquarters at 40 East Thirty-fourth Street, New York, and main plant at Hartford, Conn., operated under name of Skayef Ball Bearing Co. B. G. Prytz is managing director.

Petroleum Refineries, Ltd., London, England, recently formed with capital of £500,000 by Sir Arthur Grey Hazlerigg and associates, has plans for new plant at Killingholme, Lincolnshire, where property has been acquired, for production of refined oils. Division will be operated for manufacture of motor fuel oil under low temperature carbonization process. Entire project is reported to cost more than $600,000 with equipment.

New Trade Publications

Electric Welded Gas Line Pipe.—A. O. Smith Corporation, Milwaukee, Bulletin No. 505 gives impressive photographs of plant for making 26 miles of pipe daily, in any size from 8⅝ in. to 26 in., in uniform lengths of 30 or 40 ft. Tests for soundness and accuracy of size are described. A new feature is a corrugated expansion joint, also useful for short-radius bends.

Gears and Pinions.—Westinghouse Electric & Mfg. Co., East Pittsburgh. Booklet c-1579-F, describes Micarta gear material. Sections are devoted to design, application and distinctive features of gears. Data necessary to engineers for applying these gears to all classes of work are presented, with drawings and other illustrations.

Centrifugal Air Compressor.—Allen Air Appliance Co., 452 Lexington Avenue, New York. Bulletin A-50 of 12 pages illustrates and describes a line of centrifugal air compressors, with auxiliary equipment in the shape of vacuum cleaners for factory use, and other devices. These range from 50 to 150 hp. capacity in the stationary types and from 1½ to 10 hp. in the heavy-duty portable types.

Barometer and Vacuum Recorder.—Uehling Instrument Co., Paterson, N. J. Bulletin 150 of six pages illustrates and describes a combined barometer and vacuum recorder designed particularly for use in connection with steam turbines.

Quality of Heat Treating Improved

Increased Production in Same Floor Area and Reduction in Labor Costs Also Result from Electrification of Heat-Treating Department

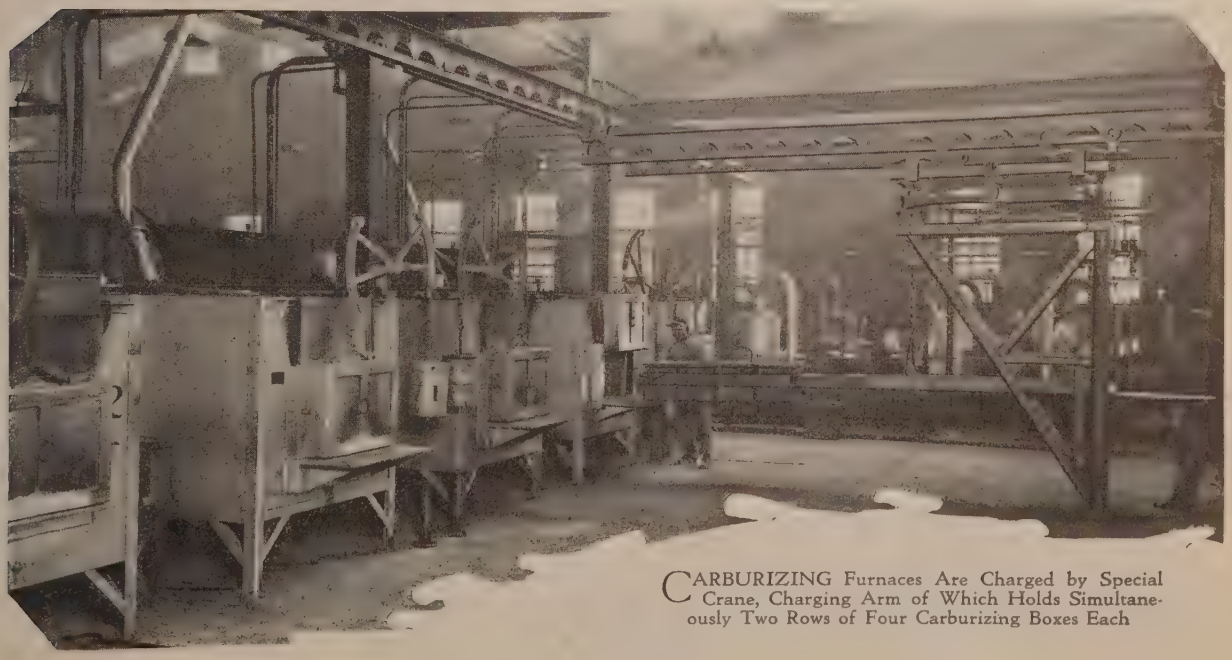
IMPROVEMENT in the quality of work, increased production in the same floor area formerly occupied, and elimination of a large amount of hand labor are major benefits derived from electrification of the heat-treating department of the National Cash Register Co., Dayton, Ohio, in which 6,000,000 cash register parts are heat treated each month. Conservation of manufacturing space has been accomplished by the installation of mechanical handling devices, an automatic transportation system now forming an integral part of the plan whereby material in process moves progressively through the department without any backtracking.

For carburizing purposes the department is equipped with five electric carburizing furnaces. Immediately behind them is a metal table on which carburizing boxes are loaded by hand. Connecting at right angles with the metal table and running alongside each furnace is a roller conveyor which carries filled boxes to a position near the front of the furnace. Here the boxes are picked up by a special charging crane, the charging arm of which holds simultaneously two rows of four boxes each. The arm then swings around and reaches into any of the five furnaces, depositing the eight boxes.

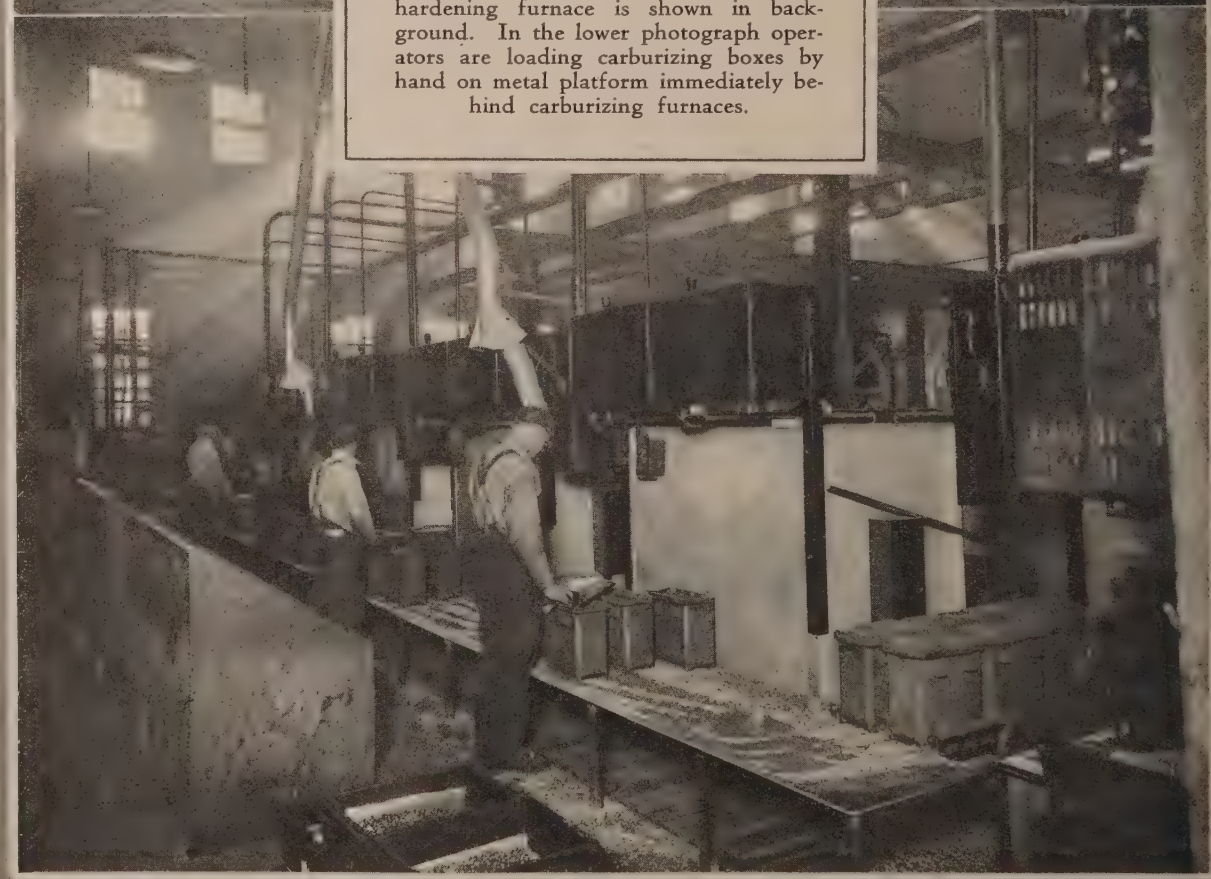
The time required for carburizing ranges from 3 to 7 hr. and the temperature varies from 1500 to 1650 deg. Fahr., both the time and the temperature depending upon the type of material being treated. Carburizing boxes are 12 in. long, 6 in. wide and 12 in. deep, and are of larger capacity than formerly. However, the change in size has been accomplished by increasing the height without altering the thickness of the box; otherwise, the temperature of the furnace would have to be increased to bring about the desired results.

Carburizing Furnaces Are on 24-hr. Schedule

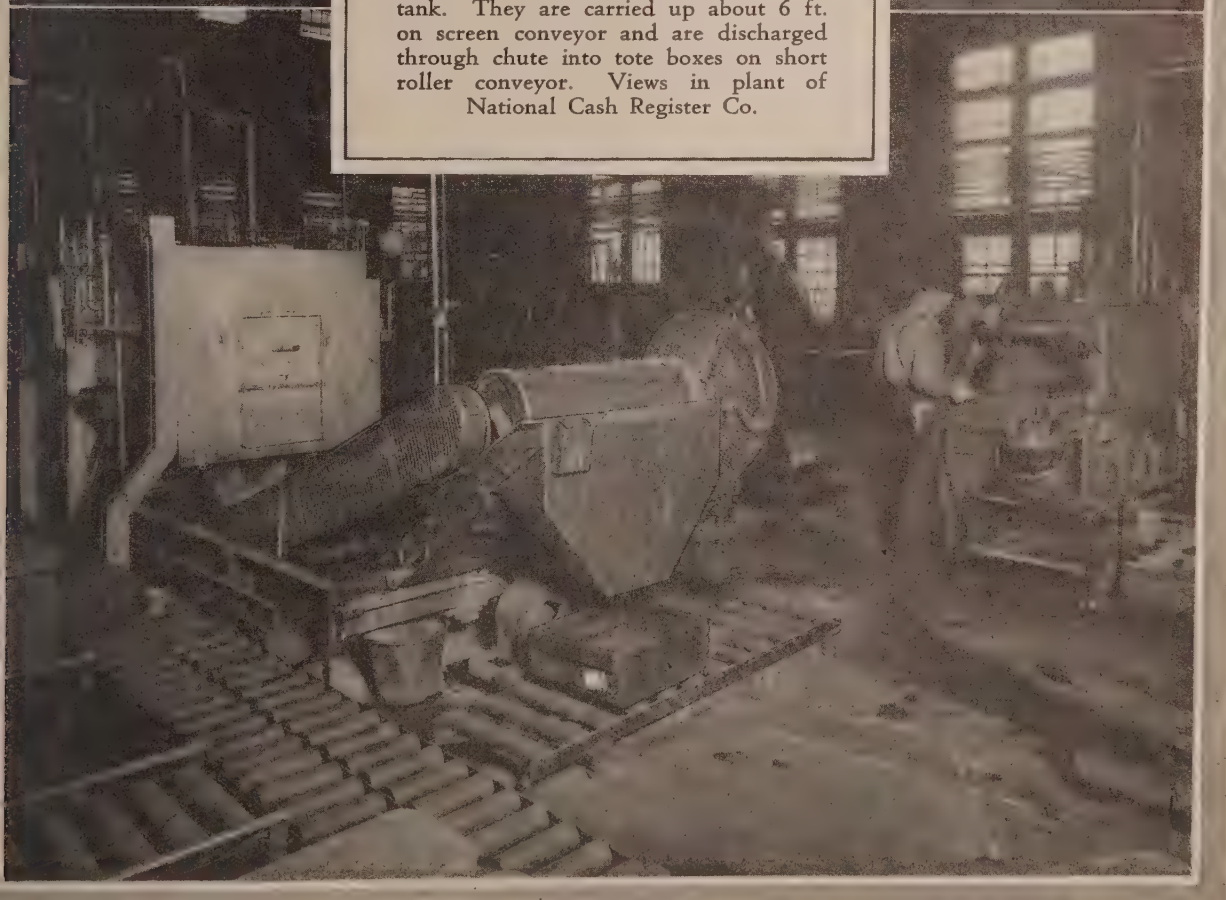
Carburizing furnaces are on a 24-hr. schedule, starting Monday morning and ending Saturday noon. The continuous operation provides a steady electrical power



CARBURIZING Furnaces Are Charged by Special Crane, Charging Arm of Which Holds Simultaneously Two Rows of Four Carburizing Boxes Each



IN the heat-treating department of the National Cash Register Co., Dayton, Ohio, carburizing boxes, after being removed from furnaces, are placed on cooling rolls (above). Continuous hardening furnace is shown in background. In the lower photograph operators are loading carburizing boxes by hand on metal platform immediately behind carburizing furnaces.

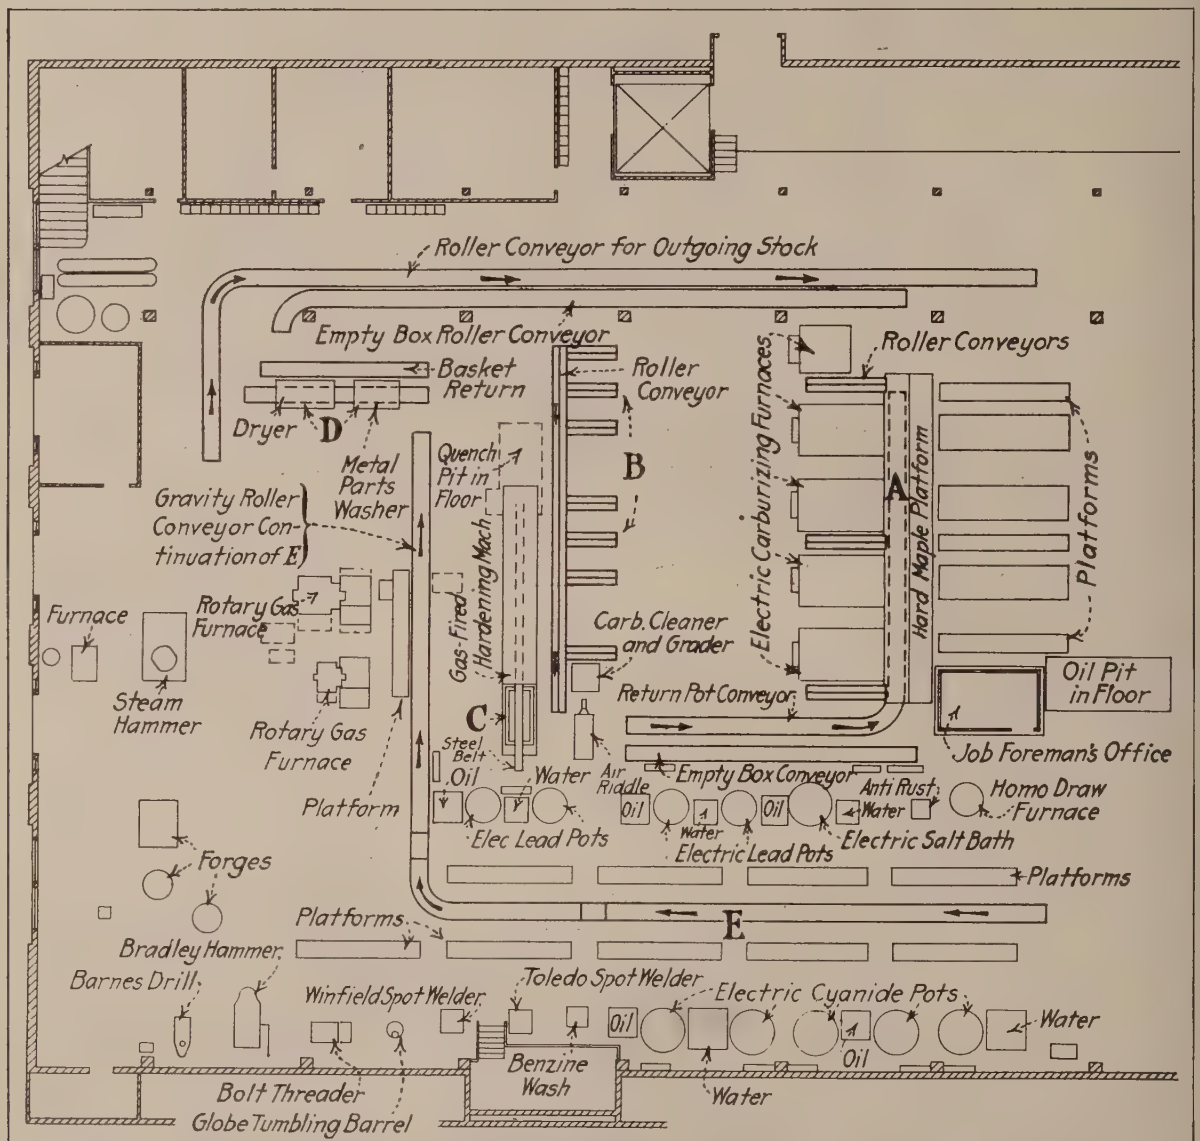


GRAVITY roller conveyor serves operators along line of lead pots and line of cyanide pots (above). At discharge end of hardening furnace (below), parts fall through chute into quenching tank. They are carried up about 6 ft. on screen conveyor and are discharged through chute into tote boxes on short roller conveyor. Views in plant of National Cash Register Co.

load and eliminates the necessity for cooling the furnaces at comparatively short intervals, thus adding substantially to the operating efficiency and to the output of the department.

At a distance of about 15 ft. from the front of the furnaces are unloading and cooling rolls, each roll having

When the boxes have cooled sufficiently, they are moved on a roller conveyor to the loading platform of a continuous hardening furnace, where the cash register parts are removed. The boxes, still on the roller conveyor, are returned to storage underneath the metal loading table behind the carburizing furnaces. The cash



PARTS to Be Heat Treated Are Loaded in Carburizing Boxes (A) and Are Moved to Front Side of Carburizing Furnaces on Roller Conveyors, Where They Are Picked Up by Charging Crane and Placed in Furnaces. After being heat treated, they are removed from furnaces by charging crane and are deposited on cooling rolls (B).

When sufficiently cooled, they go on roller conveyor to loading platform of continuous hardening furnace (C), where parts are removed and are fed by hand on to metal belt of continuous hardening furnace. Parts pass through furnace and thence through metal washing machine and drying oven (D), from which they are discharged into tote boxes.

After passing inspection, parts are transported on roller conveyor to storage position ready to go out of department.

For certain kinds of work, lead pots and cyanide pots are used. They are arranged so that gravity conveyor (E) runs between line of lead pots and line of cyanide pots, serving both.

a capacity of eight carburizing boxes. The charging crane removes the boxes from the furnaces in the same manner in which they were charged and deposits them on the cooling rolls, where they remain until they are cool enough to be handled by hand. Incidentally, each roll consists of two parallel roller conveyors 16 in. wide and placed 1½ ft. above the floor.

register parts are fed on to the metal belt of the continuous hardening furnace by a workman at the loading end of the furnace. At the discharge end the heat-treated parts fall through an air-tight chute into a quenching solution which fills a quenching tank built in the floor. The parts drop on to a metal screen conveyor which carries them upward about 6 ft., where they are discharged

through a chute into tote boxes resting on a short roller conveyor.

From this point the parts go through a washing machine for cleaning metals and thence through a drying oven from which they are discharged into tote boxes. When filled, the tote boxes are put on a roller conveyor, are carefully inspected and are transported to a storage position, where they are ready to be taken to the next department in the process of manufacture.

In connection with the continuous hardening furnace, the most difficult problem is timing the movement of the steel conveyor belt so that each different kind of part is properly hardened. Since there are thousands of various parts constantly passing through the department, close watch over the movement of the belt must be kept so as to assure readjustment of speed whenever necessary. The time required for passage of parts through the furnace ranges from 5 min. to 20 min., depending on the size of the part. The average temperature in the furnace is 1400 deg. Fahr.

For certain kinds of work lead pots and cyanide pots are used. They are so arranged that a gravity conveyor runs between a line of lead pots and a line of cyanide pots, serving both. Parts, contained in tote boxes, move down this conveyor which, at the end of the line of pots, turns at right angles and leads to the metal cleaning machine.

On certain cash register parts localized carburizing and hardening is necessary. In such cases special acetylene carburizing and hardening machines are used for spot hardening.

Furnaces in the heat-treating department are under close pyrometer control. The pyrometers are located in a special balcony room at the east end of the department and are controlled by an operator who is employed by and is under the supervision of the research department. Each tote box of cash register parts coming to the heat-treating department is accompanied by a stock card, which is delivered to the pyrometer room. The furnace loads are made up and specifications are assigned by the operator in charge of the pyrometer room.

In case a new part is to be heat treated, the pyrometer operator sends the stock card and a sample of the part to the research department, which prepares specifications for heat treatment and writes them on a special card for new parts. These cards are filed in the research department, in the pyrometer room, and in the heat-treating department according to the name and page number of the part.

WHEN Furnace Load is Made Up, Facts Are Entered on Card (right center) Which is Kept Up Two Months. Then information is transferred to another file to be held for two years. For each run of furnaces, work sheet (lower left) is filled out by operator of pyrometer room, who sends copy to heat-treating department

When the operator of the pyrometer room receives stock cards of parts to be heat treated, he checks the specifications against the specifications for the same part contained in his files. This check serves as a guard against error.

When a load for a furnace is made up, facts are entered on a card which is called a "record of parts heat treated." Information includes the furnace number, specification, platform and truck number, order number, amount, identification of the packer and furnace man, the time the heat commenced and finished and the total time of heat treatment. This record is kept for two months, after which it is transferred to another file to be held for two years.

For each run of the furnaces a work sheet is made out by the operator of the pyrometer room, who sends a copy to the heat-treating department.

A yearly record of the operation of each furnace is filed for reference purposes on small cards giving the date and the number of parts heat treated. All pyrometer records are kept for two years so that facts regarding heat treatment of any part is at hand in case any question arises.

Trouble Shooting With Microscopes

Characteristic Microstructure Indicates Cause and Remedy for Many Common Troubles in Steel, Iron or Malleable Foundry

BY E. K. SMITH AND F. B. RIGGAN*

MANY foundrymen think the microscope is a tool for use only in the research department. From several years' experience, we have found it to be useful for the investigation and prevention of defects in castings and other metal products. When "trouble shooting," the microscope not only magnifies the foundryman's eyesight 100 to 1000 times, but also enables him to have a permanent record for future reference in the photomicrograph.

We will attempt to give some illustrative examples in this specialized use of the microscope for the location, investigation, and prevention of troubles often arising in the foundry. (Unless otherwise noted, the magnification is 100 diameters, reduced one-ninth.) The cost of the equipment is not excessive—usable microscopes cost as low as $250. Examination of a specimen may be made in one-half hour, and photographs can be completed in less than two hours. Supplementing chemical analysis, and as an aid in the maintenance of quality, we have found that the microscope has earned a place for itself in modern industry.

Figures 1 and 2 show a steel casting before and after the anneal. The coarse white grains of ferrite in the steel, as cast, form planes of weakness, hence unannealed steel castings are brittle. These large grains are broken up in the anneal, as shown in Fig. 2, producing a tough metal. The thoroughness of the annealing operation on carbon steel can be readily judged by the grain size.

One of the difficult problems in the manufacture of steel castings is to remove all the slag, or inclusions,

*Metallurgist and associate metallurgist, respectively, Stockham Pipe & Fittings Co., Birmingham.

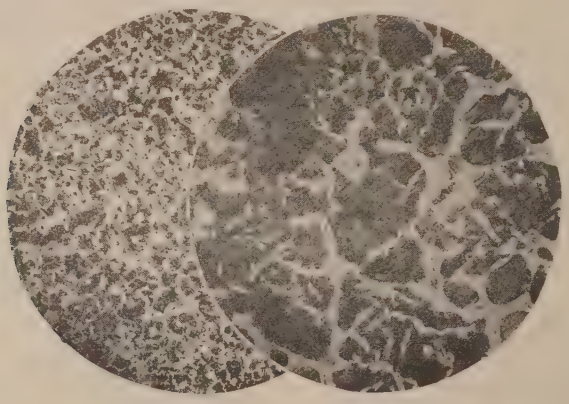

FIG. 1

FIG. 3

FIG. 2

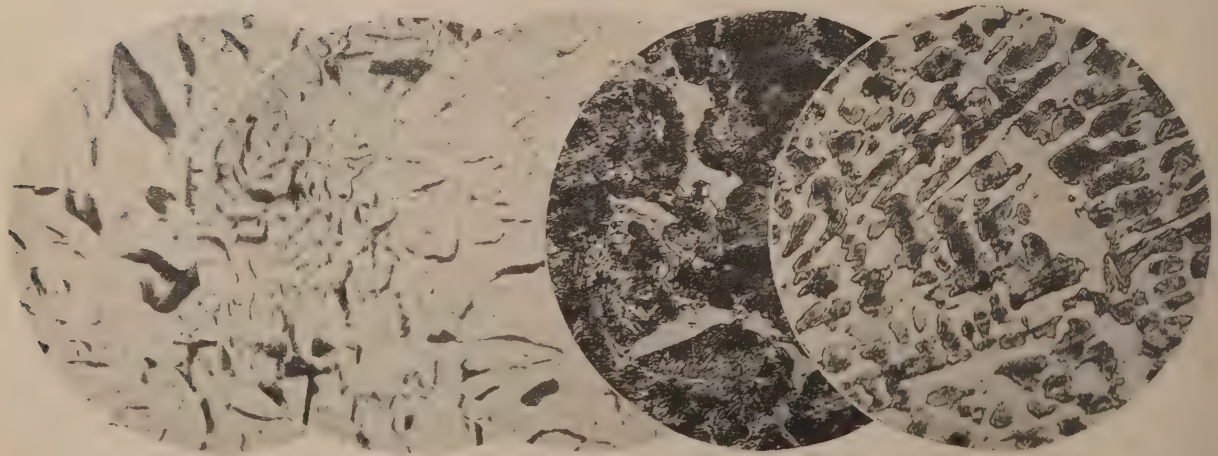

FIG. 4 FIG. 5 FIG. 6 FIG. 7 FIG. 8

incidental to the melting and refining processes. Examination of a polished sample, unetched will show such inclusions. Fig. 3 is an unrefined steel, containing large slag inclusions, indicating a very inferior metal. A clean electric steel would present an almost unblemished mirror, having only a light sprinkling of very small specks of non-metallics.

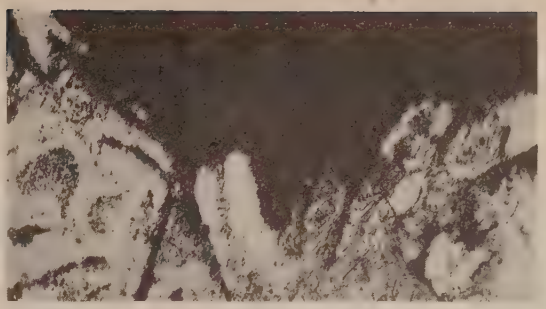
Micros 4 to 8 show cast irons of various degrees of machinability. Figures 4, 5, and 6 are unetched. The first of these is a gray iron with large flakes of graphite, which naturally causes planes of weakness. This iron is suitable only where ease of machining is more important than strength. The strength could be increased by lowering the carbon or silicon content, thus obtaining a finer grained graphite. Figure 5 shows such an iron combining machinability with great strength. Figure 6 illustrates an iron with still smaller graphite, due to a greater amount of carbon in the combined form. Combined carbon appears in mottled areas in the etched sample of the same iron, Fig. 7. This shows white patches of hard cementite (iron carbide) surrounded by striped or mottled areas of pearlite (small plates of iron carbide mixed with small crystals of pure iron). This casting could not be machined at high speed, unless annealed, because of the larger cementite masses caused by too quick cooling, or by excessively low silicon or carbon. Figure 8 is a very hard iron, almost unmachinable. The large areas of white are cementite, which is very hard and brittle.

Discovering Leaky Gray Iron Castings

Some types of gray iron are subjected to high pressures and it is difficult to prevent leaks in the older kinds of very soft gray iron. Leakage, as a rule, is due to two things: porous grain and shrinkage cavities. Figure 9 (X 500, reduced one-half) shows a weak, porous, gray iron, after etching. The black space is a drilled hole. The jagged part is where the drill has torn out a large plate of graphite. The microscope clearly shows why such a structure would not hold pressure, although, to the naked eye, the iron seems to have a close grain.

A view of a shrinkage cavity, X 1000, reduced one-half, (etched sample) is given in Fig. 10. Besides leaking under pressure, "shrinks" cause trouble in machining, due to the very hard edge shown as a white area around the black hole in the micrograph. The remedy is to feed the metal continuously while pouring so as to fill the cavities, to use metal which shrinks less, or, as a last resort, to change the design of the part.

The microscope has found an immediate place in the malleable foundry, since it is so well adapted for locating



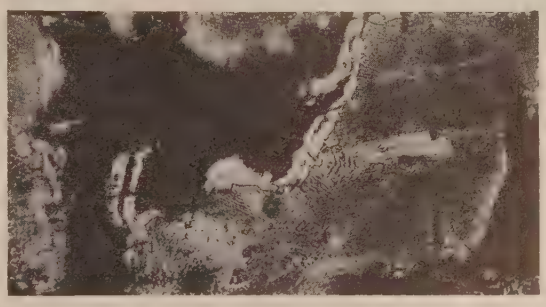


FIG. 9 (TOP) FIG. 10 (LOWER)

trouble in the anneal. Any difficulty due to composition can be located easily by chemical analysis; however, this tells us comparatively little about the heat treatment of a defective casting. Figure 11 shows the white iron, before the anneal (etched). The material is very hard and brittle, the structure being in a characteristic tree-like form called dendrites. If this hard iron had had even a very light anneal, some black spots of temper carbon would be seen, as in Fig. 12 (a partly annealed malleable). Spots of black temper carbon are surrounded by light rings of practically carbon-free iron (ferrite), but the general gray background shows that graphitization is not nearly complete. Figure 13 illustrates the structure of completely annealed malleable. The black spots are temper carbon, the light grains are ferrite.

Sometimes there is difficulty in machining malleable castings. If the microscope shows a "bull's-eye" structure, as in Fig. 12, the anneal was not sufficient for the composition of the metal. Sometimes the trouble is due to a hard edge, as shown in Fig. 14. This is usually traceable either to annealing conditions, or to faulty analysis.

New Wright Aeronautical Engines

Three Units Have Many Parts Interchangeable— Manufacturing and Storing Problems Are Simplified

BY FAY LEONE FAUROTE

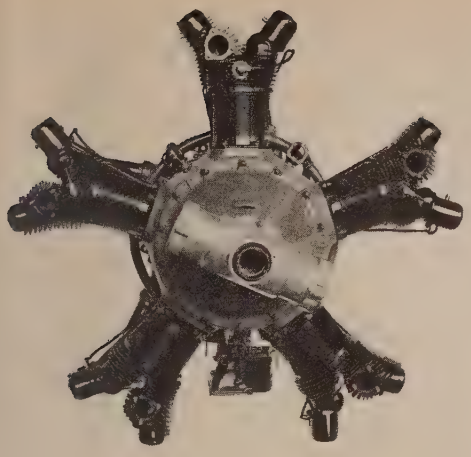
DURING the early part of 1928 there appeared in these pages a description of the Wright Whirlwind aeronautical engine, and its method of fabrication and assembly.* The property of the Wright Aeronautical Corporation then consisted of some seven acres of land. Manufacture was being carried on in a plant, part of which was rented, having an area of 125,000 sq. ft. There were some 1100 employees. The fixed assets amounted to about $2,100,000. The public's acceptance of flying as a safe means of transportation and the rapid growth of the aviation industry have, however, combined to produce an increase in aeronautical engine manufacture which hardly seemed possible a year ago.

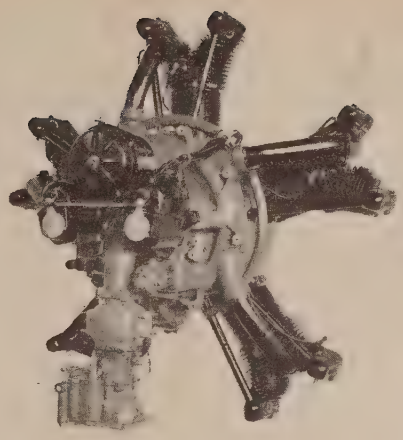
At present there are more than 2600 employees on the company's payrolls; the corporation owns some 28 acres of land adjacent to the main line of the Erie Railroad in Paterson, N. J.; has over 600,000 sq. ft. of manufacturing and testing space; an enlarged plant equipped with modern machinery, much of it of special design, capable of producing 500 engines a month on one shift. The gross investment in fixed assets at the end of February, 1929, according to information given me by James P. Prince, treasurer, exceeded $7,600,000. The profit for the year

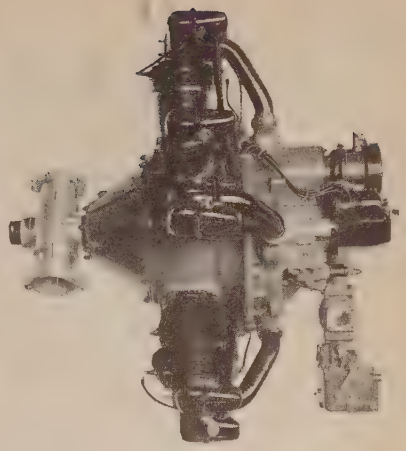
*See THE IRON AGE, Feb. 9, 1928, page 394; March 1, page 590; March 29, page 867. The present is the first installment in a series of articles dealing with the manufacture of the new Wright engines for aircraft.

AT Top of Page Are, Left to Right, the Gipsy 90-Hp. Engine of Four Cylinders, Side and End Views and a Three-Fourths Front View of the Five-Cylinder 165-Hp. Whirlwind Engine, with Exhaust Collector Ring and Nose Cowl in Place

At Bottom of Page Are, Left to Right, a Three-Fourths Front View of the Seven-Cylinder 225-Hp. Whirlwind Engine and Front and Side Views of the Nine-Cylinder 300-Hp. Unit







ended Dec. 31, 1928, amounted, after deduction of Federal taxes, to $2,433,771. Fifteen hundred and ten engines of the 225-hp. Whirlwind type constituted the bulk of the year's business. The company's sales in 1928 amounted to $8,781,516. This represented delivery of 1644 engines of various types, together with spare parts. Of these, 766 engines were sold to the United States Government, the remaining 878 to commercial manufacturers.

Following as a natural result of growth in aeronautical transportation, there has been a demand for a wider range of engine power. The Wright company has accordingly designed a new line of Whirlwind engines in five-, seven- and nine-cylinder sizes, developing 165, 225 and 300 hp. respectively. These new power plants are lighter than the earlier ones and contain several refinements and improvements in design which will make their description and method of fabrication of interest to all the readers of THE IRON AGE.

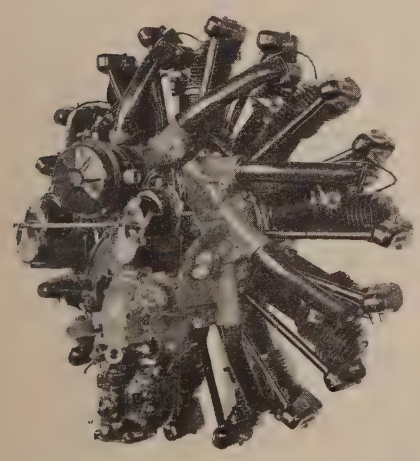
Of paramount importance is the fact that in these three new models there is a very complete interchangeability of parts, wherever possible. Furthermore, their manufacture, as now being carried on in the new Wright plant, is the first good example of the application of mass production methods to very close limits that I have seen in the airplane engine field. The new engines are now going into quantity production and about 25 a day are coming through. The ratio of production of the three types at present is 400 of the nine-cylinder 300 hp. (Model R-975), 50 of the seven-cylinder 225 hp. (Model R-760), and 50 of the five-cylinder 165 hp. unit (Model R-540).

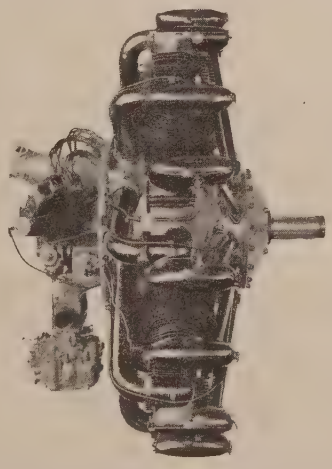
In addition to this, the engineers have developed in the experimental department an inverted V-type, 500-hp. air-cooled engine which promises much. According to Charles L. Lawrance, president of the company, this engine has successfully passed its 50-hr. official test, and an experimental contract for 14 of these engines has been placed by the United States Government. Mr. Lawrance says further that this type of engine will, it is believed, in a measure supersede the large radial air-cooled engines for heavy transport service, due to its greatly reduced head resistance for equivalent horsepower. While this engine has not been flight-tested, and no adequate performance data are yet available, it is said that the representatives of the Government have confidence in it as a type for observation and bombing planes.

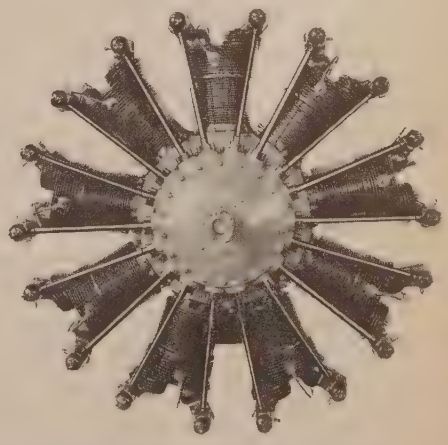
Arrangements have also been made with the de Haviland Aircraft Co., London, England, for the manufacturing and selling rights in the United States of the 90 to 100-hp. four-cylinder air-cooled Gipsy engine. It is expected that this engine will go into production during the summer. The Wright line of aeronautical engines will then comprise five models ranging from 100 to 525 hp.

Development of the Lawrance Engine

As early as 1914 Charles L. Lawrance attempted to demonstrate the value of the air-cooled aeronautical engine, building two-cylinder and three-cylinder types on

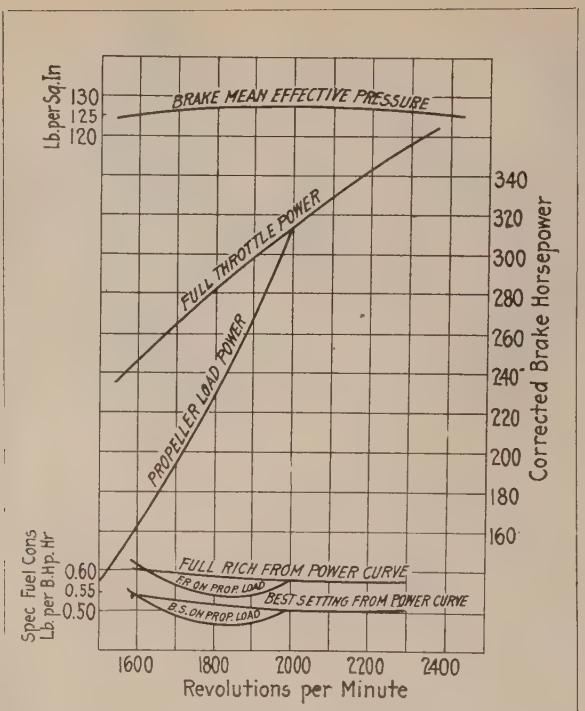






AT Top of Page Are, Left to Right, Front, Three-Fourths Rear and Side Views of the Five-Cylinder 165-Hp. Whirlwind Engine. Exhaust collector rings and nose cowls are not in place, but two views show the propeller hub

At Bottom of Page Are, Left to Right, a Rear View of the Nine-Cylinder 300-Hp. Whirlwind Engine and Side and Front Views of the Still Larger Cyclone Engine, Also with Nine Cylinders, but Developing 525 Hp.



WRIGHT Whirlwind Model R-975, 9-Cylinder Aircraft Engine, Power Curves at Full Throttle and on Propeller Load; Fuel Consumption at Full Rich and Best Setting; Compression Ratio 5.1 to 1, Using Aviation Gasoline

an experimental scale. Unfortunately, he was unable to bring his ideas to fruition during the World War, but both the English engineers and the American aviation authorities, realizing the value of the light weight and the simplicity of the air-cooled type, became interested. In 1923, through a merger effected between the Lawrance Aero Engine Corporation and the Wright company, all rights to the manufacture and sale of the Lawrance air-cooled engines were obtained; and finally, after a successful test, the Army gave the Wright company an order for a 350-hp. engine which was known in the shop as Model R-1. This was successfully designed, built and tested and was the first air-cooled radial engine to be operated successfully in the United States.

Later, Army and Navy orders for 150 and 200-hp. nine-cylinder air-cooled types came through. The smaller one was abandoned and the larger developed through stages into the Model J-1, an ancestor of the famous Whirlwind. Models J-3 and J-4, containing refinements and improvements, followed, the latter becoming a favorite with both the Navy and commercial manufacturers for planes requiring 200-hp. Finally the J-5 came into being, and this model was used by Lindbergh, Byrd, Chamberlain and others who successfully completed the amazing trans-oceanic and trans-continental flights during 1926, 1927 and 1928.

The new series which will replace the Wright J-5's will be known as the J-6 series and will retain the name "Whirlwind"; while the large type, developing 525-hp., has been christened, in accordance with the Wright practice of naming their engines after the winds, "Cyclone."

Three New Wright Whirlwinds

BELIEVING that it would be a great advantage if most of the major parts could be standardized and made interchangeable, the three new Wright Whirlwinds, having five, seven and nine cylinders respectively, have been built as radial engines with standard stationary cylinders and rotating crankshafts. They operate on the familiar four-stroke cycle principle, but contrary to the usual practice in automotive power plants there is only one crank throw for the entire set of pistons, instead of a separate throw for each piston. The connecting rod from the piston in the vertical cylinder is the only connecting rod attached directly to the crankshaft. This is known as the "master rod." The other connecting rods are, in turn, attached to the big end of the master rod by a linked pin, all connecting rods and pistons thus working together as the crankshaft revolves.

The crankshaft is of a single-throw two-piece type, made from an alloy-steel forging and counterbalanced to prevent vibration. It is drilled for oil passages, giving positive-pressure lubrication to the bearing surfaces. All the bearings are of ample size and generously lubricated. The connecting rods are of a forged alloy steel and consist of the one-piece master rod and the articulated rods, one for each cylinder. The wrist-pin and knuckle-pin bushings are of bronze, pressed into the articulated rods. The crankpin bearing is of anti-friction metal, steel backed, pressed and doweled into the big end of the master rod.

By a unique design it is possible in these models to do away with the two-piece master rod with its cap, formerly used in Wright Whirlwind engines, and to use in its place a one-piece rod cut out of a solid forging, which when the crankshaft is disassembled may be slid on from the open end of the crank.

Aluminum-Alloy Pistons Used

The pistons are made of aluminum-alloy, cross-ribbed on the under side of the head, and fitted with full-floating hollow pins held in place by expanding spring wire locks, so that the ends of the pins are prevented from destroying the cylinder walls. The piston pins and cylinder walls are lubricated by oil spray from the crank and knuckle-pin bearings. The upper external surface of the piston head is slightly concave, which in conjunction with the internal shape of the cylinder head results in an almost ideal spherical combustion chamber.

The whole valve mechanism, including push-rods, is completely inclosed as a protection against dust, salt-spray and the like, the rocker shafts being mounted in a housing cast integrally with the cylinder head. Hardened steel cam followers operate through hardened steel rollers running on the cam ring. The push-rods are of hollow steel tubing fitted with case-hardened steel ball ends. These actuate the forged steel rocker arms. The rocker arms are carried on ball bearings lubricated by an Alemite or a Zerk pressure system and have provisions for adjustments necessary for correct valve clearances.

Equipped with air-cooling fins carefully machined out of a solid steel barrel, the cylinders are attached to the crankcase by eight steel studs passing through the cylinder flange. The aluminum alloy head is screwed and shrunk on to the combustion end of the cylinder. The intake ports are at the rear of the cylinders, while the exhaust ports are placed on the forward side, to obtain the most effective cooling.

Crankcase Assembly of Four Castings

Four major castings of aluminum alloy make up the crankcase assembly. The cam follower ring, carrying the tappet guides, is cast integral with the main section of the crankcase, giving rigid and accurate support and perfect lubrication to the shafts, and resulting in a considerable saving in weight and in the elimination of a number of detailed parts. The rear section carries all accessory drives, such as those for magnetos, oil and fuel pumps, generator and rotary induction system. Pro-

vision is made also for the easy installation of a suitable generator and starter. The whole crankcase unit is strong, compact and light in weight.

All accessories on the engine are at the rear, including the valve-operating push-rods. By this arrangement the head resistance of the engine while in flight is reduced and simple, effective cowling design is possible. Accessories such as the magneto, etc., are protected also. Each engine is provided with a front exhaust manifold of the collector-ring type and with a nose cowling with shutters operated from the pilot's seat. These movable shutters permit the flow of air around the crankcase and cylinders to be regulated so as to give the maximum engine efficiency under varying climatic conditions and atmospheric temperatures.

Provision for Lubrication

Lubrication is provided by a pressure pump which carries the oil to the front or rear of the hollow crankshaft, from which point it is distributed to the various bearings of the equipment. The excess oil from all parts of the engine drains into a sump located in the main crankshaft casting, between the bottom cylinders. From this sump a single-suction pump delivers the oil to the main oil tank in the airplane, passing it through a strainer installed at a convenient point outside the engine. This strainer removes any foreign material that may have found its way into the lubricating system. The oil pressure is automatically regulated by an adjustable valve. The lubrication system has been carefully designed so as to eliminate all external oil pipes. Experience has shown that external oil pipes are liable to leakage and they have proved to be unsatisfactory in service, due to the excessive cooling of the oil in cold weather. By this new design troubles arising from these sources have been ended.

Magnetos and Carbureter Are in Rear

Two Scintilla magnetos, mounted behind the engine and operating independently, provide the ignition through two separate spark plugs in each cylinder. While both of these magnetos are normally in simultaneous use, the engine will operate in an emergency on one magneto, with a slight loss of speed.

A specially designed Stromberg carbureter of the single-barrel type, mounted on the rear section of the crankcase, supplies the fuel mixture. Passing through the carbureter into the diffuser chamber of the crankcase, the mixture is evenly distributed through all cylinders by a unique rotary impeller mounted in this diffuser chamber. This system of positive control of the distribution of the mixture produces a smoothly running engine and is of special value in the smaller types, eliminating the vibration caused by unequal distribution of the combustible mixture. A "hot spot" which thoroughly vaporizes the fuel mixture is provided above the carbureter. The temperature may be regulated by the pilot so that maximum efficiency and fuel economy may be obtained under all kinds of conditions.

The same type and diameter of mounting ring is used for all three of the new Wright Whirlwinds. All controls are placed at the rear of the engine, thus simplifying the installation.

Aside from the crankcase and other connective parts which are manifestly not interchangeable between the three models, all of the other parts, such as the cylinder, cylinder heads, valves, rocker arms, push-rods, pistons, piston pins and the like, are wholly interchangeable. This is proving to be a great advantage and will simplify greatly the maintenance and service problems, both on the field and in the shop.

Each engine is shipped complete with the following items: carbureter, air heater and cleaner, nose cowling, exhaust manifold, ignition switch, priming pump, tool kit, instruction book and domestic shipping box.

Engine Specifications

Type—Air cooled, four cycle, fixed radial			
Model No.	R-540	R-760	R-975
Number of cylinders	5	7	9
Bore	5 in.	5 in.	5 in.
Stroke	5½ in.	5½ in.	5½ in.
Displacement	540 cu. in.	756 cu. in.	975 cu. in.
Compression ratio	5.1:1	5.1:1	5.1:1
Guaranteed horsepower (sea level) at 2000 r.p.m.	165	225	300
Fuel consumption (maximum), per hphr.	0.55 lb.	0.55 lb.	0.55 lb.
Oil consumption (maximum), per hphr.	0.035 lb.	0.035 lb.	0.035 lb.
Length overall (no starter)	40⅝ in.	40$\frac{23}{32}$ in.	41$\frac{7}{16}$ in.
Mounting flange to propeller hub	28$\frac{23}{32}$ in.	28$\frac{23}{32}$ in.	28$\frac{23}{32}$ in.
Diameter overall	45 in.	45 in.	45 in.
WEIGHTS, EQUIPMENT AND ACCESSORIES			
Engine (including hot-spot)	370 lb.	425 lb.	520 lb.
Air cleaner and heater	6 lb.	6 lb.	6 lb.
Exhaust pipes and collector ring	20 lb.	23 lb.	27 lb.
Nose cowling	6 lb.	6 lb.	6 lb.
Total weight to standard specification	402 lb.	460 lb.	559 lb.
Shipping weight (including box)	825 lb.	880 lb.	980 lb.
Size of shipping box	85 cu. ft.	85 cu. ft.	85 cu. ft.

Extra accessories for all models, not included in the table, include Eclipse hand inertia starter, weighing 21 lb. approximately; Eclipse generator, 15-volt, 15-amp., 16 lb.; Eclipse generater control box, 2½ lb.; Fuel pump (Wright C-3 modified), 2 lb.; Standard steel propeller hub, 23 lb.

Relation of Power to R.P.M. and Fuel Used

Power curve diagrams, one of which is here reproduced, indicate the power output and fuel consumption of the engines at various speeds. The "Full Throttle Power" curve shows the average maximum power output at the engine speeds. The "Propeller Load" curve is based on the rated speed of each type of engine, showing the power output obtained at a given engine speed with the engine fitted with a propeller which will permit the engine to reach rated r.p.m. at full throttle. For example, the rated speed of the "Whirlwind Nine" is 2000 r.p.m.; reference to the "Propeller Load" curve for this engine shows a power output of 325 hp. at this speed; at 1800 r.p.m. the output is 236 hp., and so on through the range of the curve.

If the full throttle speed is above or below 2000 r.p.m., owing to the type of propeller fitted, then the propeller load curve will start at that point on the power curve corresponding to the maximum r.p.m. and will be similar in form to the propeller load curve drawn from 2000 r.p.m.

From the fuel consumption curve of the "Whirlwind Nine" it will be seen that, at the "Full Rich" position of the carbureter mixture control, the specific fuel consumption in pounds for each brake hphr. decreases from 0.60 at 1600 r.p.m. to 0.57 at 2200 r.p.m. on the "Full Throttle Power" curve. With the mixture control adjustment utilized to increase the proportion of air to fuel in the carbureter to the maximum point at which the engine still loses no r.p.m., the fuel consumption is as indicated on the "Best Setting" curve for full throttle power. The fuel burned ranges from 0.53 lb. to the brake hphr. at 1600 r.p.m. to 0.50 lb. at 2200 r.p.m.

These two curves show also how the fuel consumption

Main Plant of the Wright Aeronautical Corporation in Paterson, N. J.

can be varied at any fixed r.p.m. by using the mixture control. For example, at 1800 r.p.m. the fuel used varies from 0.518 lb. to 0.586 lb., according to the setting of the mixture control. The "Propeller Load" fuel curves indicate a similar variation of fuel consumption, corresponding to changes in r.p.m. and the position of the mixture control valve on the carbureter.

The upper "Propeller Load" fuel curve shows the fuel burned at various r.p.m. with a "full rich" mixture; the lower "Propeller Load" fuel curve demonstrates clearly the result of using the mixture control.

It should be noted that considerably lower fuel consumption than that indicated on the curves can be obtained in actual flight by intelligent use of the mixture control. The method of procedure is to set the mixture control at the "full rich" position and the throttle control at the point where the engine speed is from 25 to 30 r.p.m. above that required; the mixture control is then opened out to give the carbureter additional air until the engine r.p.m. have decreased to the required speed. The engine is then operating on the most economical mixture consistent with smooth running.

If it is desired to plot a fuel consumption curve for a propeller which allows a maximum engine speed above or below 2000 r.p.m., then the maximum r.p.m. of the required fuel consumption curve must correspond to the full throttle r.p.m. of the propeller load curve. The fuel consumption curve can then be plotted to follow in form the propeller load fuel curve on the diagram shown.

To convert the specific fuel consumption into gallons an hour, the specific consumption in pounds to the hphr. is multiplied by the horsepower output of the engine, the product being divided by the weight in pounds of a gallon of the fuel used. The resultant is the consumption in gallons an hour. The average weight of a gallon of aviation gasoline normally obtainable is 6 lb.

Synthetic Molding Sand Preferred by Dutch Foundryman

A FOUNDRY molding sand problem was discussed by H. Van Aarst in a paper "The Problem of Foundry Molding Sand," presented at the Third International Foundrymen's Congress in London, June 11 to 14. It was presented on behalf of the Dutch Foundry Technical Association.

As a result of experiments, the author prefers synthetic molding sand, because all natural sands, both as regards grain size and the clay content, are very irregular. From the beginning of 1928 the author has prepared loam, molding sand and core sand, using only river sand, sea sand, dune sand and clay. The loam consists of fine river sand, which is mixed with undried clay, to which flax waste and fine coal are added.

Two castings, made without a pattern, were cast in this loam. One was the half of a centrifugal pump (principal dimensions: length 14 ft., width 5¼ ft., height 9 ft., diameter of delivery tube 4.6 ft., weight 19,800 lb.; time required for casting, 45 sec.). The other casting was a stern tube for a motorship, which was cast vertically (time required for casting, 3½ min.; length 21.65 ft., weight 24,200 lb.).

Molding sand for dry molds is made of fine river sand, clay, flax waste and fine coal, mixed dry. In this sand both locomotive cylinders and the heaviest type of foundation plates are cast. It is also used for lighter castings, but it is then made up of a finer grain and without flax.

For core making, sea or dune sand is almost exclusively used, but for very large cores fine river sand is prepared. The sand is dried until quite free from water. Linseed oil is mainly used as a binding material.

Technical Paper No. 442 of the Bureau of Mines is entitled "The Blast Furnace Stock Column," by S. P. Kinney, North Central Experiment Station, United States Bureau of Mines, Minneapolis, Minn. It contains 148 pages and 62 illustrations and charts. It is a report covering another step taken by the bureau in investigations of iron blast furnace operations and discusses observations made of a 700-ton furnace, the previous studies having to do with a 300-ton and a six-ton furnace. Almost every phase of the operation of such a furnace has been investigated and the results are particularly valuable.

Europe's Industrial and Political Future Pivots on Coal and Iron Ore—II.

Old Systems of Assemblage and Distribution Cut Apart by Tariffs—Great Britain's Situation Most Serious—Germany Must Get Ore from France

BY EDWIN C. ECKEL*

IT is tempting to think of European mining and metallurgy as not having been seriously or permanently changed by the war; but that point of view embodies some serious errors. It is true, of course, that a shift in national boundaries gives to one country what was formerly controlled by another—to which extent no *total* change occurs. But if we stop at that point we overlook the fact that the old established metallurgical districts of Europe had certain long-standing relations with their raw material supplies and with their markets, and that in the new Europe many of these old systems of assemblage and distribution are now cut apart by tariff boundaries. So in speaking of the individual countries we must bear in mind these trade changes along with the more obvious changes in national control of raw materials and mills.

The Decline in British Mining and Metallurgy

Fifty years ago Great Britain was still the leading producer—as she had been for a century before that—of coal, pig iron and steel, and by far the leading exporter of each of these basal products. Today we see a Socialist-Labor party come into power in Great Britain chiefly because each of these three great industries is in a very serious condition, and because neither of the two old political parties could supply intelligence enough to meet those conditions. It is questionable, indeed, if the Labor party can do that; but it can at least attempt the task with a good will which has been lacking in the past.

Now, in trying to decide whether this decline of British industry is temporary or permanent—a matter of the first importance for all of us—there are several allied or related features which must be set aside for the moment if we are to reach any clear decision. We must not, for example, confuse Great Britain with the British Empire. We must not confuse industrial decline with financial weakness. For, whatever the condition and prospects of strictly British industry, the British Empire is still by far the greatest force in the world; and British financial strength is still not seriously weakened by her home industrial disturbances. In future, unless these industrial troubles be ended, these two statements will no longer be true; for imperial power and finance would decline in the long run with any permanent decline in the British coal and iron trade.

Unlike most of the other European countries, Great Britain did not gain or lose a single ton of coal or iron reserve as the direct result of the war. As in 1913, Great Britain ranks second to Germany among European coal-reserve nations, but still with a reserve tonnage equal to that of all the other European countries combined. As in 1913, Great Britain still has enormous reserves of very low-grade iron ore, and still habitually imports most of the ore from which she makes her iron tonnage.

The difference between conditions in 1913 and in 1929 is chiefly social and not strictly material. During the war Great Britain supplied coal and iron to all her allies, in the maximum tonnages possible—and at the maximum prices that could be secured. In order to produce this tonnage under war conditions wages were raised far above pre-war levels; and the Government aided mine owners where necessary to keep production up. After the war the laborers refused to have wages reduced as export prices fell. A shorter mine day was introduced, with resultant lower output per man employed.

Meantime the trade of the world in general fell off very sharply and has not yet recovered. Countries which were formerly good customers have erected steel plants and tariff barriers simultaneously, not the least of them being British dominions and colonies. With all these weights to carry, the British coal and iron industries have been stagnant at best and depressed at worst; and unemployment has risen to chronic and alarming proportions. It is this situation which has defeated the Conservative and wrecked the Liberal parties in England. It is this situation which, unless remedied, will drive the Labor party further and further into Socialistic remedies.

The weak points of the situation are that practically all foods and raw materials have to be imported from high-cost countries; so that English living costs and wages will normally be far above French or German levels. The strong points of the situation are the location of almost all the coal fields and most of the iron works on or near the coast, the preeminence of the British merchant marine, and the existence of old trading outlets in South America and elsewhere.

France Has Greatly Increased Ore Exports

Before the war France was a heavy exporter of iron ore, because most of the output of the Briey-Longwy basin went across the border to German furnaces. Since the war, though some of these same furnaces became French in nationality, the French ore export has been heavily increased. Over half of the Normandy-Anjou output goes to either English or German furnaces now.

With regard to coal supplies, France has gained little by the war. With the exception of two mines on the French edge of the Sarre basin, returned to France by the treaties, there has been no permanent accession of coal lands. The Sarre field itself, which is to be under French operation until 1935, will probably go back to German control by a plebiscite in that year, so that its 12,000,000 tons of annual coal output cannot be looked upon as French. Recent data on actual French coal outputs for 1927 and 1928 are as below in metric tons:

Coal Field	1927	1928
Pas de Calais	24,299,220	24,042,408
Nord	8,919,400	9,223,145
Moselle	5,365,800	5,554,660
Loire	3,970,540	3,716,023
Blanzy-La Mure	3,104,820	3,020,641
Gard-Graissessac	2,235,980	2,174,330
Carmaux	2,095,300	1,994,254
Other	1,787,470	1,640,316
Total coal	51,778,530	51,365,777
Total lignite	1,067,290	1,063,691

*Mr. Eckel is spending several months in Europe in the interest of American clients, this being the fourth of his extended investigations there since the war. His close-range study of industrial conditions in Western Europe began with his engineering service in the A. E. F. as major, from July, 1917, to July, 1919. One phase of that experience was the operation of several cement mills with troop and civilian labor. He is the author of two works dealing with cement materials, also of "Coal, Iron and War."

With regard to iron ore resources, the events of the past 15 years have placed France not only first in Europe but probably first in the world. For, in addition to gaining by conquest half of the largest of the world's ore fields, another of almost or quite equal size has been developed on her own soil.

Five Billion Tons of Lorraine Ore

In terms of reserve ore tonnage we may assume that France now has in the entire Lorraine basin some 5,000,000,000 tons of ore, capable of producing some 2,000,000,000 tons of pig iron. In the Anjou-Normandy basin recent work would suggest a total ore reserve of at least 2,000,000,000 to 3,000,000,000 tons of far higher grade than the Lorraine product, and capable of yielding between 1,000,000,000 and 1,500,000,000 tons of pig metal, perhaps more.

As against all this tonnage the reserve is being drawn upon in the fashion shown below, where for convenience of historic reference the old German districts are separated from the pre-war French Lorraine regions. The official figures for 1928, recently issued, are used, supplemented by earlier data for comparison:

Iron Ore Output of Present French Districts, 1913-1928—Metric Tons

District	1913	1927	1928
Briey-Longwy-Nancy ..	19,979,937	23,872,040	26,162,582
Metz-Thionville (German)	21,136,265	19,210,980	20,404,150
Anjou-Normandy	1,212,911	2,296,340	2,497,601
Other French districts.	726,023	291,560	263,509
Total French ore output	43,055,136	45,670,920	49,327,842

It will be seen that the old German Lorraine fields have shown a slight loss since 1913; that the old French Lorraine fields have increased some 35 per cent, and that the Anjou-Normandy-Brittany field has increased some 100 per cent.

German Coal and Iron

At the opening of the World War the German Empire was currently credited with possessing close to 60 per cent of the entire European coal reserve and some 30 per cent of the total iron ore reserves. The war has reduced these percentages—the coal not too seriously, for the German total is still close to half of the European reserve; but the iron ore very sharply, so that today the German Republic holds perhaps 7 to 8 per cent of the total. The coal decrease was due to the temporary alienation of the Sarre field and to perhaps more permanent losses in Silesia. The iron ore loss was due almost entirely to the loss of Lorraine, only a relative trifle being in the Silesian fields.

This leaves Germany with the Westphalian coal field intact and with every reason to press coal output there and to develop new utilizations for coal and for its by-products. But as regards iron and steel, it implies that to produce them on the old scale of output there must be heavy importations of iron ore. These importations, as we know, are actually in progress, chiefly from France, with Sweden, Algeria and Newfoundland following, at great distances, in the order named.

The extent to which the various basal industries have been reestablished since the war is well shown in the following comparison of average *monthly* outputs during 1913, 1926, 1927 and 1928. The figures are in thousands of metric tons:

	1913	1926	1927	1928
Coal output.....	15,849	12,114	12,298	12,500
Lignite output....	11,506	11,656	13,399	14,250
Pig iron.....	1,397	804	1,310	985
Steel output.....	1,412	1,028	1,371	1,210

It will be seen that lignite shows a very steady and rather surprising gain, while coal, iron and steel are still well below their pre-war levels of output. And if to these mere tonnage comparisons we add the fact that almost all the iron is made now from imported iron ore, we can see why the German credit balances on exports, never very large before the war, are now turned into deficits.

Germany still ranks second to the United States in the production of both pig iron and steel. But whereas in 1913 England occupied third place in both regards, and France only a very bad fourth place, today France has easily passed Great Britain and is surprisingly little behind Germany. I can see no reason, except perhaps the urgent pressure of reparations payments, for German retention of second rank in the output of pig iron for more than a few years now. Her hold on the finished steel industry is far more secure, since the factor of ore cost weighs less and less as the product is more and more highly finished.

Prospects of Central and Eastern Europe

In central and eastern Europe there are only three countries that seem to require consideration from the standpoint of international coal and iron trade, and each of these is limited in one way or other, so that it can never reach the levels attained by the United States, Great Britain, Germany or France.

First among the three as a future possibility is Russia, where even misrule cannot always cover up the fact that the Donetz Basin had large coal reserves and sufficient iron ore reserves to present possibilities of becoming some day a very serious mining and manufacturing region. The deficiency there has always been the relative lack of transportation and the poverty of the local markets. The outputs for all of Russia have just been published for two recent half-years as below, all in metric tons:

	Oct. 1-March 31, 1927-28	Oct. 1-March 31, 1928-29
Coal mined	18,503,000	19,744,000
Pig iron	1,622,000	1,877,000
Steel	2,109,000	2,314,000
Rolled products	1,702,000	1,874,000

It will be seen that while pig iron output increased almost 16 per cent for the year, coal output increased less than 7 per cent, which the Soviet report expressly states was due to "a certain lowering of working discipline in the coal fields."

Poland and Czechoslovakia, both remade countries, present certain possibilities and serious differences. Poland has secured coal in excess of her manufacturing needs or probabilities, and this coal is now depressing the German coal trade in all the Baltic region. Czechoslovakia, the best balanced of the new countries, has sufficient coal to be important, enough iron ore to use, and finishing plants on a relatively large scale, so that the mine and furnace output is readily absorbed nationally without affecting any international markets in basal products.

Diesel Engine Heads of Wrought Iron Joined with Copper

Many breakages have occurred in lower cylinder heads on double-acting marine Diesel engines. It is apparently impossible to arrange valve openings symmetrically, and temperature strains induced are too much for the best cast iron to resist.

An alternative successful design was described recently by F. Sass to the Institution of Engineers and Shipbuilders in Scotland. It consists of assembling the complicated head with all its passages from 18 pieces of wrought iron plate, tubes and angles. After these were tightly held together by suitable clamps, the proper amount of copper was wired at each joint, and the assembly heated in a hydrogen atmosphere to 1200 deg. C. Final cooling required 48 hr. The method is similar to the "coppering" process described at length in THE IRON AGE, May 10, 1928. Mr. Sass said the method had long been used for building up diaphragms in the turbine department of the German General Electric works (A.E.G.).

Pulverized Coal in Steel Furnaces

Application of Powdered Fuel to Metallurgical Work Outlined—Both Melting and Reheating Furnaces Served

BY WILLIAM O. RENKIN*

THERE have been approximately 200 pulverized coal plants installed in connection with the iron and steel industry in this country. These pulverized coal plants supply fuel to about 2500 furnaces of the following types:

Puddling and busheling furnaces
Wrought iron pile and faggot heating furnaces
Ingot, slab, billet and rod-heating furnaces
Forge heating furnaces
Rail reheating furnaces
Continuous heating furnaces
Open-hearth furnaces
Sheet and pair furnaces
Open and box annealing furnaces
Malleable iron melting furnaces.

In the paper the author has given information regarding results being secured, rather than to describe equipment. The paper is divided into nine sections:

1—Historical sketch of pulverized coal in metallurgical work, giving credit to Lord and Culliney, who did the pioneer work in this branch of the industry.
2—Types of furnaces using pulverized coal, giving some descriptive data.
3—Fuel costs per ton of product, giving some data on the preparation costs as well as relative costs per ton of steel heated with various fuels, such as: Hand firing with bituminous coal; producer-gas firing (bituminous coal); fuel oil firing; natural-gas firing; by-product coke oven gas firing and a curve chart showing the relative B.t.u. procurable for one cent.
4—Type of equipment required, giving a general description of pulverized coal plant operation rather than equipment details.
5—Advantages of pulverized coal firing, listing under 10 points the advantages and benefits to be derived by using pulverized coal.
6—Furnace efficiencies being secured, giving some data from operation.
7—Elimination of early difficulties, describing some of the early installation troubles and explaining methods of overcoming them, as found by experience.
8—Comparative outputs with different fuels, giving some examples of results obtained.
9—Conclusion, giving some general information and comparative fuel costs.

Some of the particular furnace applications are discussed in the following paragraphs:

Iron Blast Furnaces

Considerable work has been done in the blast furnace branch of the industry, but difficulty has been encountered in getting the pulverized coal to burn and not to precipitate. It has been found possible to feed the pulverized coal directly into the proper part of the blast furnace, thus overcoming, it is believed, the mechanical difficulties which have heretofore prevented proper injection of the coal. Introduction of fuel having a known analysis directly at the melting zone will, no doubt, prove a distinct advantage in correcting errors in mix immediately, instead of after some hours, as in present practice.

Air Furnaces

There are many malleable iron plants in which the melting is done with pulverized coal, and the furnaces for such fuel have been developed to a very high stage of efficiency. In the plant which holds the fuel-ratio record of the United States, 3.8 lb. of iron is melted with each pound of pulverized coal fed to the furnace, or 7,430,700 B.t.u. in the fuel to each 2000 lb. of iron melted. The proximate analysis of the coal used at this plant is:

	Per Cent
Volatile matter	34.8
Fixed carbon	59.0
Ash	5.5
Moisture	0.7
Sulphur, separately determined, less than	1.0

In addition to the exceptionally good fuel-ratio secured by fine grinding and proper drying, combined with an efficient burner arrangement, there has been noticed a decided improvement in the elimination of carbon and sulphur additions to the bath. Practically all air used for combustion of pulverized coal in this industry is at atmospheric temperature, and the present rapid development of suitable air heaters, using the furnace waste gases as a heating medium, will greatly assist in further reduction of fuel consumed.

Open-Hearth Furnaces

Owing to the early difficulties encountered with pulverized coal and the high state of development of these furnaces for gaseous and liquid fuels, there has been little incentive to push pulverized coal as a fuel for open-hearth work. However, the experience of plants operating with pulverized coal shows that this fuel can be used successfully and with a considerable saving compared with oil, natural gas, or city gas.

Open-hearth plants which have been using pulverized coal report successful operation, with fuel consumption ranging from 450 lb. to 600 lb. of coal for each ton of steel. The Eastern Steel Co.'s plant at Pottstown, Pa., has found that a coal having a higher ash content can be used, by grinding more uniformly and drying better.

Early troubles with checkers becoming clogged and deleterious additions of sulphur, as well as ash, to bath prevented the proper advance of this fuel. We have, however, found that these difficulties were mainly caused by improper preparation of the fuel. By getting the coal pulverized so that a sufficient percentage will pass through a 100-mesh screen, with the minimum amount of impalpable powder, we find that the sulphur and ash do not precipitate on the bath, but are carried over into the slag pockets at ends of furnace.

By elimination of checker bricks and the substitution of simple arches it is possible to secure sufficient preheat in the combustion air and get better control of the furnace. It is predicted that within the next few years open-hearth furnaces will be developed which will utilize finely pulverized coal at a fuel consumption of 400 lb. or less per ton of steel melted.

Reheating Furnaces

Many installations of hearth-type side-door furnaces, both in single-end-reverberatory and double-end-reversing design, are giving excellent results. Generally speaking,

*Combustion Engineering Corporation, New York. This is an abstract of a paper read June 20 before the Association of Iron and Steel Electrical Engineers at the annual meeting and exhibition, held in Pittsburgh.

the range in size of material heated in this type of furnace is so great that good efficiency cannot be secured. Yet in furnaces heating steel sections varying from billets weighing 150 lb. to ingots weighing 11,000 lb. the fuel consumption ranged between 350 and 450 lb. of coal per gross ton heated.

In one plant where the range is not so great, the size of material heated being from 4 in. square to 8 in. square, the fuel saving, compared to producer gas, was 100 lb. of coal. Forge furnaces heating slabs and ingots for heavy forge work, where the material must be given two heats, show fuel consumption of 600 lb. of coal per gross ton, including the production of approximately 100 boiler-hp. of steam.

Continuous furnaces are generally of either the end-discharge or side-discharge type. Experience has shown that length of skid pipe from knee to cold end wall and the width of furnace determine the output capacity. But the kind of fuel used greatly affects this output. In properly designed furnaces, pulverized coal will sometimes give an increase in output, over other fuels, as high as 60 per cent.

Heating of steel billets, blooms and slabs requires a mellow flame, with minimum luminous streaks, as this is the type of flame whose heat will penetrate the steel with the minimum surface damage and insure the quickest, most uniform heat throughout. Furnaces using pulverized coal require a lower damper than with other fuels, so as to keep the furnace well filled with heat.

Furnace design should be such as to insure practically complete combustion before the gases cross the bridge wall. The roof should be so designed as to insure the proper position of hot spot. Flat roofs of the suspended type give a more uniform heat across the furnace width than do arch roofs. Wherever possible the combustion chamber should be so placed that a portion of the heat can travel under the steel.

In heating sheet bar and sheets, owing to the need for low-temperature flame control, the central plant bin system has proved the most successful. Pulverized coal is today in successful use alike for high-grade, full-finish and ordinary sheets. Combination sheet and pair heating furnaces on ordinary-finish, or tight iron, are successfully producing sheets with 160 to 180 lb. of pulverized coal per net ton of sheets.

Continuous pair heating furnaces are in general use, and give exceptionally good results. In one 8-hr. turn, one mill, using pulverized coal, heated and rolled 400 pairs of bars, 16,320 lb., and put 1600 sheets, 30-gage, 36 x 72 in., weighing 11,780 lb., into warehouse without any wasters or cut-downs. The same mill heated 744 pairs weighing 22,989 lb. on another 8-hr. turn, and on a third it heated 546 pairs weighing 23,840 lb.

Sheet furnaces of the double-chamber type are operating successfully on pulverized coal, with an average fuel consumption of 151 lb. of pulverized coal per net ton of sheets heated. At the pulverized-coal-fired plant 356 lb. of coal per net ton of steel heated was required for sheet-and-pair-heating and annealing. The above results were all obtained on the production of tight or ordinary finished sheets. For the production of full-finished high-grade sheets specially designed furnaces are required, and the fuel consumption is slightly higher.

Annealing Furnaces

There are some open-flame and continuous type sheet annealing furnaces using pulverized coal successfully, but the principal use of this fuel is in connection with box annealing furnaces. Sheet annealing for both tight and full finish as well as electric steel is being done successfully in many plants. Fuel consumptions of 140 to 182 lb. per ton of sheets are being secured.

In annealing malleable castings fuel ratios of 5 to 1 are being secured, with practically all good castings.

Increase in life of boxes helps to reduce the cost of annealing. Box annealing furnaces in successful operation are of the single-box double-chamber, as well as double-box double-chamber type.

Company Emphasizes Approval of Simplification Program

TO further the work of the Division of Simplified Practice of the Department of Commerce in the simplification programs carried out in numerous industries, the Government department has requested manufacturers who exhibit at trade conventions to state that their products and packing conform to the standards agreed upon by the industry. The illustration shows the manner in which this was done by the Buffalo Bolt Co., North Tonawanda, N. Y., in its booth at the recent convention of the National Association of Purchasing Agents in Buffalo.

Colorimetric Carbon Test Improved

New Equipment Facilitates Comparison of Color Intensities—Details of Apparatus and Method

BY H. L. CAMPBELL*

ANALYSIS of steel for carbon by the colorimetric method is not a difficult task and may be performed satisfactorily by anyone after a little practice. The advantages of this method over other methods for determining carbon are the small amount of equipment required and the speed of obtaining the results of analyses. Much of that used today is crude. That described in this article was designed by the author and is offered as facilitating the comparison of intensity of color.

The equipment required for the color-carbon determination consists of an analytical balance, a water bath, a colorimeter with glass tubes, and some test tubes ⅝ in. in diameter and 6 in. long.

Water Bath and Colorimeter Simply Constructed

The design of the water bath is shown in Fig. 1. It consists of a copper tank 9½ in. in diameter and 7½ in. high. On the inside of this tank is a movable support for test tubes. A cylinder of sheet copper 8 in. in diameter and 5½ in. high is provided with holes ¾ in. in diameter near the bottom and near the top to assist the circulation of the water in the tank. A cover, which is attached to the top of the cylinder, has openings into which 16 test tubes may be placed. A piece of wire screen is soldered to the copper cylinder within 1½ in. from the bottom. The test tube support may be raised from the tank by a handle which is fastened to the center of the test tube support shown in Fig. 1. The level of water in the tank is indicated on the stem of a glass funnel which is inserted in a rubber stopper at the side of the tank. The water bath may be supported on a tripod or ring stand. Heat may be applied to the tank by means of a ring burner or any type of laboratory gas burner.

*Associate professor of metallurgical engineering, University of Michigan, Ann Arbor, Mich.

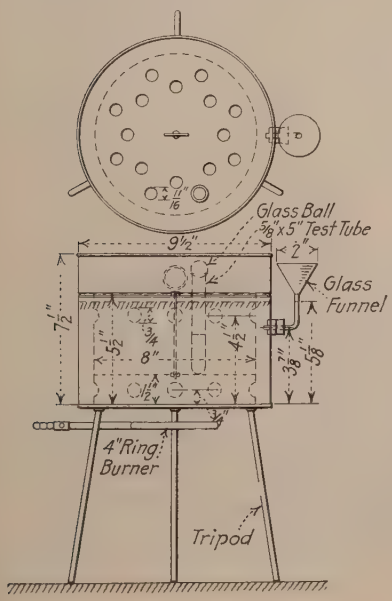

Fig. 1.—Design (Left) of the Improved Water Bath

Construction of the colorimeter is shown in Fig. 2. At one end of an inclosed wooden box an electrical connection is made to an electric light socket on the inside of the box. A blue, daylight bulb is used in this socket. At the other end of the box is a wooden tube through which observations are made. A block of wood forms a partition which divides the inside of the box in two compartments. In this wooden block two round holes are made 9/16 in. in diameter and 5⅛ in. long, as shown.

Directly in line with the opening in the wooden tube, a rectangular hole is cut through the block. A strip of sheet brass is placed across the center of this hole. This strip of brass serves to separate the two glass colorimeter tubes when they are placed in the colorimeter. The round holes 9/16 in. in diameter are continued through the cover of the box. These holes serve to hold the color-comparison tubes during a test. The colorimeter may be placed in any position which will permit convenient observations through the tube of the instrument.

Solution Required and Method Used

The solution required for dissolving the steel samples consists of equal volumes of nitric acid and distilled water. Details of this method of analysis are as follows:

Use 0.200-gram samples of steel and place in test tubes which are set in a bath of cold water. At the same time weight out a 0.200-gram sample of a standard steel which has approximately the same composition as the unknown steel.

A proper amount of nitric acid solution is added from a burette to each test tube; for carbon up to 0.3 per cent, use 3 cc. of acid; for carbon up to 0.5 per cent, use 4 cc. of acid; for carbon up to 0.8 per cent, use 5 cc. of acid; for carbon up to 1.0 per cent, use 6 cc. of acid.

The test tubes are left in the cold water until violent action ceases. Then the water is heated slowly up to 80 deg. C., which should require about ½ hr. The mouths of the test tubes are closed by glass balls to prevent drying of the iron salts on the sides of the tubes. The tubes are shaken several times during the heating periods. After the reactions are completed, the tubes are placed in a bath of cold water.

A solution of the standard steel is poured into one of the comparison tubes. The solution is diluted to a con-

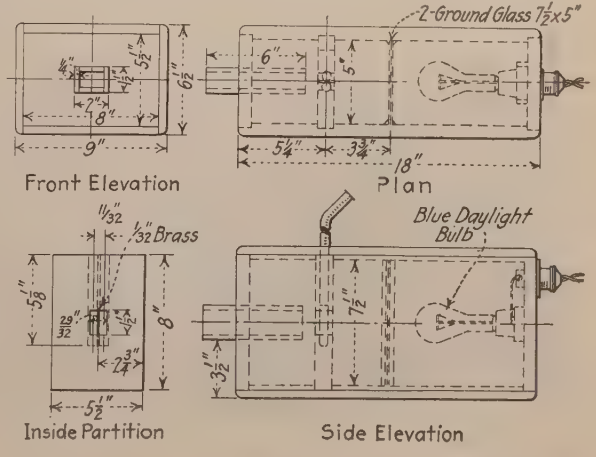

Fig. 2—Details (Right) of the Construction of the Colorimeter

venient multiple of the carbon content of the standard. For example, 0.45 per cent carbon sample may be diluted to 9 cc.; then each cc. will represent 0.05 per cent carbon.

In the other comparison tube, dilute the solution of one of the unknown steel samples until it matches the color of the standard.

Calculating Carbon Percentages

The percentages of carbon in the two samples are to each other as the volumes of the solutions in the comparison tubes. If each cubic centimeter of the solution of the standard represents 0.05 per cent carbon, and 13 cc. is the volume of the solution of the unknown steel when the colors match, the carbon content of the unknown steel is 0.65 per cent.

The standard steel used in this method must be of exactly the same kind as that to be tested, and also similar in its composition and of approximately the same carbon percentage.

Copper, cobalt and chromium interfere with this determination. High sulphur may make the solutions slightly turbid.

Standard samples of steels with different carbon contents may be obtained from the United States Bureau of Standards, Washington.

It is desirable to obtain a quantity of borings from a representative sample of the steel which is being produced and to use this material as a standard for color-carbon determinations, after establishing definitely the carbon content of the standard.

Fusion Welds in Duralumin

Fusion welds can readily be made in sheet or strip duralumin, according to *Oxy-Acetylene Tips* for June. If the adjoining edges are flanged and a corrugation made parallel to the seam about 2 in. from the weld, the expansion and contraction effects will be absorbed. The seams should be opened at one end an amount equal to ¼ in. per foot of weld. Welding should be continuous and produce a well-reinforced seam; rewelding cannot be done.

Welding rods of aluminum containing 5 per cent silicon are satisfactory; this alloy has a lower melting point than duralumin, and some of the contractions in the joint occur before the weld metal is entirely solid. Joints and rod should be scrupulously clean and coated with the flux ordinarily used for welding aluminum, mixed with water to a creamy paste. During welding the oxy-acetylene flame should be given a semi-circular motion with the rod at the center of the circle; the flame is so inclined as to preheat slightly the metal next to be welded. The finished joint should be scrubbed clean of flux with hot water.

Such welds, while perfectly tight against benzol, have a maximum tensile strength of 30,000 lb. per sq. in. If the completed part is quenched in cold water from about 900 deg. F. and then tempered in boiling water, the average tensile strength should be about 43,000 lb. per sq. in. (figured on the cross section of the sheets joined). This compares with 55,000 to 63,000 lb. per sq. in., the average strengths of common duralumin after heat treatment.

Polished Allegheny Metal Sheets Cover Corridor Bridge

ALLEGHENY metal with its glistening silver-like finish covers the pedestrian bridge which now connects the new Chicago Daily News Building and the Northwestern Railroad Terminal, Chicago. It is a chrome-nickel iron, proved to be practically impervious to the corrosive action of the elements, and to withstand severe weather conditions without losing its highly polished finish. Only an occasional wiping with a damp cloth is needed to maintain the luster.

The 5 tons required for the roofing, window frames, and siding of the 125 ft. span were furnished by Joseph T. Ryerson & Son, Inc. The bridge was built jointly by the Chicago *Daily News* and the Northwestern Railroad for the convenience of some 60,000 commuters, who in the past were forced to wait many minutes daily in crossing the heavily congested street between the two buildings. Incidentally, both buildings are using installations of Allegheny metal in their cafeterias. The sheet metal work was done by J. Smith and the windows by the Voigtman Co., Chicago. The bridge is shown below and its position between railroad station and the new building is shown by the arrow in the other picture.

Signs of Overproduction Appearing

Steel Output 45 Per Cent Above Normal, with Demand Falling Off—No Sharp Decline Expected

BY DR. LEWIS H. HANEY
DIRECTOR, NEW YORK UNIVERSITY BUREAU OF BUSINESS RESEARCH

OUR SURMISE that June would show a decided excess of steel production over indicated current requirements has been confirmed. In May, our "composite demand line," based on the activity of the chief consuming industries, declined while steel production increased, and preliminary estimates for June show a continuation of these divergent trends.

This is the first time that a similar situation has appeared since April and May in 1927. Even then, the indicated consumption declined less sharply than last month, and production of steel was relatively less in excess than now appears to be the case.

What this development may mean is uncertain, but apparently we can no longer say that steel production is well balanced with relation to current requirements. It seems fair to say that, on the average, production considerably exceeds requirements. Also it can be said that, if the production is not actually in excess of orders, then the orders are themselves being placed in excess of actual requirements. Statistics throw no light on the latter possibility. All we know is that unfilled orders decreased so much less than usual in June, in spite of the heavy production, as to be equivalent to a virtual increase.

The decline in the composite demand line during May resulted from a downward trend in our adjusted indexes of building activity, automobile production, mining, and exports of iron and steel. Declines in these items more than offset small increases in railroad transportation and in general manufacturing activity.

Chief Consumers Show Declines

Preliminary estimates for June, based on automobile, building and railroad figures (which industries taken together consume half of the steel output), indicate a somewhat larger decline in current requirements than occurred in May. Even allowing for the usual seasonal decline, automobile production was reduced more sharply than in May. It is still very large, but continues to point downward. Building activity was off again and showed the lowest annual rate since 1924. Railroad car loadings fell below May, declining a little more than usual for the season.

This gives a sufficient basis for estimating a downward trend and, as steel production increased sharply in June leads to the conclusion that unless the output is curtailed soon, a condition of over-supply is in the making.

Of course, the activity of consuming industries may pick up. But in what direction does this seem probable? Certainly no sustained advance in building activity is to be expected so long as money remains tight and the bond market is depressed. Automobile production promises to continue large, but its downward trend now seems well established, particularly in the heavier cars. Mining activity is limited, as coal is one of the depressed industries, while copper prices can be maintained only by curtailing production and the oil situation is uncertain, to say the least. Assuming the soundness of these statements, we can hardly expect railroad traffic to expand, considering the season, especially with the recently announced reduction in the estimates of the wheat crop. On the whole it seems that, in spite of the large construction projects, such as pipe lines, and a very good volume of railroad equipment business, steel requirements, both domestic and export, seem likely to decline moderately rather than to expand. The indicated requirements as of June, however, continue very large, being considerably greater than in most of the months of 1927.

Construction and Automobiles Both Point Downward

BRIEFLY, the facts concerning two of the steel industries' customers are as follows:

Building contracts, according to all measures, were off more than usual in June, and were much below a year ago. Our adjusted index based on floor space, and taking the average of the years 1921-1927 as 100, was 101.1. This compares with 109.7 in May and 130.6 last year. It represents the poorest showing made, probably, since November, 1924, and certainly since March, 1925. Moreover, the value of contemplated new construction declined, and permits were sharply reduced. Building permits in 180 cities, making due allowance for seasonal variation, were the lowest since 1921. This situation finds expression in the relatively unfavorable showing made by lumber, cement, brick, sanitary enameled ware, radiators, boilers, galvanized sheets and nails.

Preliminary estimates for automobile production put June at 536,300 cars and trucks, which is an average of about 21,450 a day, against 24,440 in May. This represents a more than seasonal drop and our preliminary adjusted index based on the average of 1921-1927 is 161 against 171 in May and 122 a year ago. May sales by General Motors made an unfavorable showing, as cars sold to consumers fell behind a year ago and dealer inventories showed an unseasonable increase. The two leading manufacturers of low-priced cars are running strongly, but the total production of all cars is evidently ahead of sales and a more than seasonal curtailment that began in May is still under way.

Though both of these industries are thus on the decline, building contracts are still above the average of recent years, and automobile production shows a rate about 60 per cent above that average.

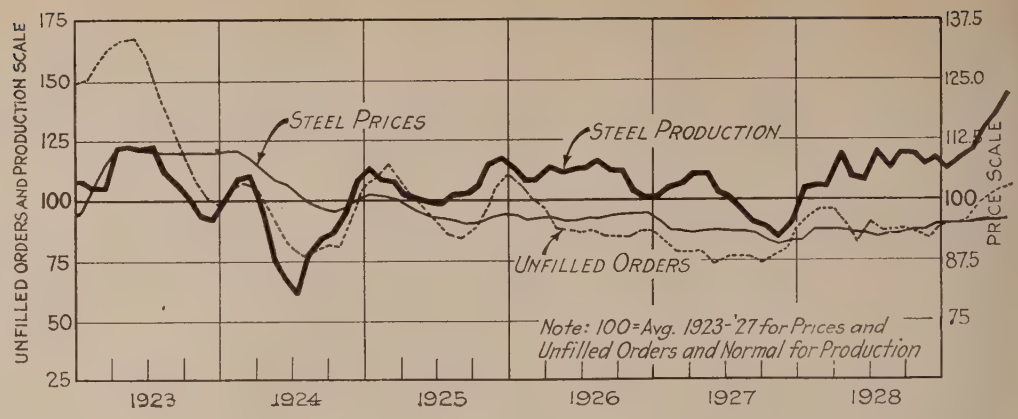
Outpouring of Steel Ingots at Record Rate

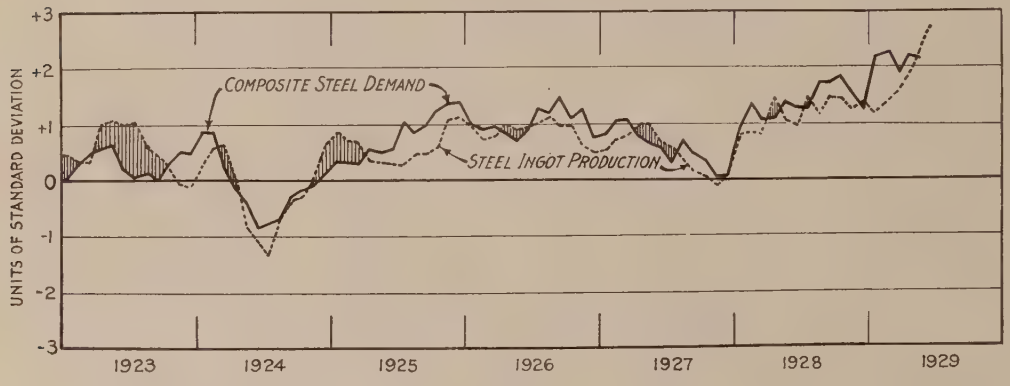
THERE was an extraordinary increase in our June index of average daily steel production. This is the only time since 1922 that steel production has increased considerably more than usual for the season in that month. In 1926 there was a slight gain, but it was not considerable. Only in 1922, during the rapid recovery from the depression of 1921, do we find such a rise at this season. And in 1922 steel prices were rising and unfilled orders rapidly increasing.

The index referred to as nearly 45 per cent above normal and stands at a level unapproached in any post-war year. Unless the industry is in the process of overturning all precedent, such an abnormal rate of production, in excess of indicated requirements, cannot long endure. Barring the unlikely event of an inflationary spurt in general business this fall, a declining trend is to be expected within a very few months.

Unfilled orders decreased slightly, but considerably less than usual for

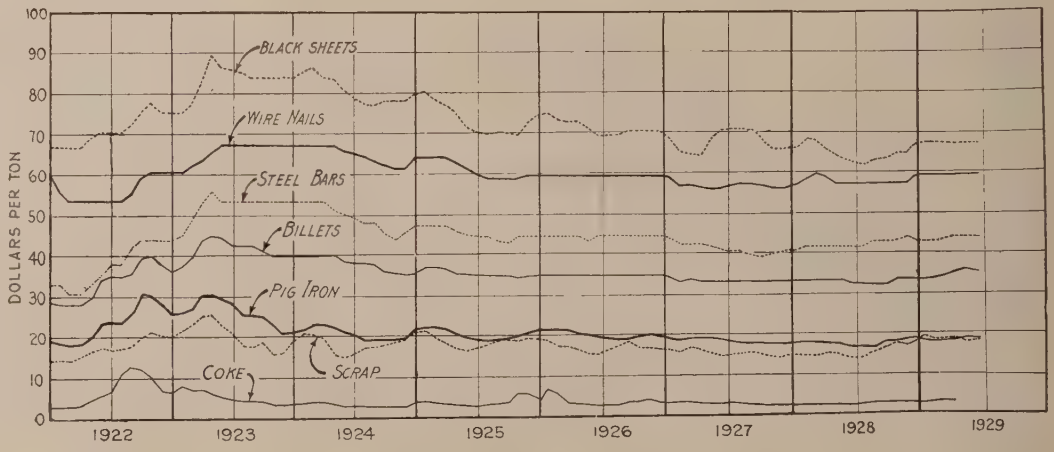
STEEL Production in May Was 36 Per Cent Above Normal Requirements and Went Up to 45 Per Cent in June. Prices may have reached a peak. Unfilled orders decreased by less than a seasonal amount

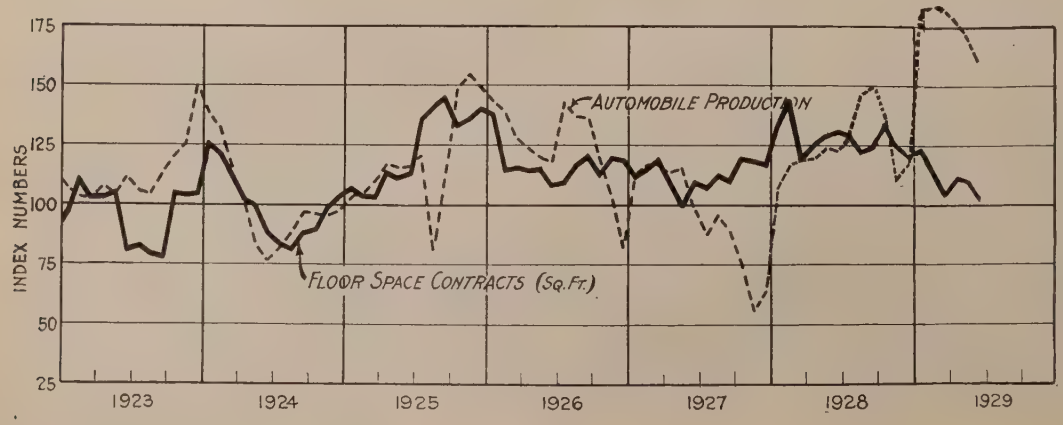




COMPOSITE Steel Demand Has Fallen Well Below the Level of Ingot Production (Adjusted). It is believed that demand will show a further moderate decline

COMPARED with Coke and Semi-Finished Steel Prices, Pig Iron Seems to Be in About a Normal Position; But It Is Relatively Cheap When Compared with Either Steel Scrap or Most of the Items of Finished Steel. It shows no present tendency of strengthening





AUTOMOBILE Output, at High-Record Levels, Has Declined and Will Drop Lower. Building has been moving downward again since the temporary April upturn

the season, our adjusted index rising to 105.5 per cent of the average for the five years 1923-1927, which compares with 90 per cent a year ago. This is the highest level of unfilled orders, considering the season, since January, 1926, when the index was 106.4. Evidently the usual sequence of events is working out and forward buying has increased more than had been anticipated. In view of the heavy production and shipments during June, the showing is remarkable.

Yet the average price of finished steel remains unchanged at only 95.6 per cent of the five-year average. This compares with 92.7 per cent a year ago. The failure of prices to advance, to say nothing of the reported weakness in some items, while unfilled orders and production have increased, suggests that the end of the expansion period is near. It indicates the approach of a decline in unfilled orders. The present rate of steel production can hardly be maintained without that result.

High Pig Iron Output Is Yet Below Steel

ON the other hand, pig iron production held practically level in June, at a rate of 26.7 per cent above estimated normal. This is a very high rate—the highest since July, 1923—but it is notable as being the lowest in comparison with steel production since July, 1922.

In 1922 there was a similar sustained mid-year output of steel, the production curve running above pig iron as much as it did last month. This is an interesting situation. Rarely do we find a peak in the steel cycle without pig iron production running relatively high as compared with steel production. Thus precedent in this respect suggests that further expansion in pig iron production lies ahead, although at present pig iron prices seem too low to allow such a development. At an average of $18.65 in June, THE IRON AGE composite price compares with $18.70 in May and is only 87.2 per cent of the five-year average.

Some Maladjustment in the Price Structure

WE thus find many unusual and conflicting indications. Perhaps the condition of pig iron prices is characteristic of the whole situation. Compared with coke, billets and bars, pig iron prices are about normal. Compared with steel scrap and the average price of finished steel, pig iron may be called cheap. Now that steel production is so high in comparison with pig iron production, a stronger pig iron market would ordinarily be considered probable.

Yet pig iron production has probably never been long maintained at the existing high levels without a decline in prices, and the monthly average of pig iron prices was lower in June (as predicted), a fact that generally has some significance, because this index rarely reverses itself abruptly. Moreover, the building situation has reduced the demand for heating and plumbing fixtures and the weakness of the bond market is reflected in the dullness of the cast iron pipe demand.

Probably this mixed situation means a mixed market, with no decided general trend in the very near future. In general, mixed trends seem probable as to steel prices, the markets varying with the demand, with some weakness where building or automobile uses are the chief factor.

June British Iron and Steel Output Large

LONDON, ENGLAND, July 15 (*By Cable*).—June production of pig iron was 657,800 gross tons and that of steel ingots and castings was 830,900 tons. The June pig iron output was the largest this year, while that of steel was the third largest, which was the 859,900 tons in March.

Comparisons of present output with other years is as follows:

	Pig Iron, Gross Tons	Steel Ingots and Castings, Gross Tons
1913—Av. monthly..	855,000	638,600
1920—Av. monthly..	669,500	755,600
1922—Av. monthly..	408,500	490,100
1923—Av. monthly..	620,000	706,800
1924—Av. monthly..	609,900	685,100
1925—Av. monthly..	519,700	616,400
1926—Av. monthly..	203,500	296,700
1927—Av. monthly..	607,800	758,200
1928—Av. monthly..	550,900	710,400
1929—Av. first quar..	558,000	801,400
1929—April	611,300	808,600
1929—May	654,800	840,400
1929—June	657,800	830,900

The monthly average pig iron output for the half year was 597,900 tons, exceeding the 1928 monthly average of 550,900 tons. Steel output for the first half has averaged 814,000 tons per month, comparing with 710,400 per month last year. The rate this year is the highest since the war.

Seek Funds for Industrial Standardization

The board of directors of the American Standards Association has decided to launch an extensive national campaign to finance industrial standardization activities on a basis merited by the savings which these activities are securing for American industry. A finance committee, consisting of Bancroft Gherardi, chairman, Quincy Bent and Howard Coonley, was appointed to head this effort.

The association is a national federation of 40 government, technical and trade associations and includes in its membership the United States Department of Commerce, of which the Bureau of Standards is a division. It serves to impart a definite status to standards which are prepared by industry in accordance with the association's procedure, through declaring them American standards, after a consensus has been reached among the various groups substantially concerned—producers, consumers, distributors and general interests.

Small Loss in Corporation's June Orders

A small decrease was registered in the unfilled orders on the books of the United States Steel Corporation in June after a fairly large decline in May. Previous to May there were five successive monthly increases. The June decrease was 47,257 tons as compared with 123,596 tons in May. A year ago there was an increase in June of 220,991 tons. The table gives the data for the last 18 months.

Wooden Cable Reel Heads Bored in One Operation

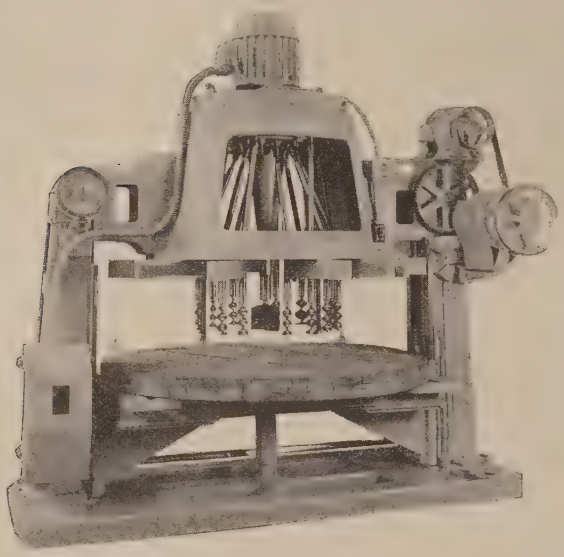
RUGGED construction, large universally adjustable spindles and powerful feed mechanism are basic features of a vertical multiple-spindle borer developed by the B. M. Root Co., York, Pa., for boring all the holes in the heads of wooden wire and cable reels. Clearance between the upright columns is 74 in., which permits handling reels 72 in. and less in diameter.

The machine has a heavy one-piece cast base, cored columns and two table supports. The latter have long square-lock gibbed bearing contact on the slideways of the columns, and carry a series of I-beams that provide a bed for attaching the wood top upon which the stock to be bored is mounted. The table is counterweighted to lessen the resistance of the feed works while boring. It drops by gravity when released by the knockout rod, its downward movement being controlled by two friction brakes and a pneumatic plunger. There are two motors, a 5-hp. feed motor mounted with the feed mechanism on the right-hand column, and a 15-hp. vertical spindle-drive motor, which is located on the spindle hood. Push button control is provided, both motors being started and stopped together.

Feed control is by means of a foot trip mounted on the base. When depressed, this trip causes the table to be raised automatically to the boring bits. An adjustable knockout rod releases the feed at any point, permitting the holes to be bored to a predetermined depth.

The spindle hood, attached to the upright columns, carries the spindle drive motor, the gear plate and the gear casing for the spindles. The transmission gears in the top of the case are of helical type and run in grease. All spindles except the center spindle, which is fixed, are of universal type, and are adjustable 6 in. in all directions from vertical. They are bronze bushed and equipped with ball bearings to take end thrust.

The distance from the spindle noses to the table in lowest position is 16 in. and distance from spindle noses to floor is 44½ in. The wood table measures 53 x 60 in. The height of the machine is 9½ ft. overall, and the floor space occupied is 5 ft. 2 in. by 10 ft. 4 in. The shipping weight is 8000 lb.



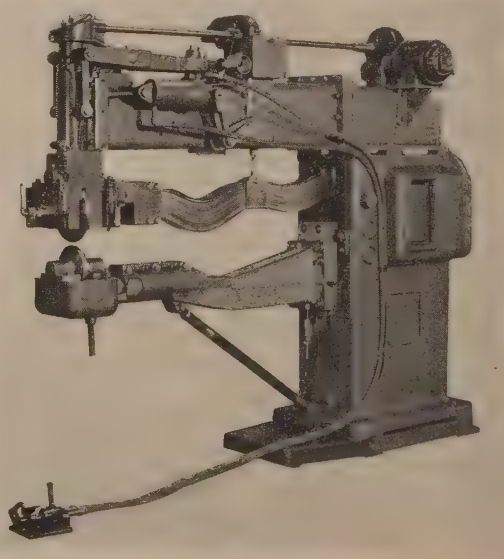
ALTHOUGH Designed for Boring Cable Reel Heads, the Machine May Be Used for Boring Other Wooden Pieces

Rugged Seam Welder for Continuous Operation

A SEAM welder known as Model 375, capable of making joints 48 in. from the nearest edge, has been developed by Thomson Electric Welding Co., Lynn, Mass. It is rated at 175 kva. and is air operated. Current control is automatic.

The upper roller or electrode is motor driven, as shown in the view; the lower roll idles. These and their bearings are unusually rugged to resist service abuse, yet easily replaced when repairs or dressing is necessary. Rollers are water cooled, and the whole machine is built for heavy-duty operation, 24 hr. a day.

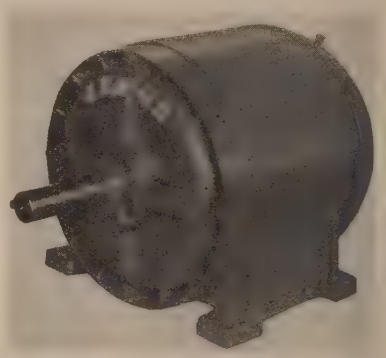
When a different class of work is to be done, the entire lower roll unit can be quickly replaced by another of appropriate design.



FLAT Sheets May Be Welded to Make Continuous Wide Strips. The depth of throat is 48 in. Automatic current control is provided

Abrasion-Proof Induction Motors Offered

A NEW line of inclosed electric motors, in ratings of from ½ to 50 hp., 550, 440 and 220 volts, 2 and 3-phase, 25 and 60 cycles, has been developed by the Armor Electric Mfg. Co., Erie, Pa. The motors are of the squirrel-cage induction type, and are said to be particularly suitable for use under conditions where the atmosphere is likely to be impregnated with explosive fumes or abrasive dust, such as chemical plants, coal mines, foundries or cement plants.



Completely Inclosed, This Motor Is Offered as Proof Against Abrasion or Explosion

The stator is of the skeleton-frame type, the frames being made of especially heavy castings, with the feet cast integral. Rigidity of construction is secured by heavy flanges and cross ribs. The core is made up of

high-silicon steel laminations, keyed to the stator ribs, and having partially closed slots. The core steel has been selected as a means of improving both the power factor and general efficiency of the motors. The windings are of the concentric type, with one phase to the slot. Timken roller bearings are used.

Clamshell Bucket Handles Variety of Material

A POWERFUL digging bucket that can be adjusted for the kind of material being dug has been brought out by the Erie Steel Construction Co., Erie, Pa. It has been named the Multi-Power from its working action, which combines the multiple rope and the lever arm principles. The former provides power, but slows up the action of the bucket, while the lever arm principle gives speed as well as power. It is stated that the combination provides better digging and

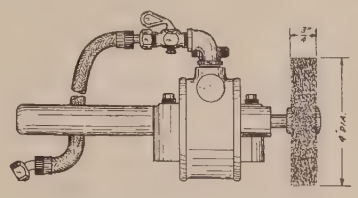
Bucket for Digging or Rehandling. It can be adjusted for kind of material being dug

faster operation and also enables designing a bucket requiring considerably less head room, with less line to overhaul. The bucket can be rigged with from two to six parts of line.

Scoops are made oversize with but little added bucket weight. Counterweights are in 100-lb. units which are attached to the bucket by two bolts and can be put on or taken off conveniently by one man. Stops are of improved design; they are relocated and made longer so that they add reinforcement to the arm. The main bearing has been made wider to better withstand shocks of digging and to eliminate excessive wear. All ropes end in a wedge and socket. Power arm sheaves may have either plain or roller bearings. The sheaves are of steel and are equipped with cleaners. Heavy down-thrust lugs are provided on the bucket scoops to relieve the rivets, the down thrust being on the edge of the bucket, thus forcing the scoops into the materials while closing. Lubrication is by the Alemite system.

Air-Operated Wire Brush

FOR the rapid removal of rust, scale and loose paint from the surface of steel and other materials before painting, the Paasche Airbrush Co., 1909 Diversey Parkway, Chicago, is offering a portable air-operated wire brush cleaner.



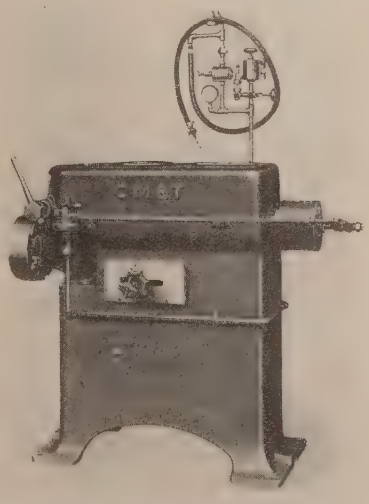
Wire Brush Machine Weighing 10 Lb. It is 4½ in. in diameter and 11 in. long

The machine weighs 10 lb., and is 4½ in. in diameter and 11 in. long. It may be equipped with a ¾ x 4 in. or 1 x 6-in. wire wheel. From 8 to 16 cu. ft. free air per minute is required, depending upon the speed of operation, which is regulated by means of an air valve.

Gear Burnisher Arranged for Rapid Operation

UNIFORMITY of pressure applied to the gears being burnished, minimum of set-up time, and rapid operation are features claimed for the Bolender gear burnishing machine marketed by the City Machine & Tool Works, Dayton, Ohio.

The uniform pressure is obtained by means of an air cylinder and valves which control the movement of a member carrying two burnishing rolls. The pressure applied is registered constantly on a dial gage and can be checked at a glance by the machine operator or foreman. Gears are burnished with their center line vertical, to assure a straight bearing on gears of any weight or length. Gears of various lengths or diameters are accommodated by moving the supporting member upward, downward or sidewise by means of hand knobs shown in the illustration. It is claimed that from 2300 to 3000 gears, 6-8 pitch, 16 to 30 teeth, can be burnished in a 9-hr. day.



From 2300 to 3000 Gears of 16 to 30 Teeth, 6-8 Diametral Pitch Can Be Burnished in 9-Hr. Day

Motor-Driven Grinders with 6 and 8-In. Wheels

NEW motor-driven grinders equipped with 6 and 8-in. wheels have been brought out by the Hill-Curtis Co., Kalamazoo, Mich. Either bench or pedestal mounting can be supplied and the motor may be either alternating or direct current of stand-

Bearings and Motor Are Fully Inclosed

ard specifications. Oversize ball bearings are mounted in the end head in close proximity to the wheels, and all bearings are entirely inclosed to protect them from dust and grit. There are no holes or open slots in the motor housing or end bells, which eliminates danger to the windings from accumulations of emery grit and dust.

Two-pole quick make-and-break switch is standard equipment. Wheel guards and tool rests are adjustable to the wear of the wheels, and can be removed conveniently when the character of the work does not permit their use. Single-phase, alternating current machines are equipped with an improved commutating-type repulsion-induction motor. Low voltage is said to have no objectionable effect, the starting current being unusually low, thereby adapting the machine for attachment to lighting circuit outlets.

Rights to manufacture the oscillating spindle sander, heretofore made by the Emmert Mfg. Co., Waynesboro, Pa., have been acquired by the Porter-Cable Machine Co., Syracuse, N. Y.

Advanced Method of Installing CO_2 Meters

A NEW method of installing CO_2 apparatus, working on the thermal conductivity principle, has been developed by the Brown Instrument Co., Philadelphia. In this system of analyzing gases, the relative capacity of air to conduct heat, as compared with the gas to be analyzed, is used to operate electrical indicating and recording instruments calibrated directly in per cent of CO_2.

In the illustration is shown the latest method of installing this apparatus, eliminating the trouble heretofore experienced due to clogging and gas leaks. A primary filter consisting of perforated metal, supporting asbestos cloth, projects into the flue or furnace. The pipe supporting this primary filter slopes downward from the filter, at 5 to 10 deg., so the moisture is drained off.

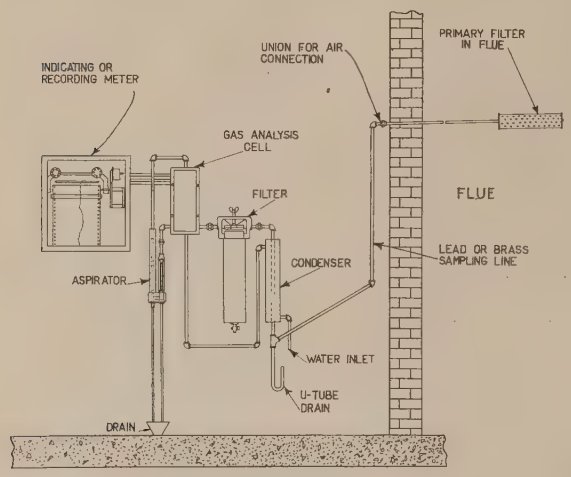
From here the sampling line runs directly down to the U-tube drain, which collects excess moisture and acid. The gas then passes through a condenser, where it is cooled to prevent any accumulation of moisture in the analysis cell.

A union connection is made at the sampling tube so the primary filter can be blown out occasionally. In practice, this blowing out is done infrequently. A secondary filter consisting of a container with steel wool and cotton is placed in the line in front of the cell.

In the thermal conductivity cell are four platinum filaments of comparatively heavy wire, mounted in gold plated cells with gold lined passages. Two of the cells contain air. The other two contain gas to be analyzed, the thermal conductivity of which is to be compared to air.

From the cell, a 5-wire cable runs to indicating or recording instrument calibrated directly in per cent of CO_2. This instrument may be located at a distance, without affecting the time lag.

This new piping arrangement, with improved condenser, filter and cell assembly, is said to mark a substantial advance in the perfection of CO_2 analyzing apparatus operating on the thermal conductivity principle.

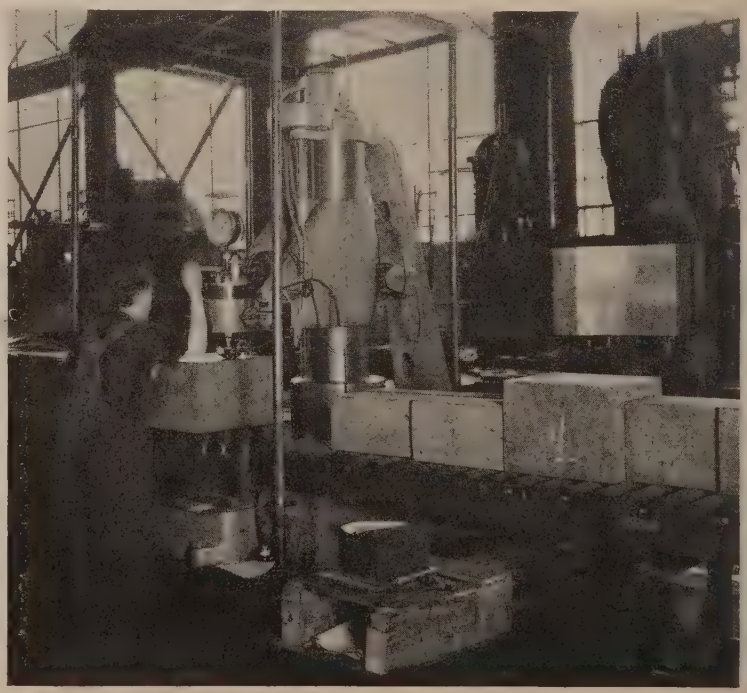


New Arrangement for Connecting Up Instruments for Measuring Carbon Dioxide Content of Flue Gases. This is said to provide exceptionally accurate results

Improved Accurate Method of Testing Die Blocks

A SPECIALLY built Brinell machine for the testing of all die blocks has been installed by the Heppenstall Forge & Knife Co., Pittsburgh, manufacturer of Hardtem die blocks, shear knives, electric induction steels, and miscellaneous heavy forgings.

The face surface of each die block is stamped near each Brinell ball impression, showing the diameter in millimeters of this impression. In conjunction with the company's engineers, this machine was built by the Pittsburgh Instrument & Machine Co. The illustration shows the machine in operation.



Die Blocks Being Tested for Brinell Hardness by a Specially Built Machine

Causes of Porosity in Cast Bronzes

ARGUMENTS which seek to blame the cause of porosity in bronze castings on oxides, gas occlusions, improper mixing or similar secondary matters, without full reference to the volume change on freezing and the freezing range, are likely to be very misleading; these two latter effects are of supreme importance, said H. C. Dews in his paper, "The Metallurgy of Cast Bronzes," before the Third International Foundrymen's Congress in London, June 11 to 14.

There seems to have been a general avoidance in the past of any discussion of such a point of view, and on account of this remission, there is at present a disappointing paucity of important fundamental data thereon. If foundrymen were to develop a more sympathetic attitude toward research and a greater freedom in discussing their troubles, there is little doubt that research could quickly be guided into channels of profitable incidence on practice.

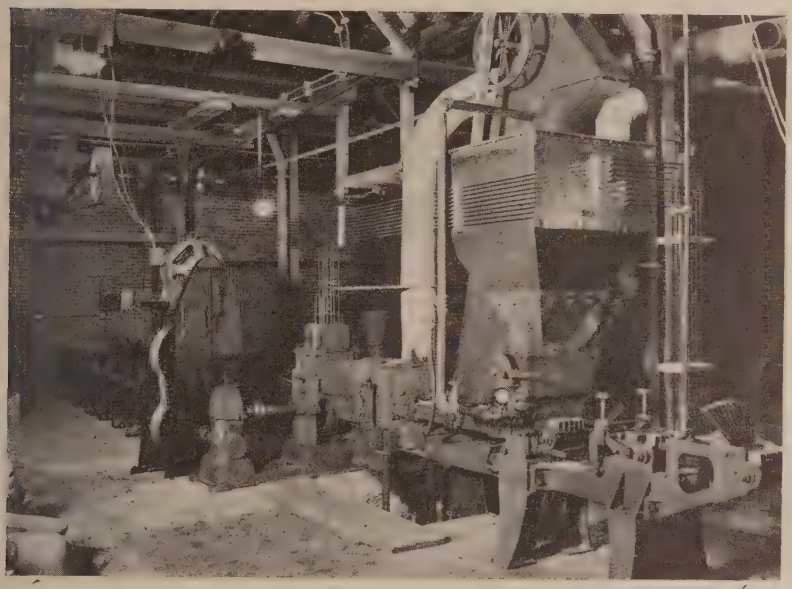
Cleaning Strip Steel Mechanically

New Machine Obviates Need for Pickling to Remove Scale

A MACHINE has been developed and put into operation for cleaning or removing scale from hot-rolled and annealed strip steel, eliminating the acid pickling process. This was designed and developed by C. A. Dreisbach and his associates of the Standard Equipment Co., Inc., New Haven, Conn. Mr. Dreisbach has designed various types of equipment used by foundries and manufacturing companies for cleaning and removing scale from castings, forgings, heat-treated springs and other articles. Most of these employ the principle of abrasive blasting with compressed air at low and high pressures. He attempted to use the same principle in cleaning cold-rolled steel-strip rod and wire but found that, although the abrasive material would remove the scale, it would at the same time produce pits in the stock. This, of course, was an objectionable feature. It was found by investigation that the depth and size of the pits thus formed varied in relation to the angle of impact.

After various tests covering the best kind of abrasive, the angle of impact and the compressed air operating pressure for producing the most effective results in removing scale and producing a pitless smooth surface, Mr. Dreisbach made the experimental machine which was then used for making further tests in cleaning hot-rolled and flat annealed stock up to 1 in. wide and also No. 5 rod and wire. The result was a machine which removed the scale and produced a smooth finish.

Further experiments were necessary to determine the most efficient sizes, designs and combinations of air nozzles, scouring chambers, etc., during which there was produced a combination that increased the linear cleaning feet to a maximum output with the lowest consumption of compressed air, abrasive and wear on the scouring chamber, air nozzles, etc. Finally a complete machine was designed, the parts of which may be removed and replaced in a few minutes, without taking out the strands of stock from the machine. This machine was found to remove scale and oxide from copper alloyed rod at the rate of 50 to 70 ft. per min. Another machine of the same model cleans steel golf shafts at the rate of 6 per min.



Scouring Machine Developed to Clean Strip Steel Instead of Pickling

A steel company which manufactures high and low-carbon cold-rolled strip steel installed the first model of these automatic scouring machines, shown in the illustration. This machine will take a continuous feed of one or more strips up to 7 in. wide and is cleaning two sides and edges of hot-rolled high-carbon steel at the rate of 35 to 45 ft. per min. and annealed and tempered stock at 40 to 60 ft. per min. in one pass.

The control levers for operating the pulling roll are within easy reach of the supply-stock man at the front end of the machine. Each winding drum, or reel, is provided with a clutch foot-lever control to stop the machine to remove the finished coil and take up and wind new coil coming through. The abrasive, or sand, in the scouring machine is used over and over, and the dust is removed by an exhaust system into a cloth screen dust arrester.

Another machine is now being designed which, it is claimed, will take one or more strands of stock up to 14 in. wide and wider models are contemplated. Other types of scouring machines will also handle wire and rod up to about ½-in. diameter in any number of strands equal to the width or capacity of the scouring chamber. The patents covering these machines are owned by the Standard Equipment Co., Inc.

Builds Ladder with Steel Safety Rungs

STEEL rung safety ladders and steel tread safety platform ladders are now being offered by the Lourie Mfg. Co., 410 Sharples Building, Chicago.

The steel rung safety ladder is made in straight and extension types; also in a combination extension and trestle with quick attaching and parting device for attaching the ladders in trestle formation and for separating them to make an extension. These ladders are equipped with flat surface steel rungs bolted to straight grained spruce side rails, each end of the rung being further reinforced by a penetrating ear which in assembly is embedded in the side rail.

The two points of contact at each end of the rung produce a bracing effect that serves to prevent twisting or weaving. With this system only 5/16-in. holes are required in the side rails instead of the usual 1-in. holes for wooden rungs, and there is no shrinking of rungs, of course. The extension ladders slide rail over rail, permitting ladders to be extended to within one foot of the total length. The ladders may be tightened with a wrench at any time.

Platform ladders are constructed of straight-grained spruce throughout and have a large working platform of ample size for two men. This platform has heavy steel angle supports with an automatic lock which cannot be released until the weight is removed from the ladder, when it can be easily operated with one hand. Steps are supported with steel angle brackets and tied to the side rails with bolts.

An addition to its by-product coke plant at Aliquippa, Pa., will be made for the Jones & Laughlin Steel Corporation by the Koppers Construction Co. The addition will consist of 81 Becker-type ovens with an annual coal carbonizing capacity of 850,000 net tons. Auxiliaries will include additions to by-product, benzol and material handling plants and boiler house. On completion, the plant at Aliquippa will have 203 Becker type ovens with an annual coal capacity of approximately 2,000,000 tons.

Mechanical Engineers' Part in Metal Congress

The iron and steel division of the American Society of Mechanical Engineers, from Sept. 11 to 13, will hold its fall meeting in Cleveland in conjunction with the National Metal Congress. The first session will be on Wednesday afternoon, Sept. 11, with presentation of the following papers:

"Developments in Blast Furnace Design and Practice," by Arthur G. McKee, Cleveland.

"Ore Handling Bridges," by Alexander C. Brown, president Industrial Brownhoist Corporation, Cleveland.

"Oil-Electric Locomotives in Steel Mill Transportation," by W. L. Garrison, assistant manager locomotive department, Ingersoll-Rand Co., New York.

On Wednesday evening there will be a dance and entertainment, and a plant inspection trip will be made Thursday morning. Thursday afternoon there will be a joint session with the American Welding Society, when the program will be as follows:

"Non-Destructive Tests of Welds," by Elmer A. Sperry, president American Society of Mechanical Engineers.

"Foreign Practice in Welding Boiler Tubes and Drums," by George A. Orrok, consulting engineer, New York.

"Automatic Arc Welding of Thin Sheets," by W. L. Warner, industrial heating and welding engineering department, General Electric Co., Schenectady, N. Y.

Friday morning two papers will be read, one on "Alloy Steels in Iron and Steel Mill Equipment," by M. J. R. Morris, Central Alloy Steel Co., Massillon, Ohio; and the other on "Evolution of Drives for Mill Table Rollers," by K. Feller, Schloemann Engineering Co., Pittsburgh.

The final session, held jointly with the American Society for Steel Treating, is scheduled for Friday afternoon, Sept. 13. The program includes the following papers:

"Distribution of Heat in Combustion Furnaces," by M. H. Mawhinney, Electric Furnace Co., Salem, Ohio.

"Advantages of Producer Gas as a Fuel Compared With Other Forms of Fuel," by Victor Windett, Wellman, Seaver, Morgan Co., Cleveland.

"Powered Coal Cupola," by D. H. Meloche, American Radiator Co., New York.

Charles Piez Nominated President of A. S. M. E.

Charles Piez, chairman of the board, Link-Belt Co., Chicago, has been nominated as president of the American Society of Mechanical Engineers and will be elected by letter ballot to take office at the time of the next annual meeting of the society in the first week of December. Nominees for vice-president for a two-year term are Paul Doty, chairman Minnesota State Board of Registration, St. Paul; R. E. Flanders, manager Jones & Lamson Machine Co., Springfield, Vt.; E. L. Jahncke, president and general manager Jahncke Dry Docks, Inc., New Orleans, La., and assistant secretary of the United States Navy; and Conrad Lauer, vice-president Day & Zimmermann, Inc., Philadelphia.

For the three-year term as manager the following have been nominated: Harold V. Coes, Ford, Bacon & Davis, Inc., New York; J. D. Cunningham, president Republic Flow Meters Co., Chicago; and C. F. Hirschfeld, Detroit Edison Co., Detroit.

Representatives of the society to the American Engineering Council for a two-year term will be L. P. Alford, editor *Manufacturing Industries*, New York; Thomas D. Campbell, president Campbell Farming Corporation, Hardin, Mont.; William B. Ferguson, production manager Newport News Shipbuilding & Dry Dock Co., Newport News, Va.; Charles E. Ferris, dean of engineering University of Tennessee, Knoxville, Tenn.; John L. Harrington, Harrington & Cortelyou, Kansas City, Mo.; William H. Kenerson, chairman division of engineering, Brown University, Providence, R. I.; John H. Lawrence, vice-president Thomas E. Murray, Inc., New York; R. C. Marshall, Jr., Sumner Sollitt Co., Chicago; A. A. Potter, dean of engineering schools at Purdue University, LaFayette, Ind.; and Charles Piez, ex-officio.

Advisory Committee for Distribution Census

An advisory committee of business men and economists which will cooperate with the Department of Commerce in formulating plans for taking the first national census of distribution in 1930 has been announced by Secretary of Commerce Robert P. Lamont, as follows:

F. M. Feiker, managing director, Associated Business Papers, Inc., 52 Vanderbilt Avenue, New York.

Dr. F. M. Surface, assistant director, Bureau of Foreign and Domestic Commerce, Washington.

Sydney Anderson, president, Millers' National Federation, Mills Building, Washington.

Dr. L. D. H. Weld, H. K. McKann Co., 285 Madison Avenue, New York.

Dr. Melvin T. Copeland, professor of marketing, Graduate School of Business Administration, Harvard University, Boston.

W. E. Freeland, Freeland & Warren, Inc., Statler Building, Boston.

E. D. Borden, manager, domestic distribution department, Chamber of Commerce of the United States, Washington.

William Nelson Taft, editor, *Retail Ledger*, Philadelphia.

C. J. Whipple, president, Hibbard, Spencer, Bartlett Co., Chicago.

Henry S. Dennison, president, Dennison Mfg. Co., Framingham, Mass.

E. M. West, Dodd & West, 11 West Forty-second Street, New York.

F. A. Gosnell, Brumback Realty Co., 37 Wilson Boulevard, Clarendon, Va.

Paul T. Cherington, J. Walter Thompson Co., 420 Lexington Avenue, New York.

Herbert P. Sheets, managing director, National Retail Hardware Association, Indianapolis.

The first meeting of the committee will be held Wednesday, July 17, at the Department of Commerce in Washington. Secretary Lamont and Dr. Julius Klein, assistant secretary of commerce, will be present at this meeting, in addition to William M. Steuart, director of the census, and Dr. Robert J. McFall, chief statistician for distribution, under whose immediate supervision the census of distribution will be taken.

It is expected that the scope of this first census of distribution will be determined at the meeting of the committee and that plans will be made for securing the cooperation of the business world. Subcommittees may be named to deal with particular phases of the census.

Scrap Institute to Survey "Direct Dealing"

A thorough survey of every phase of direct dealing between consumers and producers of scrap will be undertaken by the Institute of Scrap Iron and Steel, Inc., it was announced by Benjamin Schwartz, director general, at a meeting on July 10 of the Pittsburgh chapter, at the William Penn Hotel, in Pittsburgh. On the recommendation of Mr. Schwartz, the executive committe of the institute, at its last meeting, made an appropriation, authorizing the creation of a research bureau, the first object of which will be to study the subject of direct dealing.

This study will involve the marshalling of an array of economic facts and evidence by an entire industry. The survey, which will be under the supervision of the director general, will be placed at the disposal of consumers, producers and all agencies concerned with the scrap iron industry. The principle of reciprocity, in the sale of finished steel products and the purchase of scrap, and its effect on the steel industry, will also probably be included.

Abrasive Manufacturers' Export Association

The Durex Abrasives Corporation, an association of manufacturers of abrasive materials, has been organized under the Export Trade Act to export abrasive products. Offices will be maintained at 82 Beaver Street, New York. Officers are A. J. Sidford, president; W. L. McKnight, F. J. Tone and D. W. Fernhout, vice-presidents; R. W. Young, treasurer; and L. K. Southard, secretary.

Members of the association are: American Glue Co., Boston; Armour & Co., Chicago; Baeder Adamson Co., Philadelphia; H. H. Barton & Son Co., Philadelphia; United States Sandpaper Co., Williamsport, Pa.; Behr-Manning Corporation, Troy, N. Y.; Carborundum Co., Niagara Falls, N. Y.; Minnesota Mining & Mfg. Co., St. Paul, Minn.; and Wausau Abrasives Co., Wausau, Wis.

Toncan iron, a rust-resisting product of the Central Alloy Steel Corporation, Massillon, Ohio, has been specified for 1000 all-metal box cars recently placed by the Pennsylvania Railroad. Approximately 5000 tons of this steel will be required.

To Make Stainless Steel in Canadian Plant

Stainless steel will be manufactured by a plant at Shawinigan Falls, Quebec, which is now near completion, Assistant Trade Commissioner L. A. France, Montreal, reports to the Department of Commerce.

When completed the new plant will provide for the manufacture of alloy steel castings of all kinds, including stainless heat-resisting steels, corrosion-resisting steels, wear-resisting steels, carbon steels, specially annealed steels and other alloy steels.

The company owning the new plant will be the first in Canada to specialize in the manufacture of such products. Its equipment will include an electric heat-treating furnace and two electric steel furnaces of 1 ton and 2 tons' capacity.

To Locate New Sheet Mill at Tarentum, Pa.

A new company for the rolling of light-gage steel sheets up to 72 in. in width is being organized in the Pittsburgh district, with a mill to be located at Tarentum, Pa. The plant will be located on the site of the No. 2 factory of the Pittsburgh Plate Glass Co. at Tarentum, which was abandoned in 1914, and the company is to be known as the Tarentum Steel Corporation.

Griffith Robinson, industrial engineer, with offices at 1706 First National Bank Building, Pittsburgh, is active in the organization of the new company and will be its president. William Cole, who was identified with the West Penn Steel Co., Brackenridge, Pa., prior to its consolidation with the Allegheny Steel Co. earlier this year, will be works manager of the Tarentum company. He has been associated with the West Penn company for 20 years and previously was with the Seneca Iron & Steel Co., Buffalo, and the Eastern Rolling Mill Co., Baltimore. Virgil McClay, who has also been identified with the West Penn company for several years, most recently as assistant to the president, will also be associated with the new company.

The Tarentum plant will be equipped with a group of six mills and utilize the double-mill system of manufacture. A number of innovations in sheet rolling will be introduced, particularly relating to the handling of material in process and the saving of man power. The mill will have a capacity of 50,000 tons annually, and will employ from 400 to 500 men.

The capitalization will consist of 60,000 shares of preferred stock with a par value of $50 a share, and 100,000 shares of common with no par value. About half the stock is expected to be sold locally at Tarentum.

Scrap Institute to Apply for Revised Freight Rates

The executive committee of the Institute of Scrap Iron and Steel, Inc., has authorized the filing of a petition with the Interstate Commerce Commission for the examination and reconstruction of the entire freight rate structure in the United States on scrap iron and steel. It is expected that this hearing will be made under the Hoch-Smith resolution, as a result of which the freight structure for finished steel products was recently changed to a mileage basis.

In view of the fact that the decision of the Interstate Commerce Commission on finished steel products did not include scrap iron and steel, the Institute of Scrap Iron and Steel has decided to make a test case, in behalf of the entire industry, for the purpose of eliminating inequalities and broadening markets for scrap.

Sheet Steel Pulley Market Growing Rapidly

Fabricators of sheet steel pulleys have developed a market of fast growing proportions, states the current issue of "Making Markets," published by the Sheet Steel Trade Extension Committee. One of the advantages of these pulleys is their smoothness of groove, which minimizes wear on the belt and makes replacement less frequent.

Requests Amendment of Zinc Ore Tariff

WASHINGTON, July 16.—Stephen S. Tuthill, secretary American Zinc Institute, requested the metals subcommittee of the Senate Finance Committee to amend the zinc ore section of the present tariff act as follows: Zinc bearing ores of all kinds, except pyrites, containing not more than 3 per cent zinc, 1½c. per lb. on the zinc contained therein. The exception protects sulphur in pyrites chiefly used in making sulphuric acid, which in turn is essential to the manufacture of superphosphate, the most widely used farm fertilizer.

A PARK for employees' cars has been provided at the Zanesville, Ohio, plant of the American Rolling Mill Co. An oil and gas station stands at the entrance, giving the attendant control over cars entering or leaving. The station is open from 5 a. m. until midnight, thus covering all three turns of the steel workers. Attendants fix tires and grease cars at a nominal price.

Yale & Towne Mfg. Co. Buys Stuebing-Cowan

The Yale & Towne Mfg. Co., Stamford, Conn., has announced the purchase of the assets and good-will of the Stuebing-Cowan Co., Cincinnati, manufacturer of hand lift trucks. James C. Morgan of the Yale & Towne company will have supervision of the Stuebing-Cowan branch of the business. Walter C. Stuebing will be Mr. Morgan's assistant. William Stuebing will remain as superintendent of the plant in Cincinnati, where a large modern addition is being built to take care of the expanding business.

German Steel Exports Remain High

Although less by 30,594 metric tons, exports of iron and steel products from Germany maintained during May the greater part of the tremendous increase accomplished during April, Trade Commissioner James E. Wallis, Jr., Berlin, reports to the Department of Commerce. Trade totaled 534,825 tons in May, whereas during the preceding month it was 565,419 tons, the decrease amounting to approximately 5½ per cent.

German production increased during May, the output of pig iron rising from 1,105,098 tons in April to 1,133,134 tons in May, with comparable figures for steel at 1,414,916 tons and 1,421,047 tons, respectively. Furnaces in blast at the close of the month totaled 102, an increase of three over the number in operation at the end of April.

Reduction in Fuel Briquet Output in 1928

Fuel briquets produced in the United States in 1928 are reported by the Bureau of Mines at 947,423 net tons, valued at $7,705,617, or an average of $8.13 a ton. This represents a reduction from the figures for 1927 and 1926, but otherwise was the highest, both in quantity and value, ever reported. In 1927 there were 970,468 tons, valued at $7,985,165, or an average of $8.23 a ton; in 1926, 995,332 tons, valued at $8,533,179, or an average of $8.57 a ton.

Production is seasonal—October to January, inclusive, are the four big months, accounting for about one-half the year's total. While 1928 showed a loss of 2.4 per cent from 1927 in aggregate output, the Eastern States reported a gain of 16.3 per cent, being offset by heavy declines elsewhere.

General Electric Orders Gained 32 Per Cent

Orders received by the General Electric Co. for the three months ended June 30 amounted to $119,351,248, compared with $90,431,957 for the corresponding quarter of 1928, an increase of 32 per cent, President Gerard Swope has announced. For the six months ended June 30 orders received amounted to $220,716,456, compared with $170,357,797 for the first six months of last year, an increase of 30 per cent.

Truscon Has New Product

The Truscon Steel Co. has announced the manufacture of a new product, Truscon integral door jambs and trim. It combines door frame, bucks, lintels, jamb, casing, door stop, transom bar and transom casing in one piece which can quickly be erected as an integral part of the wall. Details and specifications of this product are set forth in leaflet No. 159, just published by the company.

More Steel Shipbuilding

A greater tonnage of merchant vessels (mainly steel ships) is now under construction in the United States than at any time for two years, according to Lloyd's Register of Shipping. The total is of 119,098 gross register tons, as of June 30, compared with 96,439 tons on March 31. Not since June 30, 1927, when 147,000 tons was on the ways, has so large a volume been reported. Of the present total, 25,200 tons will be propelled by internal combustion engines, mainly of the Diesel type.

The Long Island Machinery Exchange, dealer in new and used machine tools, has leased building at 12-10 Astoria Avenue, Astoria, Long Island.

Production and Shipment of Raw Materials and Finished Products in June

	June, 1929	May, 1929	June, 1928
Trackwork for tee-rail track (a), net tons..	14,838	16,333	13,716

(d) Thousands of barrels.

Advances to Third Rank in Manufacturing

Illinois is now the third manufacturing State in the Union, with a total value of manufactured products in 1927 amounting to $5,386,003,235, an increase of about $383,000,000 over 1923, when Illinois was fourth in industrial work, says a bulletin issued by the Illinois Manufacturers' Association. Some of the 1927 census figures for Illinois, just made public by the United States Census Bureau, are as follows:

Horsepower employed	2,456,997
Agricultural implements produced	$102,206,815
Brass, bronze and other non-ferrous alloys	34,745,584
Car and general construction and repairs, steam railroad shops	101,340,406
Cars, electric and steam railroad, not built in railroad shops	75,585,816
Copper, tin and sheet iron and steel work	19,555,972
Forgings, iron and steel	18,672,992
Foundry and machine shop products, not otherwise specified	245,148,773
Iron and steel, blast furnaces	70,943,000
Iron and steel, steel works and rolling mills	208,563,956
Motor vehicles, not including motor cycles	35,631,587
Printing and publishing, job and book	167,874,087
Printing and publishing, newspaper and periodicals	169,623,924
Slaughtering and meat packing, wholesale	663,054,316
Smelting and refining, non-precious metals	25,543,803
Smelting and refining, zinc	19,696,455
Steam fittings and steam and hot water apparatus	57,608,342
Structural and ornamental iron and steel work	47,826,604
Tin cans and other tinware	49,416,023
Tools, not including edged tools, machine tools, files and saws	13,022,578
Wrought pipe	14,027,121

Although Illinois continues to hold first place in the production of corn, the State, generally speaking, has changed from an agricultural to a manufacturing State. When first admitted to the Union, nine-tenths of the people were engaged in agricultural pursuits, while now not more than one-tenth are employed on the farms.

The center of electricity production in the United States is at a point 3 miles from Urbana, Ill.

The Apollo Steel Co., Apollo, Pa., is installing a new normalizing furnace and other equipment to replace its present facilities, and which will increase production materially. Early in the year the company considered the construction of open-hearth furnaces adjoining its present plant, but that plan was postponed as a result of an assured supply of semi-finished steel. Other plans affecting the company's output, however, are being contemplated, announcement of which will be made in the near future.

The International Tube Cartel has established a central office in Luxemburg, which operates under the name "Office Statistique des Tuyaux en Fonte," and is popularly known as "Ostef."

This Issue in Brief

Welds duralumin sheet or strip by flanging adjoining edges and making a corrugation parallel to the seam, about 2 in. from the weld. This permits expansion and contraction effects to be absorbed.—Page 158.

* * *

Signs of steel overproduction appearing, says Dr. Haney. Output is no longer well balanced with current requirements, according to statistician.—Page 159.

* * *

Don't blame porosity in cast bronzes on oxides, gas occlusions, or improper mixing, without considering volume change on freezing and the freezing range. Foundrymen will mislead themselves if they leave freezing factor out of their calculations.—Page 164.

* * *

Considerable savings result from use of pulverized coal in open-hearth furnaces, compared with oil, natural gas or city gas, says combustion engineer. Clogging of checkers can be prevented by proper preparation of the fuel.—Page 155.

* * *

Determines carbon content of steel simply and quickly by means of the colorimeter method. Equipment required is inexpensive and the test is easy to make. Sample to be tested is compared with sample of known analysis.—Page 158.

* * *

World War placed France in commanding position as far as iron ore resources are concerned, says economist. France gained by conquest half of the largest of the world's ore fields, and another of almost equal size has been developed on her own soil, so she is now first in ore resources in Europe, and perhaps in the world.—Page 154.

Malleable foundry holding fuel-ratio record for the United States melts 3.8 lb. of iron for each pound of pulverized coal. Further reduction of fuel consumption is expected to result from use of furnace waste gases in operating air heaters.—Page 155.

* * *

Aluminum alloy pistons are used in new Wright Whirlwind engines. Pistons are cross-ribbed on the underside of the head and are fitted with full-floating hollow pins, held in place by expanding spring wire locks, to protect the cylinder walls.—Page 150.

* * *

Heat-treating furnace production records are kept for two years. Card record of each lot heat-treated gives furnace number, specification, truck number, order number, quantity, packer's and furnaceman's names, and total time of heat treatment.—Page 145.

* * *

Sharpest building decline since 1925, says economist. Adjusted index based on floor space was 101.1 for June, says Dr. Haney, as compared with 109.7 in May and 130.6 for June, 1928. Value of contemplated new construction is also lower, and building permits have declined considerably.—Page 159.

* * *

Feeds parts through hardening furnace on a continuous metal belt. Speed is regulated from 5 to 20-min. passage through furnace, depending on the size of the part. At discharge end parts fall through air-tight chute into a quenching tank, on to a conveyor, which carries them into tote boxes resting on a roller conveyor.—Page 145.

Leaky iron castings detected by use of microscope. The two main causes of leaks, porous grain and shrinkage cavities, can be readily observed under the microscope.—Page 147.

* * *

Heat-treating specifications for new parts are furnished by research department of cash register plant. Pyrometer operator, heat-treating department and research department, all are given cards containing the specifications.—Page 145.

* * *

Forward buying in steel greater than anticipated, says economist. Unfilled orders do not reflect falling off in current requirements, Dr. Haney thinks, indicating that buying is in excess of needs.—Page 161.

* * *

Recommends that foundrymen use microscope to detect faults in castings. Not simply a laboratory instrument, says metallurgist. Multiplying the power of the human eye by 100, it enables the foundryman to determine quickly the approximate strength, machinability and other properties of his castings. It also helps him ascertain what caused defects.—Page 146.

* * *

Machine tool purchases for July will run about 20 per cent below June, according to reports. Despite the seasonal recession in buying, it is estimated that current business shows a gain of about 20 per cent over July, 1928. —Page 197.

* * *

Chrome - nickel iron sheets, practically impervious to atmospheric corrosion, are used to cover outdoor corridor bridge. These alloy sheets will withstand severe weather conditions without losing their highly polished finish.—Page 158.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Seven Years of Prosperity

IN less than three months we shall have completed a period of seven years of prosperity. There are definite reasons for fixing Oct. 1, 1922, as the date of beginning. The length is unprecedented. Why has the period been so long, and what does it mean?

There has been so much argument about "prosperity"—recalling the vogue two years or so ago of the expression "profitless prosperity"—that the gage we are here using to determine this period should be stated. We take it that to prosper is to get things which one wants. It will be granted that things produced are received by somebody and that production is confined to things which are wanted. In a succinct manner the Federal Reserve Board has presented monthly statistics since 1919 of "industrial production," including manufacturing and mining, the index numbers being weighted for seasonal variation. The computations are of course made purely on a quantity basis, with no reference to market value. The index of industrial production is therefore an index to "prosperity."

Fittingly the base period selected is the average of 1923-4-5, a very fair standard. Entirely failing to secure a prosperity rating are the years 1919, 1920 and 1921, for they showed only 83, 87 and 67 respectively. In 1922 there was a slow climb to 88 in September, whereupon there was a jump to 94 for October. That is when prosperity began. The month was entitled to be six points below the standard, as an annual increment must be allowed for the growth of the country.

There have been only short lulls in this general period of seven years of prosperity. The first lasted a few months, centering in July, 1924, and political uncertainties were chiefly responsible for it. For the second half of 1927 there was a mild lapse, much less pronounced than that in steel production, which had rather a poor half year.

No previous period of prosperity was anything like so long. After the Civil War came eight years of activity, but there were pronounced bad spells, and when the period ended with the panic of Sept. 19, 1873, it was found that much of the supposed wealth was in uncollectible promissory notes and a good deal of the physical property that had been created could not be employed. Afterward the longest period was the three years ended in October, 1907.

What has been called "true prosperity" has been defined as that which carries within it the means of its perpetuation. There lies the distinction between the older periods and the present one. Many commentators in recent years have referred to what they considered an anomaly, that apparently we had prosperity, but prices did not rise. Whatever goes up must come down. The most important thing a business man then had to know was when to "get on" and when to "get off." To misjudge by a few months was fatal.

With steady prices we have had the prosperity that can perpetuate itself, instead of that which brings about its dissolution. The latter sort was marked by the vicious spiral. Wages and prices rose, an advance in either bringing about a rise in the other. Advances in cruder materials were passed on with increments in more finished products. That was the ascending spiral and then came a corresponding descent. The faster the movement up the sooner it was over.

Things are done so quickly nowadays that if our prosperity had been according to the former fashion we should have had a shortening rather than a lengthening of the old-time period. The present period will end under the accumulated weight of our indiscretions, but the buoying forces promise to be in the ascendant for a considerable time longer.

Servants of the Public

HENRY FORD is now a very different man from him who financed a peace ship during the war, and expressed numerous economic vagaries. Even in his business administration his views have changed. No longer is he trying to manufacture all sorts of articles, and recently he became willing to part with his railroad.

In a recent interview he expressed himself favorably on the "formation of a nation-wide power monopoly as the best means of reducing the rigors of human toil and giving cheap light and power to the people." He asserted that all talk about exploitation by industrial combinations for private profit is of no importance, "the important thing being what the nation as a whole gets as the result of the economic and technical advantages of such combinations."

This evinces good sense. The telephone and telegraph companies, the light and power companies and the public service corporations generally (including the railroads) have given the people many enjoyments. Monopoly by them is the last thing in the world to be feared; for what they want naturally is to increase their business and not to strangle it.

Anyway, these corporations, as well as all other corporations, are mainly owned by the public, who as shareholders in them are reckoned by millions. The politicians who consider it good business for them-

selves to hit a corporation on the head whenever they see it, and who gravely organize investigations of power trusts and other mythical monsters, are behind the times. But politicians are never very good at their own business in a big way, their expertness seldom rising above petty chicane.

The chief differences between the American system of corporate management and the Russian system of state management are that the former is intelligent and efficient, while the latter is just the opposite; and that participation in the fruits of corporate management is reserved for thrifty people, while state control aims to take care of the unthrifty, in which, of course, it fails by virtue of its own ignorance and inefficiency, and consequently absence of means.

The American system makes managers servants of the public. It commands them to improve efficiency, reduce costs for the benefit of the public and surrender in income taxes a large portion of such personal salaries or profits as may accrue to them. It permits them to play golf, and in other ways to enjoy themselves, in order that their efficiency may be increased. In the end there is the inheritance tax as the final leveler.

These servants of the public may sometimes think of themselves as slaves, and may squirm at times. But they have become inoculated with the virus of working for the sake of accomplishment and are seldom able to quit. The myriads of people who live in good houses and have plenty of fuel, food and clothing; who ride around over good roads in 25 million automobiles; who live in well regulated communities, and who have a wide range of intriguing amusements, must agree that the American capitalistic system is better socialism than any the socialists themselves have ever been able to invent, seeing that the main results of the latter have been hunger, cold and general misery.

Human Side of High Productivity

AN analysis of employment in the Worcester, Mass., works of the American Steel & Wire Co., comparing the years 1920 and 1928, shows an extraordinary improvement in two of the most vital factors, labor turnover and absenteeism. In both respects the percentages of 1920 represented large unnecessary production costs. At the North works, for instance, it was necessary in 1920 to hire 2231 men in order to maintain a working force of 2500. Last year only 382 men were hired to maintain a force of 2000, and the actual turnover caused by the drift of workers in and out was reckoned as about 200, the remaining 182 representing the normal and unavoidable changes resulting from death, disability or retirement. Thus, where the turnover in 1920 was nearly 90 per cent, that of 1928 was about 10 per cent.

In the same works in 1920 absenteeism ran between 5 and 6 per cent. In 1928 it was little more than 1 per cent. In the one year 150 employees on an average were away from their tasks, in the other year the number was less than 25. In considering this and similar statistics, some correction should be made because 1920 was a peak year and 1928 only an average year. But at Worcester the first half of 1929, with increased plant activities, has shown little if any change in the attitude of workers toward their jobs. Neither turnover nor absenteeism has increased to an appreciable extent.

Taking up the slack of industrial unemployment, which has been in progress during the first half of 1929, signifies much more in the increase of production than ever before under like general conditions. For the worker's average output is much more than it used to be, partly because he is working more steadily and is not nearly so prone to shift his employment, but in a larger measure because owners have steadily continued the introduction of better equipment and methods. In the Worcester works, for example—and it is typical—it is found that the output of the 4500 men now on the payroll equals that of 1920, when the same plants were operating with over 6000 men.

A like change for the better is to be found in most lines of successful manufacture. As one plant manager who went through the experience has put it, the initial stimulus came in the war, when the urgent, menacing need for munitions gave industry a kick so vigorous that managements were fairly catapulted into action. The pressure for large-scale operation has continued through the intervening years until in many cases production per man-hour has increased to a degree that is nothing short of revolutionary.

Americanizing Industry Abroad

NOW that Ford automobile factories are being opened in Europe, we may expect the extension there of American mass production, whether or not there is emulation of the Ford practice of paying high wages. Obviously the real significance of the Ford colonization is in the extent to which it will implant in Europe the idea of intensive manufacture and the Ford demand for full output from the worker. The system grants wages as high as possible for results obtained. With it, thinking in terms of the buying power of the individual and fostering broad and sustained consumption is basic. When the principle is adopted by numerous industries, the better economic status of the wage earner is a corollary to high mechanization of the plant.

Only a little while ago the first signs of oncoming depression in the United States were commonly met with plans to reduce wages as the first move in getting lower costs. Talk of sustaining buying power by sustaining wages rarely entered into plans for the continued well-being of a given industry. Now the pay envelope is the very last resort in retrenchment, and since the war wage reductions have been almost wholly limited to industries known to be in a bad way.

In Europe on the other hand the old idea still prevails that wages must closely fluctuate with the tides of business volume and this view obtains widely because neither employer nor employee has yet conceived of the wage as dependent upon output. Europe still awaits the outstanding manufacturer who is daring and far-seeing and financially strong enough to put the new doctrine into practice.

Four years ago two talented young Britons, after widely touring the United States, returned home to write the book much read by industrialists on both sides of the water, "The Secret of High Wages."

Their most important conclusions were compressed into these two paragraphs:

> The very life of this country [Great Britain] depends on two things: deliberate adoption by employers of a policy of high wages, and intelligent understanding on the part of the men that every mechanical aid to efficiency must be used to the utmost.
>
> The organization of cheaper production on American lines must be accepted and restrictions on individual output must be swept away.

Our manufacturers would file no caveat against such European imitation of American production methods as is thus forcefully urged upon British industry. They realize that international trade relations would only be bettered were European manufacturers to follow Henry Ford in the effort to increase per capita consumption through efficient production, high wages, high demand, reduced manufacturing costs, lower prices, sustained worker earnings, continued demand—and so repeating around the circle. By that route more can be accomplished for rational competition in world trade and for higher standards of living than by all the protests that can be piled up at Washington against American tariffs, present or proposed.

Large Gain in Alloy Steels

THAT the American alloy steel industry has been making rapid strides is common knowledge. But no such increase in production as took place in 1928 was expected. The American Iron and Steel Institute reports 3,214,909 gross tons of alloy steel ingots and castings for last year, an increase of 683,100 tons or 27 per cent over the output of 1927. The latter year gained but 2.8 per cent over 1926, and in 1926, which was a large steel year, only 1.25 per cent more alloy steel was made than in 1925.

Undoubtedly an important factor in last year's increase was the use of large tonnages of rustless iron by synthetic nitric acid plants. Recent articles in THE IRON AGE have given details. The announcement last week concerning the employment of rustless iron for the roof and trimmings of the new 64-story Chrysler Building in New York points to a considerable development also in construction. The larger consumption in the motor industry is well known, as is that in aviation. It is to be noted that medium-manganese steel —1.00 to 1.75 per cent—is not included in the production figures. Such steel, for rails at least, is not now statistically classified as an alloy steel, though it well might be.

German Study of High-Frequency Steel Furnaces

SYSTEMATIC investigation of the metallurgy of the high-frequency induction furnace has been in progress at the Kaiser Wilhelm Institute für Eisenforschung in Düsseldorf, Germany, since 1926. The main objects of study are discussed in *Stahl und Eisen*, of May 9, 1929, by H. Neuhauss.

Larger Furnace Means Lower Power Per Ton Need

Increasing the size of the furnace results in pronounced decrease in power for melting. Thus, with a furnace of about 100 lb. capacity, between 1250 and 1300 kwhr. per ton are required when melting scrap. By going to the 600-lb. furnace, this figure can be reduced to about 700 kwhr. Indications are that a 1-ton furnace will compare favorably in power consumption with the latest types of arc furnaces.

The present usage in high-frequency melting resembles crucible practice in that no attempt is made to refine the charge, a high quality of raw materials being used. Two plants using this process for high-quality steel are Edgar Allen & Co., Sheffield, England, and the Heppenstall Forge & Knife Co., Pittsburgh.

Advantageous for Low-Carbon Steels

There are, however, several possibilities for refining operations where the "iron-less" induction furnace may be used most efficiently. One of these is the production of low-carbon steels such as Armco iron or Toncan metal. So rapid is the refining action that it is possible to desulphurize in an acid-lined furnace using a lime-fluorspar-ferrosilicon slag. On experimental 120-lb. melts, this slag was left on the bath for 3 min., giving a final sulphur content of 0.010 per cent. This is followed by a thick sand slag with addition of aluminum and manganese. Several minutes are then allowed for the inclusions to be eliminated. Meanwhile re-oxidation is prevented by blowing nitrogen on the slag. The metal is poured without further additions and has the following average analysis:

Carbon—0.02 per cent.
Manganese—0.04 to 0.10 per cent.
Silicon—0.1 to 0.3 per cent.
Sulphur—0.01 per cent.
Aluminum—Trace.

It is not in the least red-short and can be rolled into perfect seamless tubes. Such materials, due to extreme freedom from inclusions, would be exceptionally resistant to corrosion.

Duplexing With the Cupola

Another possibility is a combination with a cupola melting steel scrap and charging liquid pig iron into the induction furnace. Since the carbon content of the liquid iron can be rapidly lowered in the induction furnace, a means is offered whereby gray iron plants could produce simultaneously small steel castings. Experimentally 12 lb. of pig iron (3.25 per cent carbon) have been decarburized (to 0.04 per cent carbon) in 18 min. by means of a stream of hot air directed on the bath. The duplex process may also be useful in regions where no iron is produced, but where scrap is available.

Perhaps of more direct interest is the use of the induction furnace in making stainless steels. The following methods have been used:

> Alloying low-carbon steel with low-carbon ferrochrome.
>
> Decarburizing high-carbon ferrochrome in the induction furnace and adding to fluid low-carbon steel.
>
> Alloying low-carbon steel with cheap, high-carbon ferrochrome and decarburizing the melt.
>
> Production of a 15 per cent Cr pig iron in the induction furnace directly from chrome and iron ores, and decarburizing this iron to give a low-carbon stainless chrome-iron.

In decarburizing the chrome-iron alloys, the high-frequency furnace seems to offer definite advantages. Among these are the ability to reach a very high temperature, thus preventing loss of chromium, and the constant stirring action which results in very rapid refining.

To Use Rustless Iron in Chrysler Building

What appears to be first use on a large scale of rustless iron in building construction is noted in the case of the new Chrysler Building at Forty-second Street and Lexington Avenue, New York. There are several types of rustless iron sold under different trade names, but in general it is a low-carbon, alloy steel containing either a high percentage of chromium or a high percentage of chromium and nickel. The particular brand to be used in this building is stated to be Nirosta, which contains about 18 per cent chromium and 8 per cent nickel, with a carbon content of 0.10 per cent or less. The companies producing this material include Central Alloy Steel Corporation, Crucible Steel Co. of America, and the Ludlum Steel Co.

Rustless iron is to be incorporated in the dome of the building. The height of the dome itself is equivalent to about five stories. On several floors the doors and trimmings are to be made of rustless iron and it is pointed out that this is eminently suitable for this use because it can be given a velvety finish. On the outside of the building all the louvers, or ventilators, are to be made of this same rust-resisting material.

The metallurgists of the companies making this particular brand of rustless iron have cooperated with the metallurgists of the research laboratory of the Chrysler Motor Corporation in the selection of forms and finishes in which the rustless iron is to be used.

Metal Roofdecks Are Stocked in Detroit Warehouses

The Gemfire Steel Co. and the Truscon Steel Co., Youngstown, Ohio, have begun stocking sections of Armco ingot iron roofs in standardized lengths of 19½ ft. in Detroit warehouses to serve users in adjacent territory quickly. The roofdecks come in narrow sections which can be used in any desired lengths. Other warehouse stocks of metal roofdecks will be established by these companies in large cities throughout the country.

Oil Burner Company Makes Changes

Leod D. Becker, owner and publisher of *Fuel Oil Journal*, and a pioneer in the oil burner industry, having disposed of his publishing interests, has been elected president of Electrol, Inc., St. Louis, manufacturer of oil burners. Executive and sales offices will be moved to 227 East Forty-fifth Street, New York. W. T. Koken, who has been president of Electrol since 1925, becomes chairman of the board. M. E. Simpson, formerly general manager of the Electrol Distributing Corporation, which has been merged with Electrol, becomes vice-president in charge of sales. Lionel L. Jacobs continues as vice-president and general manager of the company. Han A. Kunitz, formerly technologist of the American Oil Burner Association, has been appointed chief of research engineering. Lewis L. Scott, inventor of the original Electrol burner, who is a vice-president, continues as general consultant on patents and engineering. The officers, with W. L. Bechtold, of G. H. Walker & Co., St. Louis investment bankers, and W. R. Bush, New York, constitute the directorate.

Manganese Ore Output Small in 1928

There has been little change in the rate of production and shipments of manganese ore, containing 35 per cent and more of manganese, in the United States, in the past three years, according to the United States Bureau of Mines. In 1928, 46,636 gross tons, valued at $1,212,679, was shipped, compared with 44,741 tons, valued at $1,151,918 in 1927, and 46,258 tons, valued at $1,228,663, in 1926. In 1928, 15,430 tons was chemical ore and 31,206 tons, metallurgical ore, compared with 17,011 tons of chemical ore and 27,730 tons of metallurgical ore in 1927, and with 19,728 tons of chemical ore and 26,530 tons of metallurgical ore in 1926.

It will be noted that there has been a falling off of approximately 2000 tons a year in the shipments of chemical ore during this period, which is a continuation of the decline from the peak of shipments, 24,637 tons in 1924. Shipments of metallurgical ore were 3500 and 4700 tons higher, respectively, than the shipments in 1927 and 1926.

Shipments of metallurgical ore from Montana were 12,044 tons in 1928, compared with 10,124 tons in 1927. The plant owned by the Domestic Manganese & Development Co. was put into operation during March and treated rhodochrosite from the Emma mine at Butte, Mont., operated by the Anaconda Copper Mining Co. It produced 11,118 tons of calcined and nodulized material containing 56.45 per cent of manganese. In 1927 the larger part of the metallurgical ore shipped from Montana was from mines at Philipsburg. High-grade shipments from New Mexico and Virginia increased somewhat and those from Nevada dropped off entirely.

Imports of manganese ore in 1928 totaled 427,708 tons, containing 207,808 tons of manganese, and valued at $5,395,949, compared with 622,067 tons, containing 308,630 tons of manganese, and valued at $8,487,016. There were large decreases in imports from all of the important producing countries.

Domestic shipments of ferromanganese in 1928 were 310,122 tons, the largest on record, with the exception of those for 1926, and indicated a consumption of approximately 620,000 tons of manganese ore. The domestic production of manganese ore has changed little in the past three years. Assuming that the metallurgical manganese ore produced in the United States in 1928 offset the ore imported for chemical uses, the total quantity of ore imported, 428,000 tons, was available for consumption in the manufacture of ferromanganese. This tonnage is 192,000 tons less than that required by the manufacturers of ferromanganese in 1928. The difference is explained largely by the decrease in stocks in bonded warehouse, officially reported as 183,477 tons of manganese content on December 31, 1927, and 114,497 tons on December 31, 1928, a difference of 68,980 tons of manganese content, equivalent to at least 138,000 tons of ore. The remainder of the ore required, approximately 55,000 tons, may have been taken from stocks at the plants of consuming companies.

British Foreign Trade in Iron and Steel Products

(In Gross Tons)

Item	Imports May	Imports June	Exports May	Exports June
Pig iron and ferroalloys	7,637	11,376	68,141	40,884
Ingots, blooms, billets and slabs	97,244	85,670	2,615	1,395
Iron bars, rods, angles	17,442	15,358	3,293	1,932
Steel bars, rods, angles	46,182	41,205	29,934	22,522
Structural steel	9,417	9,614	6,119	5,254

Iron and Steel Markets

Deliveries Easier on Some Products

Common Sheets and Cold-Rolled Strip in Supply at Slight Price Concessions—Two Gas Lines Will Take 440,000 Tons of Pipe—Southern Pig Iron Weaker

NEW projects that will take large tonnages of steel continue to come into the market, offsetting the slight falling off in consumption in some manufacturing lines.

Gas pipe lines, building construction and railroad requirements figure prominently in actual and prospective business.

Evidence also of a stepping up in demands from the automobile industry comes in the form of requests for increased shipments to begin Aug. 1 from companies which had cut schedules preparatory to bringing out new models.

Farm machinery manufacturers, in estimating their steel requirements for the next three months, are planning for a high rate of output. Manufacturers of steam shovels and other road-building equipment are taking steel in undiminished quantities.

Notwithstanding the reduced volume of buying of some steel products, notably cold-rolled strip and some grades of sheets, on which production has caught up with the demand, the steel industry as a whole has felt no marked curtailment in general consumption.

The United States Steel Corporation subsidiaries are working virtually at capacity, and this is true also of most of the independent companies. Taking into account the slight losses in output due to heat and shutdowns for necessary repairs to equipment, present production is probably not five points below the 99 per cent operating rate of recent months.

The small loss in the unfilled tonnage of the Steel Corporation, as of June 30, gave evidence of the fact that the volume of buying last month kept close to the heavy shipments. The June decrease of 47,257 tons was less than one day's output.

Lessening of the extreme pressure for some lines of steel, while not materially reducing the total output, has made it easier for steel companies to arrange mill schedules, and better deliveries to consumers have resulted. A further effect is the relieving of the scarcity of semi-finished steel, which is now adequate to meet the needs, although mills have had little opportunity to replenish the reserves which have been used up in recent months.

Gas pipe lines, which so far this year have taken about 600,000 tons of steel, will provide further large orders. The line from the Texas Panhandle to Chicago, to be built by the Central States Natural Gas Co., requires 191,000 tons, most of which the Milwaukee fabricator of electrically welded pipe is expected to furnish. Another gas line from the Southwest into the Chicago district for Henry L. Doherty & Co., New York, calls for 250,000 tons, soon to be awarded. A group of public utility companies has been formed to lay a total of probably 1000 miles of pipe lines into Pennsylvania, New Jersey and New York.

In steel building construction fresh projects call for more than 74,000 tons, the largest amount reported in any one week this year. Included are 15,000 tons for a bridge at McKees Rocks, Pa., 18,000 tons for two buildings in Chicago and 8300 tons for subways in New York. Awards amounted to 26,000 tons. In Chicago, 40,000 tons of structural steel work is soon to be placed, not figuring the large tonnages for the mill buildings to be erected by the Illinois Steel Co.

Railroad buying has been chiefly in track material. The Great Northern bought 30,000 tons of rails and its orders for accessories will amount to 10,000 tons. The Northern Pacific and the Pennsylvania roads are expected to take 15,000 tons of rails each, and the latter will also buy 5000 tons of track supplies. The Norfolk & Western, following its orders for 39,000 tons of rails, will need 3500 tons of track supplies. Railroad buying of bridges and repair material has also been fairly large.

In the lines of steel in which buying has let down slight price weakness has developed. This has taken the form chiefly of giving the minimum quotations to a larger circle of buyers. Blue annealed sheets have now been affected along with black and galvanized, but full finished and specialty sheets are well sold up and quotations remain steady. Some makers of cold-rolled strip steel need orders, which are being freely taken at 2.75c., Pittsburgh, the premium of $2 a ton for small lots being waived in instances.

Active third-quarter buying has failed to develop in pig iron. Aggressive selling by Southern furnaces, which have heavy stocks of iron, has made Northern buyers more cautious. A few large sales of Southern iron have been made at $14, Birmingham, notably one of 15,000 tons to a Louisville melter. Southern basic iron has been offered at $13.50, furnace. Northern pig iron prices remain steady except in New England, where competition not directly attributable to the Southern situation has caused some unsettlement. Jackson County silvery iron has declined $1 a ton.

THE IRON AGE composite price of finished steel remains unchanged at 2.412c. a lb. for the sixteenth week, while the pig iron composite has dropped for the third time in six weeks, and is now $18.42, a decline from $18.54 last week. The year's high was $18.71 in May.

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Production Held Close to Full Capacity—Some Slight Declines in Demand With Little Price Weakness

PITTSBURGH, July 16.—With July half gone, Pittsburgh district steel makers have yet to feel any marked curtailment in the general demand for their products. Specifications on some lines have declined much more rapidly than production during the last two weeks, but a leading maker of sheets reports the heaviest specifications since early April and tonnage releases on plates, wire and pipe are fully equal to performance during the corresponding period of June.

Hot weather is now the principal factor in the curtailment of operations, although occasional interruptions are required for repairs to overworked equipment. The larger companies in this and nearby districts are still operating at close to physical capacity, but the actual production of steel is probably 5 points below the peak rate of the spring months. Producers hesitate to curtail in their blast furnace or coke oven departments, and there is a growing belief in the market that the full resources of the industry will again be taxed by heavy fall demand.

Increased August specifications from the automobile industry, although not widely scattered enough to be considered general, indicate a renewed call for steel from that consuming channel. Large pipe line projects are being figured and the oil industry seems to be showing slightly more interest in drilling materials as well as tankage facilities. Barge buying, while temporarily dormant, promises to be renewed as soon as builders have lessened present heavy commitments.

In the immediate Pittsburgh district extensive highway and bridge construction is taking heavy steel tonnage and a bridge across the Ohio River, for which plans are being prepared, will require about 15,000 tons of structural shapes. Railroad car builders in this district will be busy for several months on present work and have shared in recent orders.

Tin plate demand seems to have passed the doubtful status of 30 days ago and recent specifications have been generally satisfactory.

The steel price structure has reflected little weakness as demand for some products has declined slightly. On semi-finished steel, ruling quotations are somewhat in doubt, because of the hesitancy of large consumers to pay the advance on billets and slabs which mills are asking over second-quarter contract prices. Weakness in wire nail prices in nearby districts has not been carried into the Pittsburgh area, and occasionally reported concessions on steel bars and cold-rolled strip have not reached recognizable proportions. Softness continues in galvanized sheets, but many large mills are so well supplied with tonnage that they are not forced to compete for low-priced business in order to maintain satisfactory operations.

Active future buying has failed to develop in the pig iron market, but shipments are holding up fairly well and there is considerable small-lot purchasing at full quoted prices. A stronger undertone continues in scrap despite the absence of large purchases by the mills.

Pig Iron.—A large tonnage of third-quarter iron remains to be bought in this and the Valley districts, although a number of users, particularly of the basic grade, have quietly closed on their immediate requirements. The market is lacking in large inquiries, no new ones having been reported since last week. The Westinghouse Electric & Mfg. Co. has yet to close against the requirements of its Trafford City, Pa., plant. Shipments are holding up fairly well and there is a steady run of new buying in one and two carload lots. In such transactions the regularly quoted prices are being strictly adhered to, and under present conditions no immediate weakening seems likely. The Claire furnace at Sharpsville, Pa., is expected to go out for relining and repairs within a short time, leaving only four strictly merchant stacks operating in the Valley. This is a reduction of two furnaces since spring, and the blowing in of the Neville Island Furnace in the Pittsburgh district will only partly offset the resultant reduction in available merchant tonnage. Merchant furnace stocks are very low, and with one Valley furnace sold up until October, the present market situation seems to favor the sellers. Steel company stocks are also low and steel operations in the Pittsburgh and Valley districts leave little for outside sales. Freight rates prevent the entrance of Southern iron into this and the Valley districts, but considerable interest was aroused by the recent purchase of 15,000 tons of Southern foundry iron by a Louisville, Ky., sanitary ware maker at $14, Birmingham.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—The supply of semi-finished steel in this and nearby districts is now entirely adequate to meet local demand, but non-integrated companies report occasional difficulty in securing tonnages in addition to the regular allotments. Mills have had little opportunity to build up reserve supplies of crude steel and the close adjustment of supply to demand was well illustrated during the Fourth of July week, when curtailment of open-hearth production forced many companies to cut down the operating rates of their finishing mills. In many cases open-hearth furnaces are down for repairs from time to time, and, although steel production in the district may still be said to be close to physical capacity, the actual rate is considerably below that of earlier months. Prices are still rather unsettled, notably on billets and slabs. Sheet bar contracts for this quarter have generally been closed at $35 Pittsburgh or Youngstown, and several companies are quoting this price on spot business. Others, however, with little tonnage for sale, are asking $36. Rerolling billets have not been widely sold at $35, and several large consumers are holding out for a lower price. The same situation applies to slabs, while forging billets are now well established at $40 a ton. On wire rods, the $42 price is holding and contract tonnage has been regularly covered at that figure.

Bars, Shapes and Plates.—Specifications are lagging slightly as compared to June, but do not suggest a summer slump of any marked proportions. On plates, neither shipments nor specifications have declined materially, and delivery promises still are from four to six weeks. Falling off in bar tonnage is attributed partly to the lesser requirements of the cold-finished makers, who are not operating at as high a rate as recently. In general, bar business is fairly well distributed, with reinforcing steel rather active. A large boulevard project in the district will require about 2100 tons of reinforcing bars and a bridge across the Ohio River at McKees Rocks will take 900 tons for approaches. The superstructure of this bridge, which will require about 15,000 tons of structural steel, will not come up for bids for several weeks. Structural awards in this district are not running into much tonnage, but a considerable amount of work is in prospect and local fabricators look for renewed activity in the late summer. A report that the Inland Waterways Corporation would soon take bids on 18 additional barges is unconfirmed, although this inquiry is expected in the fall. Barge business is not active, but builders are so well supplied with work that there is no anxiety for new orders. Prices are fairly well maintained, at least in the immediate Pittsburgh district. The 1.95c. Pittsburgh price on plates has never been better established, and occasional shading of this figure on bars usually takes the form of the same quotation on a Cleveland base. Prices on fabricated structural steel are feeling the depressing effects of keen competition, but concessions from the 1.95c., Pittsburgh, price on shapes are not common.

Rails and Track Supplies.—The Norfolk and Western is said to have closed against its recent inquiry for 39,000 tons of rails, but this road's inquiry for 3500 tons of tie plates and accessories still is pending. Other business in track accessories is confined largely to small lots. July business is somewhat behind that of June. Demand for light rails is almost entirely lacking, and some makers of light rails from billets have been forced to meet the competition of rerolled material, representing a concession of $2 a ton from the quoted price of $36, Pittsburgh mill.

Wire Products.—Conflicting reports as to the demand for manufacturers' wire indicate that business is not well distributed, although aggregate specifications seem to be holding well up to the June level. Jobber purchases have declined, but the movement into this channel is above the usual summer average. Prices on plain wire seem to be well established at 2.50c. to 2.60c., Pittsburgh or Cleveland. On nails, price weakness persists in competitive districts to the West and South, but sales at less than $2.65, base, per keg, in the immediate Pittsburgh territory, have not been reported.

Tubular Goods.—Considerable inter-

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅝ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plates, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2½ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

est is centered in line pipe projects. Mills are fairly well supplied with business in the larger sizes of pipe, and the promise of some heavy lettings in the fall, if fulfilled, will provide a satisfactory year's business. Oil country material is moving steadily, but not in large proportions. Business in mechanical tubing has failed to show any marked recession from recent levels.

Sheets.—One large maker reports its specifications last week as the best since early in April, and the industry as a whole seems to be continuing the high pace set earlier in the year. Operations last week were seriously curtailed by the hot weather, and all of the larger mills are still much more concerned in making deliveries than they are in new business. Only the common finishes of black sheets and occasionally galvanized material can be obtained in less than three or four weeks, and makers of blue annealed sheets and light plates hesitate to promise shipment before Sept. 1. This situation holds true to a lesser extent on automobile body and metal furniture sheets, the former as a result of heavy August specifications by several automobile makers. These tonnage releases also indicate a renewed demand from that source early in the fall. The price situation in sheets shows little change, with the principal weakness in the galvanized product. Concessions from the 3.60c., Pittsburgh, price to jobbers persist, but are not recognized as the market by leading makers, who are taking business at 3.60 and 3.70c. On black sheets, the market is quotable at 2.85c. to 2.95c., Pittsburgh, the lower figure applying only to very large buyers, principally in the automotive field.

Tin Plate.—Prospects are better than they were a month ago, and although mills are being operated largely on a week-to-week business, there is nothing to indicate any marked falling off in specifications during the summer. September tonnages of the leading container manufacturers, which are ordinarily specified prior to July 15, are up to expectations. Crop information is more encouraging, and only an unforeseen curtailment of demand in the closing months of the year will prevent the total tonnage from equaling last year's record production. Operations in the Pittsburgh district average 90 to 95 per cent of capacity.

Strip Steel.—The strip market is rather quiet, with specifications not far behind the June levels, but with mills having little difficulty in making deliveries on either the hot or cold-rolled material. Business is not so well diversified as might be desired. Shipments to the automobile industry are considerably below peak levels. Cold-rolled strip is quotable at 2.75c. to 2.85c., Pittsburgh or Cleveland, although the higher figure is now applying on little tonnage. The market on hot-rolled strip is well established at 1.90c. and 2c., depending upon the width.

Cold-Finished Steel Bars.—This market has again become established on the hand-to-mouth basis which usually applies in the case of normal demand. Specifications are holding up rather steadily for this time of the year and compare favorably with June business. Changes in extras, which have been in preparation for some time, are expected to be announced in a short time. The base price is unchanged at 2.30c., Pittsburgh.

Coal and Coke.—Furnace coke is more plentiful in the face of light demand, but operators hesitate to curtail production materially on account of an expected improvement in the near future. The H. C. Frick company is still operating about 3100 ovens in the Connellsville district, but most of the plants are being run on a five-day week basis. The market is quotable at unchanged prices, or $2.75 to $2.85 per net ton, Connellsville. Shipments of foundry coke are light, but demand is not below normal for this time of the year. Price weakness is confined to the less desirable grades.

Old Material.—A small sale of No. 1 heavy melting steel at $19 during the last week seems to give the market added strength. However, there has been little large buying by the mills, and the average price for No. 1 scrap seems to have changed little from $18.50, as quoted last week. In view of scattered sales at varied prices, a wider range on prices is needed to show the market fairly. The sale of a part of the recent Pennsylvania Railroad list to a mill in this district at close to $19.50 also bears out the strength of the market, as this steel ordinarily commands a premium of 50c. a ton over average No. 1 steel. In the absence of sizable transactions, compressed sheet steel is unchanged at recent levels, while heavy breakable cast has been advanced 50c. a ton on a recent transaction. The market is rather tight so far as buying by dealers is concerned, and purchases of heavy melting steel are reported at less than $18, as well as at more than $18.50. With steel operations extraordinarily high for this time of the year, sentiment in the scrap market is inclined to be of a bullish nature, although other dealers are inclined to view with caution the rather frequent rejections at many points and a hold-up at at least one large consuming center.

Prices per gross ton delivered consumers' yards in Pittsburgh and points taking the Pittsburgh district freight rate:

Basic Open-Hearth Grades:	
No. 1 heavy melting steel	$18.00 to $19.00
No. 2 heavy melting steel	16.00 to 16.50
Scrap rails	17.50 to 18.00
Compressed sheet steel	18.00 to 18.50
Bundled sheets, sides and ends	16.50 to 17.00
Cast iron carwheels	16.00 to 16.50
Sheet bar crops, ordinary	19.00 to 19.50
Heavy breakable cast	13.00 to 13.50
No. 2 railroad wrought	18.25 to 18.75
Hvy. steel axle turnings	16.00 to 16.50
Machine shop turnings	11.50 to 12.00
Acid Open-Hearth Grades:	
Railr. knuckles and couplers	21.50 to 22.00
Railr. coil and leaf springs	21.50 to 22.00
Rolled steel wheels	21.50 to 22.00
Low phos. billet and bloom ends	22.00 to 22.50
Low phos., mill plates	22.00 to 22.50
Low phos., light grades	20.00 to 20.50
Low phos., sheet bar crops	20.00 to 21.00
Heavy steel axle turnings	16.00 to 16.50
Electric Furnace Grades:	
Low phos., punchings	19.50 to 20.50
Hvy. steel axle turnings	16.00 to 16.50
Blast Furnace Grades:	
Short shoveling steel turnings	12.00 to 12.50
Short mixed borings and turnings	12.00 to 12.50
Cast iron borings	12.00 to 12.50
Rolling Mill Grades:	
Steel car axles	21.50 to 22.00
Cupola Grades:	
No. 1 cast	15.00 to 16.00
Rails 3 ft. and under	20.00 to 21.00

Wire, galv. soft, base per 100 lb.	3.00 to 3.10
Common wire nails, per keg	3.00
Cement coated nails, per keg	3.05

Productive Activity Sets Another Record

Manufacturing operations are believed to have made another high record in June, based on their consumption of electrical energy, according to *Electrical World.* While the index declined from 136.9 in May to 135.2 in June, seasonal correction, it is thought, would show a new high mark. There was a heavy falling off in the metal industries group, which dropped to 147.9 from 154.8 in May. Of the two components, rolling mills and steel plants, dropping from 172.2 to 154.3, showed the heavier loss. Other metal-working plants, ferrous and non-ferrous, declined to 143.4 from 144.2 in May.

Automobiles, including parts makers, dropped from 161.8 to 154. Gains were recorded in leather, forest products, paper and pulp, rubber, chemicals and allied products and stone, clay and glass.

The American electric rotary clay gun will be provided for one of the leading blast furnaces in England by the William M. Bailey Co., Pittsburgh.

Chicago

Automobile and Farm Implement Industries Taking Steel in Larger Quantities After Letdown

CHICAGO, July 16.—Among the noteworthy developments in this market are strong indications of greater consumption of steel by the automobile industry and by manufacturers of farm equipment. A week ago automobile parts makers started heavier production and now several large automobile builders have asked for heavier shipments to commence before Aug. 1. On the whole, the local steel market is firm.

Lessening in the strain on supplies of semi-finished steel is of distinct advantage to integrated mills, which now find rolling schedules easier to arrange and so are able to give better deliveries both as to time and variety of steel products.

New sales for the week were not large, but this is not surprising in view of the heavy purchases in the preceding 15 days. Specifications are steady at the average so far this year, and local steel mills continue to produce at capacity.

The Great Northern has placed 30,000 tons of rails, about 18,000 tons of which will be rolled by Chicago mills. Another Northwestern railroad will take 15,000 tons and a like tonnage is expected from the Pennsylvania. Western rail mills are well scheduled through August.

Several pipe line projects, including two lines from the Southwest to Chicago which will take nearly 440,000 tons of steel, and a 20-mile gas line in Kansas, are taking shape. Close to 40,000 tons of new building projects, not including steel mill additions, are in sight in the immediate Chicago district.

Pig Iron.—Northern iron is holding firm at $20 a ton, local furnace, and buying for the current quarter and last half is active. Prices for Southern iron, which is reaching Chicago and northern Illinois, are wavering. Nominally the market is at $14.50 a ton, Birmingham, but $14 is freely done and concessions are reported below this last figure. Some sellers are taking orders for later billings with prices to be adjusted at the time of shipments in accordance with the market at that time. One order of this kind was for 500 tons. A more or less common way of doing business in Southern iron is to put low offers up to furnaces. It is reported most of these are accepted. Sales in northern Indiana and western Michigan are heavy, the aggregate for the week being near 7000 tons. Two thousand tons of Southern basic, sold to replace scrap at St. Louis, has been taken at a low figure.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.51 to 20.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—Demand for this commodity continues high from most consumers in the West. Manufacture of pipe is taking large tonnages, and tank makers in this and nearby territories are engaged at close to capacity. Car builders appear to be handicapped in their desire to increase output by the scarcity of skilled labor. Specifications from this source are heavy. New car orders are lacking, and there is further indication that the bulk of steel needed for old car business already has been ordered from mills. Several weeks ago a mill to the south of Chicago had received its last specification from car shops, and now one Chicago producer finds that releases for 4000 tons will complete its present obligations. Deliveries of plates are somewhat improved, being now in the range of six to eight weeks. This situation is tending to check the flow of new business from Western consumers to Eastern producers, but the total volume of plates placed to the east of Chicago was large and shipments coming to local consumers will be heavy for some time to come.

Structural Material. — Although there still is complaint that building permits in the Chicago area are low for this time of the year, it is quite apparent that the drop is less noticeable in the steel frame type of structure than it is in other kinds of building construction. Awards in the past week have been scattered and not of impressive size when considered individually. However, in gaging this situation it should be remembered that in recent months a number of extra large tonnages have been awarded and that much of that tonnage is still going through local shops. Steel mill expansion alone is engaging a fair part of local shop capacity, and the announcement by the Illinois Steel Co. that it will add materially to its South and Gary works forecasts the use of large tonnages for that purpose. A permit has been issued for the Cuneo Tower Building, noted a week ago, which will take close to 8000 tons. A theater and office building project for Wacker Drive, Chicago, will take 12,000 tons. All told, the pending list of steel structures is impressive. Shops at Milwaukee are busy, but in Indiana most fabricators are in need of additional work.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.

No. 8 black ann'l'd wire, per 100 lb.	$3.45
Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

Ferroalloys.—The market for spiegeleisen is quiet in new orders, but shipments are steady. Ferromanganese is quoted at $105 a ton, seaboard, but no sales are reported.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Sheets.—Consumers of this commodity are for the most part busy and are entering liberal specifications. Releases are fully equal to shipments, which represent 85 per cent of hot mill capacity. New buying, though steady, is for the most part for nearby needs. Prices in the local market are firm, but light gage sheets, such as used by the roofing trade, are weak when for delivery in the Southeast and Southwest. Locker makers are busy and have substantial orders. Light tank manufacturers find their books growing, and they are releasing larger tonnages to the mills.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—This market remains dull in both private and public buying. Car lot purchases, like large tonnages, are scarce, though prices remain steady at $37 to $38 a ton, Birmingham, for diameters 6 in. and larger. West Allis, Wis., is said to have ordered 32,000 ft. of 24-in. pipe from the United States Pipe & Foundry Co. Among new inquiries are 1668 tons of 3 to 12-in. Class B pipe for Chicago and 100 tons for a filtration plant at Popular Bluffs, Mo.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Bars.—This has been another good week from the viewpoint of specifications for mild steel bars. Releases are fully equal to shipments, which are at the capacity of local bar mills. Sales in the past seven days have been light, but this was not unexpected, since the bulk of third quarter contracts had been closed by the end of the second week in July. Of special interest is the fact that many users sought to cover for all of the last half, a move that seldom occurs at this time of the year. Automobile acces-

sory manufacturers are arranging schedules for the next two months. It is quite evident, as judged by their estimates of steel needs, that they are looking forward to the near future with optimism. Farm implement makers are encouraged as to the outlook both in the summer months and for the fall trade. This is reflected in their attitude toward the estimates of the steel they will need in the next three months. Shipments of alloy steel bars are steady at 85 per cent of local mill capacity. Deliveries range from three to four weeks. Specifications do not bulk as large as in either the first or second week of July. With the Moline mill again in operation, all rail steel bar units in this district are producing. Prices are firm at 1.95c. a lb., local mill, and deliveries range from three to four weeks. Specifications are fully equal to output. New buying, both for future and immediate needs, is quiet.

Bolts, Nuts and Rivets.—Demand for these commodities is easier from the railroads, but heavier from manufacturers of farm equipment. The net result is that shipments are about steady and output remains at 65 per cent of capacity. Stocks in the hands of producers are low.

Reinforcing Bars.—Pending projects, though in large volume, are moving slowly, and not an impressive amount of new business is coming before the trade. Stagnation of the market is adding to the weakness of prices, which, at 2.10c. to 2.40c. a lb., warehouse, for billet steel reinforcing bars and 1.90c. to 2.05c. for the rail steel commodity, have been wavering in recent weeks. Thorgesen & Erickson have been awarded the general contract for track elevation by the Chicago, Milwaukee, St. Paul & Pacific. This project will require 800 tons of bars. Bids will be opened July 15 on the 1200 tons needed by the Jewel Tea Co., Barrington, Ill.

Old Material.—This summer's scrap market is unusually steady because of heavy and uniform consumption by most users. Demand is holding prices at a higher relative level than in previous years. Week to week fluctuations are almost negligible. Supplies of the heavy tonnage grades are ample, but consumption is high and there appears to be little opportunity for yards to accumulate scrap in anticipation of heavier demand in the fall months. On this score, there is general accord among sellers that present quotations will hold moderately well in the coming weeks and that renewed buying, which is expected in September, will result in stronger prices. Sellers are working hard to cover their short positions in the market. One steel mill, which a week ago cut shipments of heavy melting steel, is again taking normal tonnages. A recent railroad offering of this grade brought $15.10 a gross ton, delivered, but odd cars are quickly being taken out of the market at as high as $15.30 a ton. Shipments of cast iron borings to blast furnaces are curtailed while one merchant stack is being relined. The supply of this grade is free, and brokers are paying $9.75 to $10.25 a gross ton, delivered, against old orders. Hydraulic bundles are being produced faster than consumers will take them. The best offer made by a mill in recent weeks is $13 a gross ton, delivered. The cast iron wheel market is quiet both in shipments and sales.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$14.75 to $15.25
Shoveling steel	14.75 to 15.25
Frogs, switches and guards, cut apart, and misc. rails	16.25 to 16.75
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.00 to 13.50
Forg'd cast and r'l'd steel carwheels	18.25 to 18.75
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.75 to 17.25
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	9.75 to 10.25
Short shoveling turnings	9.75 to 10.25
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.75 to 17.25
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Wire Products.—Demand for wire and wire products continues to taper, and mill output has been cut to 65 per cent of capacity. Jobbers are finding business rather spotty, but better than a year ago. The jobbing trade got under way late in the spring, with the result that the early summer demand has been better than usual. Use of nails is light, and competition, especially in the Southwest and Southeast, is unusually keen. The price situation in this commodity is unchanged. Quotations in and near Chicago are moderately steady, while in outlying districts price cutting is in evidence. Stocks in the hands of jobbers are of small size, but mill deliveries are prompt in wide assortments and the trade is not experiencing trouble in obtaining ample supplies on short notice. Specifications from the manufacturing trade show a slight decline.

Rails and Track Supplies.—The Great Northern has ordered 30,000 tons of standard-section rails. The Illinois Steel Co. was given an order for 13,000 tons, Inland Steel Co. 5000 tons, and Bethlehem will furnish 12,000 tons. About 30,000 tons of rails will soon come into the market, according to the estimates of local producers. The Northern Pacific is expected to take 15,000 tons, and it is probable that the Pennsylvania may order a like tonnage. Track orders aggregate 3000 tons. Pending tonnage is not less than 15,000 tons, of which 10,000 tons is for the Great Northern and the Northern Pacific and 5000 tons for the Pennsylvania. The light rail market is listless.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Coke.—Prices for by-product foundry coke are steady at $8 a ton, local ovens. Spot buying is dull, but specifications against past obligations are heavy, and the shipping rate in July is close to the average in June.

More Steel Ties to Be Used on British Railroads

Further purchasing of railroad steel ties, following that of the Southern Railway (British) earlier in the year, is reported by Commercial Attaché William L. Cooper, London, to the Department of Commerce. The London, Midland & Scottish Railway has placed an order with the United Steel Companies, Ltd., for between 500 and 600 tons of pressed steel railway sleepers of the Sandberg heavy type. The London & North-Eastern Railway has placed a similar order of 500 tons.

To Merge Nipple Plants

Stockholders of the H. C. Atkins Mfg. Co., St. Louis, have voted to increase the capital stock of the company to $1,000,000 and have authorized the board of directors to negotiate for the purchase of several other pipe nipple manufacturing plants. The company's plan provides for merging of eight or ten such plants either by outright purchase or an exchange of stock.

American Institute of Steel Construction has awarded three cash prizes totaling $850 to university students who submitted the most authentic designs for a theoretical bridge in steel. The contest was held to stimulate interest in improved bridge designing.

New York

Heavy Tonnages of Pipe Pending for Gas Pipe Lines—Pig Iron Melt Sustained

NEW YORK, July 16.—The average melt of iron among the larger foundries is well sustained, but smaller consumers have been operating at a slightly reduced rate since the beginning of the quarter. Inquiry for third quarter iron, however, is active, with the present total for this district estimated at about 10,000 tons or more, and sales in the past week were in excess of 8000 tons. Among the sizable purchases of the week was 1000 tons of No. 1X foundry by the Draper Corporation, North Hopedale, Mass., which originally inquired for 2000 to 3000 tons. The Universal Winding Co., Providence, R. I., has closed on 700 tons of No. 1X and 600 tons of No. 2X foundry iron and the American Locomotive Co. has bought upward of 500 tons of foundry iron and a carload of malleable for its Schenectady, N. Y., plant. The New York Air Brake Co., Watertown, N. Y., has closed on a minimum carload of malleable of special analysis, reported to be for experimental purposes. About 3000 tons of foundry iron of a total inquiry for about 4000 tons, recently closed by the General Electric Co., Schenectady, N. Y., for various plants, is reported to have gone to the New England furnace, which has also booked about 10,000 tons of foundry iron for shipment to the pipe foundry at Burlington, N. J. Current inquiries for pig iron include some tonnage pending for a fortnight or more; about 4000 tons for plants of the American Radiator Co., 3500 tons for the Trenton, N. J., plant of the National Radiator Co., and about 2000 tons for the Chapman Valve & Mfg. Co., Indian Orchard, Mass. The Worthington Pump & Machinery Corporation, Harrison, N. J., is inquiring for 100 tons of foundry iron for Holyoke, Mass. Sales of Southern foundry iron in this district are rather limited, consumers apparently manifesting interest in it chiefly as a possible factor in bringing out lower prices from their usual sources of supply. Buffalo furnaces are quoting $18 a ton, base, on much of the small tonnage business in the market, but the larger and more desirable inquiries still bring out $17.50 a ton, with slightly lower prices on occasion.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	21.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.89 to 23.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—The number of orders for steel from warehouse stocks continues fair, but the tonnage per order has begun to increase in the past week. There is a moderate volume of structural steel buying, and demand for reinforcing bars is larger than early in the month. Recently some substantial business in plates has been reported by jobbers. Black and galvanized sheets are moderately active, but prices are still being shaded $1 to $2 a ton.

Cast Iron Pipe.—Buying by private companies has improved in the past week, but prices show no tendency to advance, ranging from about $30 to $32 a ton, base, f.o.b. Northern foundry. Current inquiries for pipe are in most cases for the larger diameters, which are cast by only a few makers. Syracuse, N. Y., has opened bids on about 2000 tons of 42-in. and 48-in. water pipe. Hartford, Conn., is accepting bids on a contract which will require 4000 to 5000 tons of pipe; 16,925 ft. of 42 or 48-in. and 2075 ft. of 36-in., Class B or Class C, with alternate bids on steel or reinforced concrete pipe. The Government of the Philippines is taking bids on about 1300 tons of 20-in., 36-in. and 54-in. water pipe for Manila.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $32.60 to $34.60; 4-in. and 5-in., $35.60 to $37.60; 3-in., $42.60 to $44.60. Class A and gas pipe, $3 extra.

Finished Steel.—Two large gas pipe line contracts are on the verge of being closed, one for 191,000 tons and the other for 250,000 tons. The contracts will cover the pipe for lines running from the Southwest into the Chicago district, but the orders will be placed in New York. The steel for one line, that of the Central States Natural Gas Co., mentioned a week ago as in prospect, is virtually closed, while the 250,000 tons to be bought is for a line to be built by Henry L. Doherty & Co., New York. Still another pipe line project is in the development stage and will be built by a group consisting of the Columbia Gas & Electric, Standard Gas & Electric, Utilities Power & Light and the American Gas & Electric companies. It is said that connecting links with existing gas lines will be built that will bring natural gas to Pennsylvania, New Jersey and New York utility companies. Main lines, with their connections, probably will require 1000 miles of pipe. About 600,000 tons of steel pipe has been ordered so far this year for gas lines alone; in addition, there has been considerable contracting for oil lines. Structural steel activity continues a prominent feature of steel buying in the New York district. The week's awards, totaling more than 14,000 tons in the district, included 5800 tons for a bridge over the Hackensack River in New Jersey, 2400 tons for the County Trust Co. building in New York and 1200 for a building for the Brooklyn *Daily Eagle*. Inquiries are headed by 4000 tons for a telephone building on Eighteenth Street, New York, and 2000 tons for a hotel at Atlantic City, N. J. In general, steel business shows a slight tapering off, but is

still unusually good for this time of the year. Except for continued weakness in wire nails and galvanized and black sheets, the price situation is steady. The top price, 3.70c., Pittsburgh, on galvanized sheets has virtually disappeared, current prices being 3.50c. to jobbers and 3.60c. to consumers.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Old Material.—Except for No. 1 and No. 2 heavy melting steel, the scrap market is quiet and prices are only moderately firm. Brokers with contracts at $16 a ton, delivered Claymont, Del., and $16.50 per ton, Coatesville, Pa., are paying $16.25 a ton, Claymont, and up to $16.75 per ton, Coatesville, to obtain sufficient No. 1 steel. A similar situation exists in No. 2 heavy melting steel, with brokers paying $13, delivered to a Phoenixville, Pa., consumer, and $13.50 a ton, delivered to Harrisburg, Pa. While only a small tonnage of No. 2 heavy melting steel is moving to the Pittsburgh district, brokers filling contracts for No. 1 steel with western Pennsylvania mills are paying up to $18.75 per ton, delivered, on a $5.30 a ton freight rate, or $13.45 per ton, New York. Heavy breakable cast is quiet, with $14.50 a ton quoted for delivery to eastern Pennsylvania and $15 a ton, delivered to a Florence, N. J., foundry.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast.	10.75 to 12.00
Stove plate (steel works)	7.75 to 8.25
Locomotive grate bars	8.25 to 8.75
Machine shop turnings	7.25 to 7.50
Short shoveling turnings	7.25 to 7.50
Cast borings (blast furn. or steel works)	7.00 to 7.25
Mixed borings and turnings	6.75 to 7.25
Steel car axles	19.25 to 19.75
Iron car axles	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.50 to 10.00
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought, long	11.00 to 11.50
Rails for rolling	13.00 to 13.50
Cast iron carwheels	12.25 to 12.50
Stove plate (foundry)	8.00 to 8.50
Malleable cast (railroad)	14.00 to 14.50
Cast borings (chemical)	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

Reinforcing Bars.—There has been a slight improvement in sales, although the market still is rather quiet. Awards and inquiries have consisted of lots ranging from 300 tons down to single carloads. Prices are unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Coke.—Demand for foundry coke is fair, but the furnace grade is rather inactive. Some by-product coke for industrial use is being shipped from a local operation by barge and rail to nearby consumers. Prices are unchanged at $2.75 to $2.85 a net ton, Connellsville, for standard furnace coke, and $4.85 a net ton, ovens, for special brands of beehive foundry coke. Delivered prices of foundry grade are: To northern New Jersey, Jersey City and Newark, $8.56, and to New York and Brooklyn, $9.44 a net ton. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Cleveland

Consumers Continue to Take Steel in Large Volume — Easier Deliveries in Sheets and Strips

CLEVELAND, July 16.—Specifications for steel bars, plates and structural material showed quite a gain the past week over the first week in the month. While orders increased in number, they were mostly for small tonnages. Consumer plants in this territory continue in good operation with a satisfactory volume of business on their books.

Manufacturers of steam shovels and other road building equipment are very busy. The only slowing down is in plants making forgings and stampings for the automotive industry. While these continue in good operation, several have abandoned night shifts. While further curtailment by some of the automobile plants is looked for in the next few weeks, others will increase production with the bringing out of new models in August. However, a good total production is being sustained due to the continued heavy output by the Ford and Chevrolet companies, and the automotive industry predicts that the third-quarter production of cars will exceed any previous record for the period.

Plates are in fair demand in small lots from tank and boiler shops. Local fabricating shops are busy with small work. New inquiry in the building field continues light. Toledo will take bids Aug. 13 for a Maumee River bridge, requiring several thousand tons.

Some of the sheet mills are caught up on deliveries but others are fully committed for six weeks or longer and there has been little curtailment in operation. Weakness in sheets has increased and extended to blue annealed grades. Cold-rolled strip is dull and some of the mills need orders, this being the only product on which mills are up on deliveries.

While there is some irregularity on steel bars, the price is being fairly well maintained at 1.95c., Cleveland. No deviation is reported from the 1.95c., Pittsburgh, price on plates and structural material.

Pig Iron.—The market did not show much activity the past week, during which Cleveland interests sold 11,000 tons of foundry and malleable iron. Not much inquiry is pending. Most foundries that have not yet bought iron for the third quarter seem disposed to keep out of the market until their present stocks are used up. Prices appear to be holding firm at $18.50, Cleveland, for outside shipment, $19 for local delivery and $20, Lake furnace, for delivery in the Michigan territory. Some furnaces report a falling off in shipping orders this month as compared with June and others expect to move about as much iron as last month, during which their shipments fell 10 per cent below the tonnage shipped in May. There has been considerable slowing down among some of the large-production foundries that supply the automotive industry. A number of malleable foundries that are making castings for the Ford Motor Co. are keeping up to recent operations. With decreased shipments, most of the furnaces are adding to their stock piles. A small cargo of pig iron was shipped from Buffalo to the Chevrolet Motor Co., Saginaw, Mich. The river channel has been deepened so that water shipments can be made directly to this company's plant, and it is expected that regular shipments will be made by water from Buffalo to Saginaw.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25	20.50
Malleable	19.50
Ohio silvery, 8 per cent	28.00
Basic Valley furnace	18.50
Stand. low phos., Valley	$26.50 to 27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—The leading local producer has its entire output for the third quarter sold. This mill has specifications to keep it operating at capacity for three weeks and specifications about equal production. While all third quarter contracts for sheet bars, billets and slabs were closed at

Warehouse Prices, f.o.b. Cleveland

	Base per Lb.
Plates and struc. shapes	3.00c.
Soft steel bars	3.00c.
Reinforc. steel bars	2.25c. to 2.50c.
Cold-fin. rounds and hex	3.65c.
Cold-fin. flats and sq.	4.15c.
Hoops and bands, No. 12 to ¼ in., inclusive	3.25c.
Hoops and bands, No. 13 and lighter	3.65c.
Cold-finished strip	*5.95c.
Black sheets (No. 24)	3.70c. to 3.90c.

Com. wire nails, base per keg	2.95

*Net base, including boxing and cutting to length.

$35, Cleveland, Youngstown or Pittsburgh, shipments of billets and slabs are still being made against $34 second quarter contracts that have not been cleaned up. One consumer is inquiring for 2000 to 5000 tons of slabs for October and November shipment.

Sheets.—Most consumers are showing more interest in getting deliveries of sheets on order than in placing new business. The falling off in the demand for auto body sheets is offset in a measure by a good demand for full finished sheets from makers of building material and other users. Furniture sheets and enameling stock are also active. Weakness has developed on blue annealed material, particularly in the heavy gages. Concessions credited to continuous mills of $2 a ton on light sheets and more on the heavier material or light blue annealed plates are reported. On black sheets 2.85c., Pittsburgh, is quite commonly quoted, although some material carrying the higher finishes is being taken at the 2.95c. base. Galvanized sheets have weakened to 3.50c., Pittsburgh, and there are reports of even a lower price.

Wire Products.—Wire continues to move in a fair volume and the price is well maintained. Nails are quiet and subject to price irregularities in some districts.

Warehouse Business.—While sales are not as heavy as in June, the volume of business is satisfactory for a summer month. Orders are well diversified. Sheets are quieter. All prices are well maintained.

Strip Steel.—Specifications for both hot and cold-rolled strip steel are moderate and deliveries have further improved. Several mills can make shipments in two weeks on both grades. Third quarter contracts for both hot and cold-rolled strip were closed during the week, at regular prices, by one of the automotive interests. Hot-rolled strip is firm at 1.90c. to 2c., Pittsburgh. On cold-rolled strip the market generally has settled down to a flat 2.75c., Cleveland, price, efforts to get a 2.85c. price for small lots evidently having almost wholly disappeared.

Bolts, Nuts and Rivets.—The demand for bolts and nuts, while lighter than a few weeks ago, is better than in July, last year. Rivet orders show a slight gain over those of June, which was a quiet month for the rivet industry. Prices are firm at regular quotations.

Coke.—The demand for foundry coke is light, both in specifications against contracts and in new business. Better brands of Connellsville foundry coke are firm. Ohio by-product coke is quoted at $8.25, Painesville, for July shipment.

Old Material.—The local market is at a standstill owing to restrictions of shipments of steel-making grades by two mills, and dealers are showing considerable anxiety to secure shipping orders. A fair amount of scrap is moving to the Valley district and this activity is apparently supporting the Cleveland market, which appears firm, although there has been no recent test of prices on steel-making grades for local delivery. Dealers are paying $17.50 to $17.75 for No. 1 heavy melting steel, $17 for compressed steel and $16.75 for new No. 1 busheling for Youngstown shipment. Old No. 1 busheling has advanced 25c. a ton. Other grades are unchanged.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	14.50 to 15.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.25 to 9.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50
Steel axle turnings	12.50 to 13.00
Acid Open-Hearth Grades	
Low phos., forging crops	17.75 to 18.00
Low phos., billet, bloom and slab crops	18.50 to 18.75
Low phos., sheet bar crops	18.00 to 18.50
Low phos., plate scrap	18.00 to 18.50
Blast Furnace Grades	
Cast iron borings	10.75 to 11.00
Mixed borings and short turnings	10.75 to 11.00
No. 2 busheling	10.75 to 11.00
Cupola Grades	
No. 1 cast	16.75 to 17.25
Railroad grate bars	11.00 to 12.00
Stove plate	12.00 to 12.50
Rails under 3 ft	18.50 to 19.00
Miscellaneous	
Railroad malleable	18.00 to 18.50
Rails for rolling	16.25 to 16.50

Philadelphia

Steel Orders Numerous But for Small Tonnages—Galvanized Sheets Lack Firmness

PHILADELPHIA, July 16.—Specifications against third-quarter contracts are in good volume, but tonnages are smaller than in the second quarter. Buying is well distributed, however, and most steel mills are booking more business than is usual at this season. While operations are still maintained at a high rate, delays in delivery are generally shorter.

Prices are well maintained except on black and galvanized sheets, certain sheet mills which had considerable automobile business in the past quarter being in need of tonnage since buying by the automotive industry has slackened.

Eastern Pennsylvania pig iron prices are fairly well maintained despite competition from Birmingham producers, reported still to have stocks totaling in excess of 500,000 tons. The steel scrap market is stronger, especially prices of No. 1 and No. 2 heavy melting steel.

Bars.—Deliveries of most mills are shorter, ranging from one to three weeks. Operating rates are high and specifications, although for small tonnages, are unusually good for the season. Bars are quoted at 1.95c., Pittsburgh, or 2.27c., delivered Philadelphia.

Pig Iron.—It is estimated by pig iron sellers in this district that upward of 6000 tons of Southern iron has been sold to eastern Pennsylvania consumers since Birmingham furnaces began to quote on the present price level. Southern iron prices are $14.50 per ton, Birmingham, for foundry and $13.50 per ton for basic, or on a $6.01 per ton freight rate by rail and water, via Savannah, Ga., $20.51 for foundry and $19.51 for basic, on cars, Philadelphia. The movement of Southern iron via Norfolk, Va., has thus far been somewhat limited, as this routing necessitates shipping a minimum cargo of 700 tons. The petition of the Eastern railroads to the Interstate Commerce Commission to postpone reduction of the rate from Birmingham to Atlantic Coast ports, via Savannah, from $6.01 to $5.25, has been granted and a delay of about seven months is expected. About 1500 tons of cylinder iron for the Baldwin Locomotive Works is not yet reported placed, but with Birmingham iron available at about $20.37 per ton, delivered, all rail, purchase of Southern iron appears likely. It is also suggested that 3500 tons of foundry iron for the Trenton, N. J., plant of the National Radiator Co. may also go to a Southern furnace. On the usual purchases of small lots of foundry iron, eastern Pennsylvania furnaces have not found it necessary to offer concessions of more than about 50c. a ton from $21.50 per ton, furnace, but a desirable tonnage might bring out further concessions. The Virginia pig iron producer is preparing to go into blast early in October, with reduced production costs and, by taking advan-

tage of rail and water delivery to Atlantic Coast ports, via Newport News, Va., may make an effort to sell iron competitively in eastern Pennsylvania.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.76 to $22.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	22.26 to 22.76
East. Pa. No. 1X	22.76 to 23.26
Basic (del'd east. Pa.)	20.25 to 21.00
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Reinforcing Bars.—Inquiry is improving slightly, but competition is keen. About 200 tons for the Hartel Avenue sewer, Philadelphia, has been awarded, both rail and billet steel bars being bought. The hospital building for the Woman's Medical College, Philadelphia, calls for about 300 tons of bars. Rail steel bars are quoted at about 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length. Sellers of billet steel bars are showing an increasing tendency to quote prices with no extra for cutting to length and certain eastern Pennsylvania mills rolling billet steel bars have quoted 1.95c., Pittsburgh, or 2.27c., Philadelphia, without the extra, which is equivalent to the rail steel bar price. Pittsburgh mills have quoted 2c. to 2.05c., Pittsburgh, or 2.32c. to 2.37c., delivered Philadelphia, usually adding the $5 extra for cutting to length.

Plates.—Deliveries range from two to three weeks, with specifications on contracts small in size, but numerous. Buying by locomotive builders and the railroads is quiet at present, but there is a fair tonnage of plates moving to car builders and fabricating shops, especially tank builders. The low bidder on a barge for the Central Railroad of New Jersey, calling for about 600 tons of plates, was the Bethlehem Steel Co., with the New York Shipbuilding Co., next. It is reported that the low bidder quoted on longer delivery than was specified in the inquiry. Plates are quoted at 2.05c., Coatesville, Pa., or 2.15c., delivered Philadelphia.

Shapes.—Prices range from 1.95c. to 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.11c., delivered Philadelphia. Fabricating shops are well occupied, but new business has slackened considerably. Recent projects in this district include about 2000 tons for an Atlantic City Hotel and a small tonnage for a soldiers and sailors memorial bridge at Harrisburg, Pa.

Sheets.—Blue annealed sheet prices are being maintained at 2.35c. per lb., Pittsburgh, or 2.67c., Philadelphia, for No. 13 gage and light plates, blue annealed, No. 10 gage are quoted at 2.20c., Pittsburgh, or 2.52c., delivered Philadelphia. Black sheets are being shaded $1 to $2 a ton on most current business, mills quoting 2.85c. to 2.95c., Pittsburgh, or 3.17c. to 3.27c., Philadelphia. Galvanized sheets have settled a full $2 a ton on recent business to 3.60c., Pittsburgh, or 3.92c., Philadelphia, and further concessions of $1 a ton or more have been made on desirable business. Certain mills, which were heavily engaged on automobile tonnage in the second quarter are now seeking business, while others not rolling automobile sheets are still asking up to four and five weeks delay in delivery.

Imports.—In the week ended July 13, arrivals at this port consisted of 153 tons of structural shapes from France and 35 tons from Germany.

Old Material.—No. 1 heavy melting steel is strong and an eastern Pennsylvania consumer is understood to have closed on 5000 to 10,000 tons of No. 1 steel at $17 per ton, delivered. No. 2 heavy melting steel is firm and a Pencoyd, Pa., mill has bought a small tonnage of automobile steel at $14.25 per ton, delivered. Stove plate is quotable at $12 to $12.50 a ton delivered, on the basis of a recent sale to a Harrisburg consumer at $12.50, and machine shop turnings show an advance of 50c. a ton on a sale at $12, delivered. There is a strong undertone to prices and available supplies of No. 1 and No. 2 heavy melting steel are not large.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00
No. 2 heavy melting steel	12.50 to 14.25
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 13.50
Heavy breakable cast (for steel works)	15.00 to 15.25
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	20.00 to 21.00
Rolled steel wheels	20.00 to 21.00
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 16.75
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

Steel Corporation Retires Total Bonded Debt

The board of directors of the United States Steel Corporation, at a meeting July 16, passed the necessary resolutions calling for redemption on Nov. 1 the entire outstanding issue of the corporation's 10-60-yr. 5 per cent bonds of 1963 at 110 and accrued interest. The amount of bonds of this issue outstanding at this date is $133,372,000.

To date the corporation, in accordance with the plan announced in letter to stockholders of March 5, has redeemed all but $15,880,000 of the outstanding issue of its 50-yr. 5 per cent gold bonds of 1951. Of this total, $7,933,000 are of the callable series and have been formally called for redemption on Sept. 1. Also on this latter date cash funds will be deposited with the trustee, at rate of 115 and accrued interest, to provide for purchase and retirement on presentation of such of the non-callable series bonds of this issue, now totaling $7,947,000, which may not have been redeemed prior to that date. Upon the retirement, or provision for retirement, of the 50-yr. 5 per cent bonds and the 10-60-yr. bonds, there will be fully discharged all of the bonded debt of the corporation.

Subscriptions for New Stock

Under the recent offer to stockholders to subscribe for additional shares of common stock at $140 per share, subscriptions have been received and recorded to date for 1,009,485 shares, or 99.3 per cent of the total of 1,016,605 shares offered. Some few subscriptions awaiting perfection of assignment of warrants and other details will probably add slightly to the total of 1,009,485 shares. Of the number of shares subscribed for, about 91 per cent were paid for in full on June 21 and 9 per cent were payable in installments on June 21 and on Oct. 1.

Employees' Stock Subscriptions

Under the employees' stock subscription plan for 1929, stock was offered on May 28 for subscription at $165 per share. The subscription closed on July 6, subscriptions having been received from 48,956 employees for a total of 83,079 shares. This compares with 49,612 subscriptions received for 94,077 shares in 1928, when the price at which the stock was offered was $145 per share

Newton Steel Earnings

YOUNGSTOWN, July 16.—For the second quarter this year the Newton Steel Co. reports record net earnings of $799,928, after all charges except preferred dividends, and after allowance for Federal taxes of $109,081. It is expected the company will show net profits this year equivalent to $12 per share of outstanding common stock.

Net profits of the company in the first half, totalling $1,519,890, exceeded net earnings for all of 1928 by $162,957.

The company has a large volume of unfilled orders and is assured near-capacity operations over remainder of the year. It makes full-finished auto body sheets. At Monroe, Mich., it is building a new sheet mill plant, to be closer to the heavy automobile production area.

Pacific Coast

Two Pipe Lines Will Require 24,000 Tons of Steel—Another of 149 Miles in Prospect

SAN FRANCISCO, July 13 (*By Air Mail*).—Demand for iron and steel products on the Pacific Coast is well sustained. Awards of the past week compare favorably with the totals for the last few weeks. Structural steel was the most active, and several fair-sized lots were placed, outstanding among which were 950 tons for an apartment in San Francisco, booked by McClintic-Marshall Co., and 630 tons for a bridge over the Salinas River for the State Highway Department. Pipe mill representatives and plate fabricators are keenly interested in the call for preliminary bids for a pipe line at Phoenix, Ariz., requiring 14,000 tons of plates, and the call for bids, at Seattle, for 10,000 tons for the Cedar River pipe line project, bids on which were postponed from July 5 to July 19.

Pig Iron.—Movement of foundry pig iron is limited to unimportant lots. No change in quotations is noted.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy. sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—While reinforcing steel bar awards this week fell below the previous week's total, upward of 1500 tons was booked. Among the larger lots were 416 tons for a bridge in California and 300 tons for highway work in Washington. Bids were opened this week on 168 tons for highway work at Phoenix, Ariz. Out-of-stock prices in the San Francisco district are unchanged at 2.20c., base, on carload lots and 2.60c., base, on smaller tonnages. Los Angeles out-of-stock quotations are $2 a ton higher. Demand for merchant bar steel is limited to unimportant tonnages, while the price remains firm at 2.35c., c.i.f. Coast ports.

Plates.—The largest plate award of the week called for 300 tons for a barge for the Santa Fe Railroad, placed with the Moore Dry Dock Co. Bids were opened this week on 100 tons for a 54-in. riveted steel pipe line for the East Bay Municipal Utility District, Oakland. Prices continue firm at 2.35c., c.i.f.

Shapes.—A fair amount of structural material was placed during the week, the total exceeding 3300 tons. The Isaacson Iron Works secured 160 tons for the City-County Building, Seattle, and 110 tons for a hangar for the Boeing Airplane Co., Seattle. Pending business is not of heavy proportions, but several fair-sized projects are scheduled to come out for figures in the near future. Plain material is firm at 2.35c., c.i.f. Coast ports.

Cast Iron Pipe.—Cast iron pipe awards of the week included 550 tons of 12-in. Class B pipe for a golf course at the Stanford University, which went to the United States Pipe & Foundry Co.; Palo Alto, Cal., 203 tons of 12-in. Class 150 pipe for the East Bay Municipal Utility District, Oakland, Cal., placed with the same interest, and 199 tons of 4 to 10-in. Class C pipe for San Diego, booked by Daley Corporation. The United States Pipe & Foundry Co. was low bidder on 2331 tons of 6 to 20-in. Class B pipe for the East Bay Municipal Utility District, Oakland. Bids were opened this week on 162 tons of 6 and 8-in. Class B pipe for Great Falls, Mont. New business calls for 1344 tons of 4 to 18-in. Classes C and D pipe for Vancouver, B. C., bids on which will be opened July 22 and for 1012 tons of 4 to 24-in. Class B pipe for Pasadena, Cal., bids on which will be opened July 18. Bert Noble was low bidder on 145 tons of 4 to 12-in. Class B pipe for San Diego.

Steel Pipe.—The Pacific Gas & Electric Co. has not yet taken any action on its inquiry for 2263 tons of 8⅝-in. O. D. gas pipe for installation at Gilroy, Monterey and Salinas, Cal. Eureka, Cal., placed a small tonnage of 2 and 3-in. galvanized standard pipe with the Lally Co. The Standard Oil Co. intends to build a pipe line in the San Joaquin Valley which will require 27 miles of 10-in. pipe, 50 miles of 8-in. and 72 miles of 6-in. pipe.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ⅞-in. and over	3.15c.
Small angles, under ⅞-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Buyers Cautious and Sales Are for Nearby Requirements Only—Steel Business Holds Up

BIRMINGHAM, July 16.—Pig iron buyers continue to pursue a conservative policy in covering their third quarter requirements, despite the recent reduction in price, which established the base at $14.50 for No. 2 foundry. Most of the buying is for two to four weeks' requirements. The recent reductions in prices have undoubtedly made buyers cautious. The total tonnage placed last week was a little better than that of the preceding week because of the steady run of small orders and the resumption of activities after the holiday period. Prices below $14.50, Birmingham, have been made on recent sales for Northern shipment. The volume of shipments was better last week than the week before and a still larger movement is indicated. Furnace operations have been unchanged for several weeks. Of the 17 stacks in operation, nine are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—New business in bars, plates and shapes is undiminished. Backlogs in these lines have changed very little in the past three or four weeks, the volume being approximately twice the amount it was at this time last year. Sheet buying is more pronounced than it has been at this season in the past. Several small orders for standard steel rails have been booked this month. Wire products' business continues to fall below the June rate. Mill operations remain at the peak reached early last month. All prices are the same. Structural steel fabricators report a fair volume of small orders, but no large orders. Two of the larger fabricators have heavy backlogs. Active open-hearths number 22 out of a total of 23.

Old Material.—New business continues slow and in small lots for early requirements. Demand for cast iron grades is almost nil. Prices are unchanged.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

Cast Iron Pipe.—New business of pressure pipe manufacturers was less last week than the average of the several weeks preceding owing to the absence of large orders. Awards are pending on the project at Oakland, Cal., requiring 2200 tons, and a project at Houston, Miss., requiring about 20,800 ft. of 6 to 8-in. pipe. A project at Griffin, Ga., requiring about nine miles of 16 to 20-in. pipe is still pending, as is the 700-ton job at Hollywood, Fla. The United States Pipe & Foundry Co. has booked an order for 6000 ft. of 8-in. and 17,000 ft. of 6-in. pipe for Alabama City, Ala. The demand as a whole is estimated to be 20 to 25 per cent under what it was at

this season last year. New business for several weeks has been made up almost entirely of municipal tonnages. The lowest operation of any plant is about 65 per cent and the highest about 95 per cent. Prices are firm at $37 to $38.

Coke.—Activity in the foundry coke market is confined to shipments on contracts, which are going forward at the steady rate of the past several weeks. Approximately 95 per cent of the ovens in the district are active. The base price remains at $5.

Boston

Pig Iron Prices Still Unsettled—Some Grade of Scrap Scarce and Price Trend is Upward

BOSTON, July 16.—New England pig iron prices are still very much unsettled. The Universal Winding Co., Providence, R. I., bought 1500 tons—800 tons No. 2X and 700 tons No. 1X—from the Mystic Iron Works and a Buffalo stack. The No. 1X is reported to have sold at $21.78 a ton, delivered, equivalent to $17.50 a ton on cars, Buffalo, while the No. 2X was sold on a delivered basis equal to $17.32 a ton, on cars, Buffalo, allowing for a $4.28 rail and water rate. Alabama iron is lower. Transactions in western Pennsylvania, New York State and Buffalo irons are reported largely in car lots. Competition for even these small tonnages is keen, and furnaces have been obliged to shade prices to secure orders. A textile machinery maker, previously reported as in the market for 1000 tons of iron, may buy 2000 to 3000 tons. A central Massachusetts foundry still is uncovered on a round tonnage.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	..	$21.28 to $21.78
†Buffalo, sil. 2.25 to 2.75	..	21.78 to 22.28
*Buffalo, sil. 1.75 to 2.25	..	21.91 to 22.41
*Buffalo, sil. 2.25 to 2.75	..	22.41 to 22.91
East. Penn., sil. 1.75 to 2.25		24.65
East. Penn., sil. 2.25 to 2.75		25.15
Va., sil. 1.75 to 2.25		25.21
Va., sil. 2.25 to 2.75		25.71
Ala., sil. 1.75 to 2.25		21.41 to 23.27
Ala., sil. 2.25 to 2.75		21.91 to 23.77

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.
†Rail and water rate.

Reinforcing Bars.—Current business in billet steel bars is confined to small tonnages, yet the weekly aggregate was satisfactory. Prices hold well at 2.66½c. a lb., base, from stock. The largest individual prospect is 100 tons for a local institution addition, but it is expected that a new bankers' building will soon require 1000 tons or more. The market for rail steel bars has become rather listless, with prices nominal at 2.26½c., base, delivered common Boston freight rate points.

Shapes and Plates.—Fabricators of shapes and plates are now well covered on material for third quarter. Plate deliveries are still backward, while those of standard shapes are generally on schedule. Contracts placed with structural steel fabricators the past week were few. It is expected that about 1000 tons for various bridges will be closed this week. A Congress Street (Boston) bridge, involving 1000 tons or more, will soon come up for figures.

Cast Iron Pipe.—Hopkinton, Mass., has bought 1000 tons of pipe from the United States Pipe & Foundry Co., and it is reported that 300 tons of 6 and 8-in. stocks has been placed with a French foundry for a water line between Hyannis and Craigville, Mass. Weston, Mass., will close bids July 23 for 400 tons of 6 to 12-in. pipe. Some of the usually active foundries will not bid on the 4500 tons of 36 and 42-in. pipe wanted by West Hartford, Conn., as they are well sold ahead on these sizes. Prices quoted openly on domestic pipe are: 4 in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12 in., $40.10 to $41.10; 16 to 20 in., $39.10. A $3 differential is asked on Class A and gas pipe.

Coke.—Specifications against last half by-product foundry coke contracts are increasing slowly. The price of such fuel remains at $11 a ton, delivered within a $3.10 freight rate zone.

Old Material.—Old material in general is scarce. Prices for available scrap wanted by Pennsylvania mills are higher. While $12 to $12.50 a ton on cars shipping point is the general price for No. 1 heavy melting steel, $12.75 was paid the past week. Steel turnings range from $6.60 to $7.10 a ton, as against $6.60 generally, a week ago, while dealers in most cases are paying slightly better prices for forge flashings, forge scrap and steel axles. The best most dealers will do on axles is $18 a ton, on cars, yet $18.50 and as high as $19 have been paid recently under special conditions. Railroad malleable is in demand, with $18.50 a ton, delivered, the common quotation. Specification pipe is the one material dealers cannot sell. Exporters are endeavoring to load the Norwegian steamer Karmoy with scrap for Danzig, but material is scarce. The Boston & Maine Railroad yesterday closed bids on approximately 65 cars of various kinds of scrap.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.00 to $12.75
Scrap T rails	11.50 to 12.00
Scrap girder rails	10.50 to 11.25
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.60 to 7.10
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	9.50 to 10.25
Forge flashings	10.25 to 10.50
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.25
Shafting	14.00 to 14.25
Steel car axles	17.50 to 18.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 12.75
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.50 to $14.75
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.50 to 12.00
Railroad malleable	18.50 to 19.00

Canada

Canadian Pacific to Buy More Cars

TORONTO, ONT., July 16.—The Canadian Pacific is taking bids on 31 freight and passenger locomotives, 121 sleeping and passenger cars, 1411 stone, coal, ore and flat cars, 300 freight and express refrigerator cars and 200 steel-sheathed automobile cars.

Pig Iron.—The summer holiday season is taking toll of business in this market. Forward delivery buying has practically ceased, following the active buying movement which terminated about a week ago. Spot sales are fairly numerous, but in small lots. Shipments are going forward in large tonnage. Canadian pig iron prices are firm, but unchanged.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal	
No. 1 fdy., sil. 2.25 to 2.75	$26.00
No. 2 fdy., sil. 1.75 to 2.25	25.50
Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel.—While there is a strong prospective demand for structural steel in connection with new building undertakings, actual sales

for the week were much below the weekly average for this year. New business was made up chiefly of lots under 500 tons. Inquiries and specifications are out, however, for substantial tonnages on which early closing is expected. Fabricating plants in Canada are running at full time, with backlogs sufficient to maintain present activities for several months.

Old Material.—Consumers continue to withhold new business from the old material markets. Current sales are mostly confined to spot needs of the small consumers, with little or no forward delivery buying. Prices are firm, but unchanged.

Dealers' buying prices:

	Per Gross Ton	
	Toronto	Montreal
Heavy melting steel.	$10.00	$8.50
Rails, scrap	11.00	9.00

Buffalo

Pig Iron Inquiry Totals 10,000 Tons

BUFFALO, July 16.—While a great many pig iron consumers are inactive in the purchasing departments because of inventory taking, a buying movement appears to have begun for the third quarter. A Batavia melter wants 1500 tons of foundry, and in the East several sizable inquiries are pending. Three of these embrace about 7000 tons of foundry and are respectively 3500 tons, 2000 tons and 1500 tons. A few small lots are being sold in the district at $19.50 for No. 2 plain. Producers estimate the total inquiry for the week at about 10,000 tons. Prices in the district are firm.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Warehouse Prices, f.o.b. Buffalo

	Base per Lb.
Plates and struc. shapes	3.40c.
Soft steel bars	3.30c.
Reinforcing bars	2.95c.
Cold-fin. flats, sq. and hex.	4.45c.
Rounds	3.95c.
Cold-rolled strip steel	5.85c.
Black sheets (No. 24)	4.20c.
Galv. sheets (No. 24)	4.85c.
Blue ann'l'd sheets (No. 10)	3.50c.
Com. wire nails, base per keg	$3.60
Black wire, base per 100 lb.	3.75

Finished Iron and Steel.—Most of the mills continue to operate at from 90 to 95 per cent of capacity. The fabricated structural market has been quite active and some very good business has been placed, including 1000 tons for a physical culture building at Rochester University; the Woodrow Wilson School at Binghamton, 200 tons; building for the Carborundum Co., Niagara Falls, 200 tons; bridges for the Youngstown-Olcott highway, 250 tons. Fabricators are awaiting action on the 8000-ton City Hall job. Bids go in July 19 for the 1600-ton Batchellerville viaduct north of Schenectady.

Old Material.—Strengthening of the market outside of Buffalo is reflecting itself here, though there has been no large buying movement. Some small tonnages of No. 1 heavy melting steel have been sold, and the market is strong at $17.25. There has been a little buying of No. 1 machinery cast scrap by some of the smaller consumers at $15.50 to $16. Railroad lists closed last week included No. 1 heavy melting steel, which brought $17.25, delivered Buffalo consuming plant. There is a shortage of knuckles and couplers and rolled steel wheels for this district. Prices offered are $21.00 to $21.50, Pittsburgh district points, against $19.00 to $19.50, Buffalo.

Prices per gross ton, f.o.b. Buffalo consumers' plants:

Basic Open-Hearth Grades	
No. 1 heavy melting steel.	$17.00 to $17.25
No. 2 heavy melting steel.	14.75 to 15.00
Scrap rails	16.50 to 17.00
Hydraul. comp. sheets	14.50 to 14.75
Hand bundled sheets	12.00 to 12.50
Drop forge flashings	14.75 to 15.00
No. 1 busheling	16.50 to 16.50
Hvy. steel axle turnings	14.00 to 14.50
Machine shop turnings	7.50 to 7.75
No. 1 railroad wrought	13.00 to 13.50
Acid Open-Hearth	
Knuckles and couplers	19.00
Coil and leaf springs	19.00
Rolled steel wheels	19.00
Low phos. billet and bloom ends	20.00 to 20.50
Electric Furnace Grades	
Short shov. steel turnings.	12.00 to 12.50
Blast Furnace Grades	
Short mixed borings and turnings	11.00 to 11.50
Cast iron borings	11.00 to 11.50
No. 2 busheling	10.00 to 10.50
Rolling Mill Grades	
Steel car axles	18.75 to 19.25
Iron axles	21.00 to 22.00
Cupola Grades	
No. 1 machinery cast	16.00 to 17.00
Stove plate	12.50 to 13.00
Locomotive grate bars	12.50 to 13.00
Steel rails, 3 ft. and under	19.00 to 19.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades	
Industrial	18.50 to 19.00
Railroad	18.50 to 19.00
Agricultural	18.50 to 19.00
Special Grades	
Chemical borings	12.50 to 13.50

St. Louis

Pig Iron Sold for Last Quarter—Southern Price Situation Restricts Buying—Scrap Steady

ST. LOUIS, July 16.—The first sales of pig iron for fourth quarter shipment were reported this week by the St. Louis Gas & Coke Corporation—500 tons to a St. Louis jobbing foundry and 200 tons to a Kansas City melter. Current prices prevailed. Total sales of that maker for the week were 5000 tons, including 500 tons to a Belleville stove plant, 500 tons to each of two Iowa foundries, 300 tons to a Kansas City specialty maker and 200 tons to an Oklahoma melter, all for third quarter. Melters generally are buying only for immediate requirements, apparently being uncertain as to the future because of the recent reductions by Southern makers. The local maker's quotations are unchanged, although it is understood prices in competitive territory are being met in some instances.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Finished Iron and Steel.—The Granite City Steel Co. reports an improvement in the demand for galvanized sheets, while demand for plates and blue annealed sheets continues brisk. Prices in all lines are being generally well maintained. While no large structural projects are being undertaken, steel fabricators report that there has been a marked improvement in the number of small contracts, which have reached a fairly large volume.

Old Material.—An improvement in both inquiries and shipments during the last week is reported. The amount of old material reaching this market

Cincinnati

Southern Pig Iron Weaker But Demand is Light—Cold Rolled Strip Sales Drop Sharply

CINCINNATI, July 16.—District consumers of Northern pig iron are continuing to go slowly in anticipating their needs and are buying only enough material to keep covered for 30 to 60 days. Consequently, new business, although in better volume than is usual in midsummer, is confined chiefly to purchases in small lots. Except for an inquiry from a Springfield, Ohio, melter for 400 to 500 tons, most of the quantities asked for range from 100 to 300 tons. In contrast with this fair activity in Northern iron, Southern iron continues dull and weak. The quoted price is $14.50, base Birmingham, but substantial concessions would undoubtedly be made on quantity orders. Silvery iron, which has been quiet for some time, has declined $1, bringing the new base price to $25.

Prices per gross ton, del'v'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.25	18.19
Ala. fdy., sil. 2.25 to 2.75	18.69
Tenn. fdy., sil. 1.75 to 2.25	18.19 to 18.69
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Coke.—Except for an order from an Indiana consumer to cover his needs for the next nine months, new business in foundry coke has been light. On the other hand, specifications against current contracts during the first two weeks of July have advanced slightly over the corresponding period in June, and indications are that consumers will take more coke this month on contract.

Finished Material.—Although demand failed to keep pace with production last week, causing a reduction in backlogs, district sheet mills have sufficient unfilled orders to maintain capacity output into late summer. One exception to this, however, must be noted. Cold rolled strip has slumped sharply, following the withdrawal of automobile manufacturers from the market. The fabricated material market continues dull, although several large undisclosed projects are reported to be under consideration. Except for these reports, the market generally is very quiet and current business is at a hand-to-mouth rate.

Old Material.—Although the mills are using large amounts of scrap, trading in old material is confined to carload lots. Despite this dullness a continued scarcity of good scrap has given the market an undertone of firmness and consequently prices have been maintained.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.25 to $13.75
Scrap rails for melting	13.75 to 14.25
Loose sheet clippings	9.25 to 9.75
Bundled sheets	10.50 to 11.00
Cast iron borings	9.00 to 9.25
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	6.75 to 7.00
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.00 to 13.50
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.25 to 19.75
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Railroad malleable	15.25 to 15.75
Agricultural malleable	14.25 to 14.75

Detroit

Seasonal Decline in Automobile Production Will Be Less Than Usual This Year

DETROIT, July 16.—While the seasonal decline in automobile production is now apparent, it will be less than usual this year. Figures for June so far obtainable show that virtually all makers except Packard are affected. Packard in June built more cars than in May.

The low-priced cars are still holding the field for volume. Ford set a new daily record during June with a production averaging 9100 units.

It is believed in some quarters that the heavy sales of Ford cars have had a tendency to slow up sales of used cars generally, which of course is re-

ESTIMATED AUTOMOBILE PRODUCTION FOR JULY
(Actual Figures for May and June Shown)

	May	June	July (Estimated)
Auburn	3,032	3,144	2,500
Buick	12,000	14,665	31,408
Cadillac and LaSalle	4,200	1,842	1,500
Chevrolet	160,895	151,297	150,000
Chrysler	54,595	42,351	25,000
Ford	200,903	177,419	175,000
Franklin	1,707	1,405	1,200
Graham-Paige	11,677	5,987	4,500
Hudson and Essex	42,086	31,737	28,000
Hupmobile	5,329	2,030	1,800
Nash	12,117	9,070	8,000
Oldsmobile and Viking	16,000	7,361	6,000
Packard	4,561	4,753	4,600
Reo	4,453	3,042	2,800
Studebaker	14,000	.....	9,000
Willys Overland	35,000	30,000	25,000

flected in the disposal of new cars in the medium-priced field.

While June figures are below those of May, this year, they show a gain of approximately 26 per cent over the output in June, 1928, and it seems reasonable that production this month will be at a corresponding ratio over the total for July last year.

New car stocks held by dealers are ahead of retail demand, but the margin is said to be satisfactorily small.

Although the demand for structural steel shows a recession, the decrease is of small consequence. Proposed new work includes a theater at Battle Creek, Mich., an armory for the Naval Reserve in Detroit, an automobile sales and service building in Detroit and a store and office building in Detroit, which together will require 1000 tons or more of steel.

Old Material.—There have been no sales involving any tonnage during the past week and prices remain same as quoted last week.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	12.75 to 13.25

Fabricated Structural Steel

Fresh Inquiries Are Largest of Year—Chicago Work Will Take 25,000 Tons

OF the 26,000 tons of structural steel lettings in the past week, approximately 40 per cent was for non-industrial projects, 25 per cent for bridge work, 20 per cent for industrial purposes and the remainder for miscellaneous jobs. It is interesting to note that more than 15,000 tons represented building activities in New England, New York and New Jersey.

Fresh inquiries, totaling more than 74,000 tons, were the largest this year. Construction work in Chicago will take about 25,000 tons, or about 30 per cent of the tonnage which came out during the week. Plans for bridges are being pushed in various parts of the country, pending jobs include 20,000 tons for that purpose.

The outstanding award was 5800 tons for a bridge over the Hackensack River in New Jersey. Among the larger inquiries are 15,000 tons for an Ohio River bridge, 14,000 tons of plates for a pipe line at Phoenix, Ariz., and 12,000 tons for an office and theater building at Chicago. Awards follow:

CAMBRIDGE, MASS., 100 tons, garage, to New England Structural Co.

STAMFORD, CONN., 500 tons, department store, to A. E. Norton, Inc.

NEW YORK, 2000 tons, Goldman-Sachs Building on Pine Street, to American Bridge Co.

NEW YORK, 2200 tons, County Trust Co. building, to A. E. Norton, Inc.

NEW YORK, 500 tons, apartment building on Seventy-ninth Street, to Paterson Bridge Co.

NEW YORK, 500 tons, apartment building on Park Avenue, to Paterson Bridge Co.

NEW YORK, 900 tons, public school No. 141, to Harris Structural Steel Co.

NEW YORK, 150 tons, building for New York Central Railroad at 161st Street and Morris Avenue, to unnamed bidder.

BROOKLYN, 1200 tons, printing building for *Brooklyn Daily Eagle*, to George A. Just Co.

NORTH BEACH, N. Y., 425 tons, two airplane hangars, to McClintic-Marshall Co.

STATE OF NEW JERSEY, 5800 tons, bridge over Hackensack River, to Strobel Steel Construction Co.

ROCHESTER, N. Y., 1000 tons, physical education building for University of Rochester, to McClintic-Marshall Co.

BINGHAMTON, N. Y., 200 tons, Woodrow Wilson School, to McClintic-Marshall Co.

STATE OF NEW YORK, 250 tons, bridges over Youngstown-Olcott Highway, to McClintic-Marshall Co.

PHILADELPHIA, 200 tons, warehouse in Frankford, to R. E. Lederle, Philadelphia.

BELLE, W. VA., 225 tons, extension to generator plant for Du Pont Engineering Co., to Virginia Bridge & Iron Co.

STATE OF NEW YORK, 118 tons, State highway bridge at Dunkirk, N. Y., to McClintic-Marshall Co.

ST. JOSEPH, MICH., 920 tons, foundry for Auto Specialties Mfg. Co., to Flint Structural Steel Co.

TORONTO, ONT., 150 tons, warehouse on Fleet Street, to Reid & Brown Structural Steel & Iron Works.

PITTSBURGH, 300 tons, Melwood Avenue garage, to Jones & Laughlin Steel Corporation.

STATE OF WEST VIRGINIA, 200 tons, two State highway bridges, to Pittsburgh-Des Moines Steel Co.

DAYTON, OHIO, 600 tons, steam station for Dayton Power & Light Co., to Dayton Structural Steel Co.

ROCK ISLAND, ILL., 750 tons, addition to motor building for International Harvester Co., to Gage Structural Steel Co., Chicago.

ROCK ISLAND, 200 tons, addition to power house for International Harvester Co., to Rock Island Bridge Co.

CHICAGO, 770 tons, Trustee System Building at Lake and Wells Streets, to Duffin Iron Co., local.

CHICAGO, 600 tons, Dallas Brass & Copper Co., to Hansell Elcock Co., local.

CHICAGO & WESTERN INDIANA RAILROAD, 825 tons, subway at Chicago, to American Bridge Co.

STATE OF IOWA, 150 tons, highway bridges in Cass County, to St. Joseph Structural Steel Co., St. Joseph, Mo.

MESA, ARIZ., 250 tons, taintor gates, Stewart Mountain dam, to unnamed bidder.

ELLENSBURG, WASH., 257 tons, crossing, Yakima River, to unnamed bidder.

SEATTLE, 160 tons, City-County Building addition, to Isaacson Iron Works.

SEATTLE, 110 tons, Boeing Airplane Co. hangar, to Isaacson Iron Works.

PULLMAN, WASH., 300 tons, field house for Washington State University, to unnamed bidder.

BERKELEY, CAL., 325 tons, infirmary for University of California, to California Steel Co.

SACRAMENTO, 630 tons, bridge over Salinas River, to unnamed fabricator.

SAN FRANCISCO, 300 tons plates and shapes, barge for Santa Fe Railroad, to Moore Dry Dock Co.

SAN FRANCISCO, 950 tons, apartment, O'Farrel Street near Leavenworth Street, to McClintic-Marshall Co.

ST. ARDO, CAL., 650 tons, highway bridge, to American Bridge Co.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

BOSTON & ALBANY RAILROAD, 500 tons, roundhouse at Boston.

NEW YORK, 4000 tons, building on Eighteenth Street for New York Telephone Co.

NEW YORK, 8300 tons, subway, route 107; contract awarded.

ATLANTIC CITY, N. J., 2000 tons, hotel.

GERMANTOWN, PA., 200 tons, Germantown Trust Co. building.

HARRISBURG, PA., unstated tonnage, soldiers' and sailors' memorial bridge.

PHILADELPHIA & READING RAILROAD, 300 tons, bridge work.

SCHENECTADY, N. Y., 1600 tons, Batchellerville viaduct; bids July 19.

BUFFALO, 200 tons, Erie County bridge.

TOLEDO, tonnage unstated, Maumee River bridge for city of Toledo.

AKRON, OHIO, 100 tons, Northwest office building for Ohio Bell Telephone Co.

MCKEES ROCKS, PA., 15,000 tons, bridge across Ohio River; plans not yet completed.

PITTSBURGH, 300 tons, two tow boats for Inland Waterways Corporation.

PITTSBURGH, 1300 tons, recreation building for H. J. Heinz Co.

MIDDLETOWN, OHIO, 300 tons, new building for Middletown Bank & Deposit Co.

CINCINNATI, 500 tons, six scows for United States Engineer; bids close July 17.

LOUISVILLE & NASHVILLE RAILROAD, 900 tons, office building at Louisville.

BIG FOUR RAILROAD, 2000 tons, bridge at Terre Haute, Ind.

CHICAGO, 1000 tons, building for Edison Electric Appliance Co.; previously reported at 600 tons.

CHICAGO, 6000 tons, International Tower; previously called Machinery Mart.

CHICAGO, 12,000 tons, office and theater on Wacker Drive.

CHICAGO, 6000 tons, Garret Biblical Institute Building.

CHICAGO, 2300 tons, Parker High School; Hansell Elcock Co. reported low bidder.

PRINCETON, WIS., 250 tons, Fox River bridge; bids close July 25.

MILWAUKEE, 110 tons, Newburg bridge in Washington County; bids close July 24.

PHOENIX, ARIZ., 14,000 tons plates, pipe line, ¼-in. plate material; preliminary bids being taken.

NEWPORT BEACH, CAL., 150 tons, bridge for improvement of Lido Island; bids July 15.

SEATTLE, 10,000 tons plates, 48-in. riveted pipe, Cedar River Pipe Line; bids postponed from July 5 to July 19.

WEST VANCOUVER, B. C., 800 tons, bridge over Capilano River for British Columbia Department of Public Works.

*Refinery quotation; price ¼c. higher delivered in the Connecticut Valley.

NEW YORK, July 16.

Tin.—The market has shown increasing strength during the past week. It is conservatively estimated that sales of Straits tin amounted to 1900 tons, the largest single week's business in the last month. The bulk of the buying has been done by consumers, and an unusual feature is the fact that some of the orders were for delivery as far ahead as February of 1930. The announcement of the formation of a British producers' association, looking toward the rationalization of the tin market, had a sentimental effect on business, but beyond that it had no special influence. Much discussion has arisen from the purchase by Patino Mines & Enterprises, Consolidated, of the interests of the National Lead Co. and of Simon I. Patino in the tin smelting plant of Williams, Harvey & Co., Ltd. Some observers believe that the deal will open the way for the Patino company to join the British producers' group in attempting to stabilize the market. Others argue, however, that no special significance should be attached to the transaction, since the National Lead Co. still owns a large block of stock in the Patino company, and therefore the sale is little more than a bookkeeping arrangement. Prices advanced steadily during the week from 45½c. to 47¼c. Spot metal, however, continues to sell at a discount of about 1c. a lb. The biggest day of the week was Monday, July 15, when 700 tons was sold. Spot Straits tin is quoted today at 47¼c., New York. The formal announcement of the organization of British producers resulted in a sharp increase in prices abroad, which are about £9 a ton higher than a week ago, with spot standard quoted at £213 15s., future standard at £217 7s. 6d. and spot Straits at £217 5s. Free selling in the East is noted, and the Singapore price today was £219 15s.

Copper.—While statistics for June show that stocks of refined copper increased about 12,700 tons, this was offset by a decline in blister output amounting to approximately 18,000 tons. The prevailing opinion in the trade is that these figures reveal an improvement in the market, and predictions are that the month of July will bring a reduction in refined stocks, thereby further strengthening the position of producers. Sellers find en-

Rolled Products

Prices on rolled non-ferrous products are unchanged from those prevailing one week ago.

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Cast aluminum	12.25c.	14.25c.

couragement in the fact that British importations of copper in June were 4 per cent greater than those of May. So far as buying is concerned, the past week was quiet, and sales averaged about 500 tons a day, against 1000 tons in the previous week. Most of the activity was confined to the export trade, domestic consumers having practically withdrawn from the market. Current reports are that the price of electrolytic copper is about to decline sharply. Producers declare emphatically, however, that these statements are propaganda of interests which are manipulating copper stocks on the New York Stock Exchange. They point out that quotations have held for several months in the face of an absence of buying and that nothing would be gained by concessions now. Therefore, quotations are unchanged at 18c., delivered in the Connecticut Valley, and at 18.30c., c.i.f. usual European ports. Lake copper is firm at 18c. to 18.12½c., delivered. Copper users apparently are letting stocks diminish to the vanishing point before placing further orders, and producers are confident that there must be a resumption of buying on at least a moderate scale in the near future.

Lead.—The American Smelting & Refining Co. reduced its price on Wednesday, July 10, to 6.75c., New York. This was followed immediately by a drop in quotations of the principal factor in the West to 6.60c., St. Louis, and later to 6.55c., St. Louis. Orders have been of fair volume.

Zinc.—Dullness persisted in prime Western zinc during the past week, but inquiries which appeared today indicate that there may be at least a slight pickup in business. Prices continue to range from 6.70c. to 6.80c., East St. Louis. There has not been sufficient business in the last few days, however, to make a real test of quotations. Companies which have been adhering to 6.80c. are holding to that figure and are getting a fair share of the orders.

Antimony.—The depression, noted a week ago, has continued with the result that holders of Chinese metal have been offering it at concessions. The present price is 8.25c. for spot and 8.50c. for futures, duty paid, New York.

Nickel.—Ingot nickel is quoted at 35c. a lb., with shot nickel at 36c. and cathodes of electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is selling at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 16.—The tin market is active and prices have advanced sharply. Quotations for zinc and antimony are lower. Sales in the old metals are scattered and in small volume.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 47.40c.; lead, 6.85c.; zinc, 6.65c.; in less-than-carload lots, antimony, 9.25c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

Railroad Equipment

New York to Buy 300 Cars for Subway Service

DULLNESS continues in the railroad equipment market. Scarcity of orders and inquiries for locomotives and cars indicate a present lack of interest on the part of carriers. The Rio Grande do Sul, Brazil, is asking for bids on 80 steel underframe box cars, 50 steel ballast cars and 21 passenger cars, while the New York City Board of Transportation is expected to buy 300 steel passenger cars for subway service. The Burlington is in the market for 25 locomotives. Details of the week's business follow:

New York City Board of Transportation is asking for bids by Aug. 20 on 300 steel passenger cars for subway service.

Hercules Cement Co. has ordered 10 cement cars from Standard Steel Car Co.

Warren Tank Car Co. has ordered five tank cars from Standard Steel Car Co.

Rio Grande do Sul, Brazil, is asking for prices on 80 steel underframe box cars and 50 steel ballast cars, also 21 passenger cars.

New York Central has ordered 75 express refrigerator cars from Merchants Despatch Transportation Co.

Great Northern has ordered two dining cars from Pullman Car & Mfg. Corporation.

Minneapolis & St. Louis has ordered three gas-electric motor cars from St. Louis Car Co.

Illinois Central has ordered five 600-hp. oil-electric locomotives from Ingersoll-Rand Co. and General Electric Co.

Northern Pacific will buy 11 2-8-8-2 locomotives.

Great Northern is in the market for 12 4-8-4 locomotives.

Texas Pacific will purchase five Mountain-type engines.

International Harvester Co. has placed 13 side dump cars with Pressed Steel Car Co.

Chicago, Burlington & Quincy is contemplating purchase of 25 locomotives.

Detroit & Toledo Shore Line will buy six Mikado locomotives.

Pere Marquette is considering the purchase of 10 coaches.

Ten open all-steel trolley cars have been bought in the United States by Bogota, capital of Colombia, Commercial Attache Walter J. Donnelly, Bogota, reports to the Department of Commerce. The cars, which accommodate 60 passengers each, increased the number of street cars in Bogota to 100, all of United States manufacture. They are operated by the Compania Tranvia Municipal de Bogota.

Reinforcing Steel

New Projects of 5700 Tons Largest Since March—Awards Total 3200 Tons

THE total of new projects, about 5700 tons, was the largest of any week since March. Outstanding was 2100 tons for the Ohio River boulevard in Pittsburgh, 900 tons for approaches to the Ohio River bridge at McKees Rocks, Pa., and 800 tons for track elevation of the Chicago, Milwaukee & St. Paul Railroad in Chicago. Awards of the week totaled about 3200 tons, of which the largest was 600 tons for an apartment building in Chicago. Awards follow:

NEW YORK, 200 tons, barracks at Mitchel Field, to Igoe Brothers.

CHICAGO, 600 tons, apartment building at 1100 North Dearborn Street, to Calumet Steel Co.

CLEVELAND, 250 tons, Union Terminal work, to Pollak Steel Co.

CLEVELAND, 100 tons, East Fifty-fifth Street bridge for Nickel Plate Railroad, to Bourne-Fuller Co.

CHICAGO, 160 tons, International Ink Co., to Calumet Steel Co.

GRAND TRUNK RAILROAD, 400 tons, to an unnamed bidder.

WALLA WALLA, WASH., 100 tons, women's prison building, to Northwest Steel Rolling Mills.

OLYMPIA, WASH., 300 tons, highway work, to Northwest Steel Rolling Mills.

SEATTLE, 150 tons, apartment building and school in Olympia, to Northwest Steel Rolling Mills.

SACRAMENTO, 120 tons, bridge in Sacramento County, to unnamed bidder.

SACRAMENTO, 256 tons, bridge over Salinas River, to unnamed bidder.

SACRAMENTO, 416 tons, bridge over Cottonwood Creek, to unnamed bidder.

SACRAMENTO, 133 tons, paving in Madera County, to unnamed bidder.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

BOSTON, 100 tons, Perkins Institute for Blind Industrial House.

DELAWARE, LACKAWANNA & WESTERN RAILROAD, 300 tons.

NEWARK, N. J., 350 tons, garage.

PHILADELPHIA, 300 tons, hospital building for Woman's Medical College.

PITTSBURGH, 2100 tons, Ohio River Boulevard; Booth & Flinn, Ltd., general contractor.

MCKEES ROCKS, PA., 900 tons, approaches for Ohio River bridge; Dravo Contracting Co., general contractor.

CINCINNATI, 200 tons for Rubel Baking Co.; bids July 27.

CINCINNATI, 375 tons, new plant for Mosby Medicine Co.

CHICAGO, MILWAUKEE, ST. PAUL & PACIFIC, 800 tons, track elevation at Chicago; Thorgensen & Erickson, general contractors.

PHOENIX, ARIZ., 168 tons, paving and 14 bridges, Douglas-Rodeo Highway; bids opened.

ELLENSBURG, WASH., 143 tons, North Branch Canal project; division No. 2, bids Aug. 9.

PERSONAL

R. W. PROCTER, formerly of the Black & Decker Mfg. Co., Towson, Md., has been appointed general sales manager of the Van Dorn Electric Tool Co., Cleveland, which is a subsidiary of the Black & Decker company. He succeeds LYMAN H. BELLOWS, who recently resigned.

—

HERBERT W. SMITH, formerly in charge of selling scrap for the Hudson Motor Car Co., has become vice-president of Samuel G. Keywell Co., Detroit, scrap dealer.

—

WARREN C. WEBB has been appointed Pacific Coast sales manager, with offices at 443 East Third Street, Los Angeles, for the W. A. Jones Foundry & Machine Co., Chicago.

—

R. C. BROWER, heretofore general manager of the Timken Roller Bearing Service & Sales Co., Canton, Ohio, has been appointed assistant secretary and assistant treasurer of the Timken Roller Bearing Co., and he is being succeeded by W. H. RICHARDSON, formerly manager of the New York office of the Service & Sales Company. E. H. AUSTIN, manager of the Kansas City branch, becomes manager of the New York office and L. J. HALDERMAN, manager of the office at Atlanta, Ga., has been made manager at Kansas City. PARKER T. ANCARROW, of the Richmond, Va., branch, succeeds Mr. Halderman at Atlanta, and STEWART B. ANCARROW becomes manager at Richmond.

—

HUGH SCOTT has been placed in charge of the St. Louis office of the Union Chain & Mfg. Co., Sandusky, Ohio, and A. R. YOUNG heads the Indianapolis office of the company.

—

R. N. JESSOP, formerly Chicago district sales manager, motor department, of the Ohio Electric & Controller Co., Cleveland, has been appointed sales engineer of the company with office at Cleveland.

—

ARTHUR D. LITTLE, president, Arthur D. Little, Inc., Cambridge, Mass., delivered his presidential address on "Science and Labor" before the Society of Chemical Industry, London, at Manchester, England, July 9. He has been awarded the honorary degree of Doctor of Science from the University of Manchester and Honorary Associateship in the Manchester College of Technology.

—

WILLIS L. KING, vice-president, Jones & Laughlin Steel Corporation, Pittsburgh, was honored by 80 executives and department heads of the company on July 12 by a dinner at the Pittsburgh Golf Club in observance of the completion of 60 years of service with the company. G. M. LAUGHLIN, JR., chairman of the board of the company, presided and Mr. King was presented with a platinum watch, suitably engraved.

—

R. H. MADDOCKS, New York district sales manager of the Central Iron & Steel Co., Harrisburg, Pa., will sail July 19 on the Olympic for six weeks European trip. He will visit France, England and Scotland.

—

J. G. BELDING, for the past 11 years general manager of the Lombard Iron Works & Supply Co., Augusta, Ga., at the annual meeting of the board of directors on July 3, was elected president of the corporation. He succeeds the late GEORGE R. LOMBARD, founder of the company. Mr. Belding is vice-president of the Southern Metal Trades Association and past president of the Southern Supply and Machinery Dealers' Association.

—

W. H. WARREN, general superintendent of the plant of the Lukens Steel Co., Coatesville, Pa., has been elected vice-president in charge of operations. A vacancy in the office of vice-president occurred recently when HORACE B. SPACKMAN became chairman of the executive committee. HUGH KENWORTHY succeeded Mr. Spackman as manager of purchases.

—

W. TRINKS, professor of mechanical engineering at the Carnegie Institute of Technology, Pittsburgh, has left for an extended trip of investigation in Europe this summer.

—

WILLIAM C. DICKEY, New York sales agent for the Worth Steel Co., the Thomas Steel Co. and the New Haven Copper Co., will sail July 26 on the Ile de France for Europe. He will visit England, France, Switzerland and Italy, sailing from Naples on the Conte Grande on Aug. 31.

—

J. R. POYSER plans to sever his connection with Doelger & Kirsten, Milwaukee, Sept. 1. From 1910 to July, 1922, he was connected with the Canton Foundry & Machine Co., Canton, Ohio, becoming secretary in charge of sales and advertising. He has been sales manager of Doelger & Kirsten since March 1, 1923.

—

HENRY CLAY GRATON, one of the founders of Graton & Knight Co., Worcester, Mass., celebrated his 99th birthday on July 9.

—

FRANK J. PHILLIPS, for many years associated with the Concrete Steel Co., Boston, and recently with the General Fireproofing Co., at Philadelphia, has again associated himself with the Boston concern.

W. R. CUNNICK has been appointed district sales manager at Detroit for the Weirton Steel Co., Weirton, W. Va., succeeding A. J. BOPP, who recently resigned to enter business for himself.

—

H. H. RICE, of the General Motors Corporation and treasurer of the National Automobile Chamber of Commerce, and J. WALTER DRAKE, of the Hupp Automobile Co. and former Assistant Secretary of Commerce, have been appointed by President HERBERT HOOVER members of a delegation to represent the United States at the Pan American Highway Congress to be held in Rio de Janeiro in August. Mr. Drake will be chairman of the delegation.

—

GEORGE A. V. RUSSELL, formerly manager of the engineering department of the Brightside Foundry & Engineering Co., Ltd., Sheffield, England, now engineer of the metal group companies of the Imperial Chemical Industries, Ltd., Birmingham, has sailed from Quebec on his return trip to England after an extended stay in the United States and Canada.

—

E. J. BURNES, who since the first of the year has been assistant general sales agent of the Chateaugay Ore & Iron Co., has been appointed general sales agent of the company, with headquarters at 26 Liberty Street, New York, as successor to Ralph W. Clark, deceased. Mr. Burnes was for five years in the New York office of Pilling & Co. and for a year before his connection with the Chateaugay interests was with the Semet-Solvay Co.

—

GEORGE A. PUGH has been elected a vice-president of the Aetna Standard Engineering Co., Youngstown, and will be in charge of machinery sales. H. E. MELIN has been appointed assistant manager of machinery sales. M. D. BAUGHMAN has been made manager of the operating department and will have charge of the plants and production at Ellwood City, Pa., and Warren, Ohio.

—

MYRON C. TAYLOR, chairman of the finance committee of the United States Steel Corporation, attended on July 15 in Detroit the launching of an ore steamboat that was named for him. The vessel will be added to the corporation's ore-carrying fleet, operated by the Pittsburgh Steamship Co.

—

W. S. PILLING of Pilling & Co., Philadelphia, leaves New York for San Francisco on July 20, with a party of friends to begin a round-the-world tour, expected to extend over nine months to a year. Hawaii, Japan, China, Indo-China, Siam and India, Arabia, Turkey and various European countries are included in the itinerary.

OBITUARY

CHARLES E. SCOFIELD, New York district sales manager of the Wheeling Steel Corporation since 1922 and for 35 years or more identified with distribution of sheet steel in the New York territory, died July 9 of heart failure as he was going to dinner in his summer home at Rowayton, Conn. He was 51 years of age. He started in the sheet business as a boy in the New York office of Merchant & Evans Co., of Philadelphia. He was with the Wheeling Corrugating Co. from 1907 to 1922. For three years he was in

C. E. SCOFIELD

charge of city sales for that company, and during the remainder of the period he was district sales manager. Mr. Scofield was in his office at 120 Broadway, New York, the day of his death. Not feeling well, he went home at noon and after a nap in the afternoon arose for dinner. He was a Mason, a member of the New York Athletic Club and the Shore Haven Country Club, Shore Haven, Conn.

—

JOHN S. RUNNELLS, retired chairman of the board of the Pullman Co., died June 18 at Chocorua, N. H. He would have been 85 years old on July 30. He was graduated from Amherst College in 1865 and later was admitted to the bar in Iowa and practiced law at Des Moines, where he remained until 1887. That year he was appointed counsel for the Pullman Co. and later vice-president and general counsel, and from 1911 to 1922 was president of the company.

—

E. S. GABRIAULT, erecting engineer with the Nordberg Mfg. Co., Milwaukee, and in their employ for 20 years, died, July 5, at Lima, Peru, where he had gone to supervise the installation of Nordberg power equipment for a large mining company. He left Milwaukee, May 28, on this trip.

P. J. LANDWER, assistant production engineer of the Wright Aeronautical Corporation, Paterson, N. J., died on July 10. He had been associated with the company for one year and previously had been connected with Mack Trucks, Inc.

—

WILLIAM F. FAIR, blast furnace superintendent, Youngstown Sheet & Tube Co., Youngstown, died suddenly at his home in that city on July 10. He was 50 years of age and had been employed by the company for 21 years.

—

WALTER F. HOOKER, manager of the Boston branch of Graton & Knight Co., Worcester, Mass., died at his home in Melrose, Mass., July 9. He was associated with the Worcester concern 30 years, starting in the workshops and working up to the Boston management. He was born in Lee, Mass., 53 years ago.

—

H. O. CARY, at one time superintendent of the DeKalb plants of the American Steel & Wire Co., died June 19 at his home in Bangor, Mich. He was 79 years of age and had been in failing health for over a year.

—

FREDERIC H. POOR, head of Frederic H. Poor, Inc., 50 Church Street, New York, manufacturer and distributer of tractor cranes and allied products, died at his home, 112 Park Avenue, Yonkers, N. Y., on July 9, at the age of 47. He had been ill for some time. Mr. Poor was a graduate of Harvard University in the class of 1903 and a year later received an engineer's degree at the same university. He went with the General Electric Co., remaining there five years at Schenectady, N. Y., and then moving to the New York office. In 1910 he became general manager of the S K F Ball Bearing Co., New York, and introduced that company's product in the United States. During the war he was president of the Triplex Safety Glass Corporation, New York. In 1919 he formed the firm of Wesselhoeft & Poor, which exported a wide variety of machinery to Colombia and Venezuela through four branch offices in those countries. This business was sold in 1926 to the International General Electric Co., and Mr. Poor afterward organized his own company.

—

WILLIAM YATES, for 45 years an employee of the Heppenstall Forge & Knife Co., Pittsburgh, and most recently superintendent of the plant, died at a Pittsburgh hospital on July 14, aged 77 years.

—

OTTO GOSSELL, for a number of years representative in Great Britain for the German steel producers Dortmunder Union and Aachener Hutte, with headquarters in London, died July 13. He was 80 years of age and had been a member of the Iron and Steel Institute (British) since 1880.

—

JOSEPH HAMMELE, sales manager and a director of the Bausch & Lomb Optical Co., Rochester, died July 2. He had been associated with the company since 1882.

—

GEORGE T. MOLYNEAUX, vice-president of the Price Iron & Steel Co., Chicago, broker in scrap iron and steel, died following a heart attack July 12 at the age of 35 years. He was born at Bristol, Tenn., where funeral services were held. After graduating from Yale University, he was for a number of years assistant professor of languages. At the time of his death he was an associate professor at the University of Ontario. He was well-known in educational circles as a linguist and a historian. He was a member of the Hamilton Club and the Chicago Yacht Club.

Second Quarter Earnings of Steel Companies

Net earnings of the Acme Steel Co. for the first six months of 1929 showed an increase of 16 per cent over the corresponding period of 1928. Net profit for the six months just ended, after all expenses, Federal and local taxes and depreciation, was $1,730,671, being at the rate of $6.31 a share. Net profits for the first six months of 1928 were $1,014,590. This company has recently erected three new buildings, one as an addition to the cold-rolled strip plant, another to house a new hot-rolled continuous strip mill and a third to be used as a warehouse. The two additional mill units will be ready to operate on or about Oct. 1.

A. M. Castle & Co. report record earnings for the second quarter and for the first six months of 1929. For the quarter ended June 30, net profits were $235,991, after all charges, including depreciation and Federal taxes, equal to $1.96 a share earned on 120,000 common shares. This compares with $1.61 a share in the previous quarter and $1.59 a share in the second quarter of last year. Net for the first six months was equal to $3.58 a common share, compared with $2.71 a share earned in the first half of 1928.

A 20 per cent common stock dividend on a basis of one new share for each five held has been voted by the directors of the Youngstown Sheet & Tube Co., Youngstown. They have also voted to increase the no par common stock from 1,000,000 no par shares to 2,000,000 shares. A special meeting of stockholders has been called for Aug. 15 to secure ratification of the directors' action.

European Steel Markets Less Active

British Holidays Ease Conditions—Germany Making Much Steel in Open-Hearth Furnaces—Spain Produces More Steel

(*By Cable*)

LONDON, ENGLAND, July 15.

CLEVELAND furnaces are now offering to accept last quarter pig iron contracts on a basis of £3 12s. 6d. ($17.58) per ton for No. 3 foundry, but buyers show no haste in contracting, as the Scottish holidays have begun and the English holidays will follow shortly. Meanwhile coke and ore prices are stronger and pig iron producers assert that production at present prices is unprofitable.

Hematite iron producers are active sellers, principally for export, and some good contracts for forward delivery have been negotiated.

Finished steel is generally quiet, but most Northeast Coast mills are well occupied with current contracts. Export inquiry is fair, but expansion of Far Eastern business is hindered by the unfavorable exchange rates.

British exports in June were 35,000 tons of pig iron, of which the United States received 1000 tons. Total exports of iron and steel were 307,000 tons.

Tin plate prices are irregular, as some mills are seeking orders, while others are well engaged. Higher tin prices are influencing consumers and inquiry has increased, but business is still only fair.

Galvanized sheets are quiet. Exports in June totaled 43,000 tons, the smallest since the coal strike period in 1926. India took only 8000 tons. Calcutta stocks are still large, so that little improvement in demand is expected for some time. Japan has bought further small lots of both heavy and light-gage black sheets.

Thomas W. Ward, Ltd., Sheffield, has purchased from the Frodingham Iron & Steel Co., Ltd., Scunthorpe, a large part of the properties of the Yorkshire Iron & Coal Co., Ltd., Leeds.

Continental markets are dull, but there is pressure from certain mills to secure orders. Semi-finished steel and merchant bars are especially easy, but shape and plate prices are being maintained.

Belgian works are reported to have secured about 30,000 tons of rails from Belgian railroads, which should aid in steadying the semi-finished market. The International Wire Rod Cartel has decided to maintain export prices, except those for the Far East, which have been modified as a result of reduced freight rates.

French production in May was 897,000 tons of pig iron and 819,000 tons of raw steel. Hanomag has secured an order for 52 locomotive boilers for India.

British Pig Iron Shortage Continues—Steel Active

LONDON, ENGLAND, July 5.—The principal feature of the iron and steel market is the continued increase in strength of pig iron prices. Demand from both domestic and export buyers is large and an even greater volume of business could be done if larger supplies were available. In the Cleveland district, especially, the shortage of iron is acute and consumers have been forced to supplement their supplies by purchases in other districts. The shortage is the result of insufficient coking coal and iron ore, which is preventing the blowing in of more furnaces.

At present there are 44 furnaces in blast in the Cleveland district, but by fall it is expected the total will have increased to 50. Producers of foundry, forge and basic iron are fully sold until October, and have not yet opened their books for last quarter tonnage. As a result, merchants with pig iron in stock are obtaining high prices for prompt shipment. Hematite iron is also stronger as a result of substantial buying by both domestic and foreign users.

Finished iron and steel production is steady, but curtailment is expected shortly with the arrival of the Glasgow annual holiday period. A number of plants in that district will suspend operation for only 10 days, while others will close for a full fortnight. New business has not been especially large, but specifications against contracts have been heavy, particularly for shipyard material. Export trade is still only moderately active.

Germany Large Exporter of Open-Hearth Rods

HAMBURG, GERMANY, June 24.—German mills have become a dominant factor in the export of open-hearth wire rods and rivet stock. While there is no actual agreement in the Wire Rod Cartel, allocating open-hearth steel orders to Germany, both Belgian and French producers have gradually retired from this field and in most cases do not quote on such inquiries. German mills, in turn, are not offering much competition for Thomas steel business in wire and rivet rods.

The nominal quotation on open-hearth rods, No. 5 B.W.G., is £6 12s. 6d ($32.13) per ton, but almost no orders have been closed at less than £6 15s. ($32.73) per ton, and as most business in open-hearth steel is limited to orders for 50 to 250 tons, the price is about £6 17s. 6d. ($33.34) per ton.

Rivet manufacturers in Holland and Scandinavian countries, which import their supplies of open-hearth rods, have been unable to obtain lower prices from either Belgium or France on the sizes most used, 3/16-in., ¼-in. and 5/16-in. Rods for the drawing of fine music wire and wire rope are almost exclusively supplied by Germany.

Output of Open-Hearth Rails Increasing

HAMBURG, GERMANY, July 1.—Although the German Railroad Corporation recently informed the steel industry that there would be no restriction placed on the continued use of Thomas steel rails, output of this grade is constantly declining. Prior to 1913 the ratio of Thomas steel rails to open-hearth was 78 to 22, in 1924 the ratio had declined to 67 to 33 and by the end of last year it was 48 to 52. At present it is estimated that of every 100 tons of rails rolled in Germany, 55 tons are open-hearth and 45 tons Thomas steel. This increase of open-hearth rail production is expected to continue.

Steel Merchants to Restrict German Export Activity

HAMBURG, GERMANY, July 1.—The meeting here on June 28 of the Federation of German Industries and the Federation of German Exporters discussed at considerable length the relationship of the German steel and hardware industry and the exporters. Although no general agreement was established between the two associations, it appears certain that in the future the German hardware industry will, to a great extent, withdraw from direct export business, into which it entered following the war. The greater part of the heavy steel exports, however, will continue to be made through the selling organizations of the steel industry. This is expected to lead to an improvement in the profits of export trade in hardware and small steel products, which have been seriously restricted in the past because of keen competition between the hardware and steel merchants and the exporters.

*Exports of American Portable Pneumatic Metal-Working Tools**

Country of Destination	1928	1927
United Kingdom	$464,888	$505,073

*Report made by L. J. Cochrane, Industrial Machinery Division, Department of Commerce.

Spanish Steel Output Increased in 1928

MADRID, SPAIN, July 20.—Production of steel in Spain was about 8 per cent more in 1928 than in 1927 and a further increase is expected for 1929. Total output of pig iron was 565,000 metric tons, of steel ingots 733,650 tons and of finished products 692,887 tons. A total of 4129 tons of ferromanganese and 149 tons of ferrosilicon was produced in 1928.

Germany Second in Steel Consumption

HAMBURG, GERMANY, June 24.—Efforts of the German steel industry through the publicity department of the Stahlwerks-Verband A. G. to extend the use of steel in Germany are meeting with success. In the per capita consumption of steel, Germany ranked fourth in 1926, with the United States first, Great Britain second and Sweden third. Last year Germany ranked second with 546 lb. per capita, compared with 526 lb. per capita in Great Britain and 438 lb. per capita in Sweden. France was fifth with 392 lb. per capita, Belgium sixth with 381 lb., Holland seventh with 356 lb., Switzerland eighth with 312 lb., Czechoslovakia ninth with 224 lb., and Denmark tenth with 222 lb. The lowest European consumption of steel was in Russia, with only 53 lb. per capita.

Establishes Wire Publicity Bureau

HAMBURG, GERMANY, July 1.—German steel advertising through the Stahlberat Ungestelle at Düsseldorf is to be extended by the establishment of a second organization, the Drahtberatungsstelle, which will issue publicity and extend information on wire and its uses. Advertising of the new bureau advocates the wider use of wire and consumers will be freely advised on the kinds and qualities of wire they may require. Wire netting is now being widely used in Germany for road construction and the efforts of the new bureau will be directed to increasing this use both in Germany and in foreign markets.

New Company to Operate Famous Sheffield Works

LONDON, ENGLAND, July 2.—Andrews, Toledo, Ltd., has been formed to acquire the plant and assets, as of Nov. 3, 1928, of the old-established mill of Jno. Hy. Andrew & Co., Ltd., Sheffield. The new company has capital stock of £300,000 ($1,455,000), and the board of directors includes J. F. Parker, chairman, G. St. J. Strutt and Engineer Vice-Admiral Sir George Goodwin.

The plant, which manufactures all kinds of high-grade tool steels for the automobile and aircraft industries and wire rods, is to be modernized throughout.

Records Observations of Transcontinental Trip

S. A. Gabel, president Summerill Tubing Co., Bridgeport, Pa., was a member of the special party which made the inaugural trip of the Transcontinental Air Transport, Inc., just previous to the opening of the combination air and rail passenger route operated jointly by T. A. T. and the Pennsylvania Railroad. On the journey Mr. Gabel kept a log in which he recorded his observations. At Wichita, Kan., where the plane landed for a short time, he found that airplane manufacturers in that district are rushed with orders. When the trimotored plane was in New Mexico, he noted that the motors were using about 60 gal. of gasoline an hour and were making about 1600 r.p.m.

Machinery Markets and News of the Works

Machine Tool Sales Decline

Current Bookings, However, Are 20 Per Cent Better Than in Same Period Last Year

REPORTS from machine tool centers reveal that bookings this month have fallen below those of June. However, the New York district has been an exception, with sales equaling or slightly exceeding last month's volume.

Despite the seasonal recession in buying, it is estimated that current business shows a gain of approximately 20 per cent compared with the same period in 1928. The general run of orders has been for replacement purposes and has come from most consuming lines.

A Connecticut machine tool builder has closed for $200,000 worth of equipment, and the Packard Motor Car Co. has bought a few tools for the manufacture of Diesel engines and is expected to purchase a number of additional machines. The General Electric Co. is inquiring for about 30 tools for its electric refrigerator division at Schenectady, N. Y.

Machine tool deliveries are improving slightly, but still range in most cases from six weeks to three months or longer. An important lathe manufacturer cannot make deliveries sooner than the first quarter of 1930.

"June reflected the seasonal tendency toward a slackening in the volume of orders and the falling off has been sufficient to accelerate slightly the downturn of the three months' average index which was indicated in May for the first time since the summer of 1928," states the National Machine Tool Builders Association. "Even so, the rate of recession is not alarming, and so far as can be interpreted at the present time, it cannot be looked upon as a signal that the period of good demand that the industry has been enjoying for the past 12 months is over. The ratio of unfilled orders to shipments shows that the industry still has as good backlog of unfilled orders to work off during the summer months, even though shipments have been stepped up since February to a rate approximately 25 per cent above the rate of shipments last fall."

The association's index of gross orders stood at 291.6 for June, as against 334.3 for May. Shipments totaled 295.5, compared with 300.8 in May, the decline in shipments having been responsible for a slight upturn in the index of unfilled orders, which was 721.8 for June, compared with 721 for May.

New York

NEW YORK, July 16.—Machine tool buying in the first half of July was sustained at a high level, comparable with that in the corresponding period of June. In fact, some dealers declare that sales have been larger than those of last month. The substantial volume of business booked in the past two weeks, together with heavy pending inquiries before the trade, indicates that the usual summer let-down is not likely to materialize this year, and both dealers and manufacturers expect buying to be maintained at a satisfactory rate during the remainder of July and in August.

Several companies state that orders are running approximately 25 per cent ahead of those in the early part of the summer of 1928, despite the fact that deliveries now range from one to three months or longer on numerous tools. The general run of business is for replacement purposes and is distributed among most consuming lines. In some cases companies are in the market for the first time since 1920. The General Electric Co. is inquiring for about 30 tools for its electric refrigerator manufacturing division at Schenectady. Otherwise, purchases and inquiries are for from one to three machines each.

Officials of Fairchild Aviation Corporation, 270 West Thirty-eighth Street, New York, have organized Fairchild Aircraft, Ltd., with capital of $2,000,000 as Canadian subsidiary. Tract of about 265 acres has been acquired at Longueuil, near Montreal, as site for new plant, to include parts and assembling departments, to cost over $100,000 with equipment. Company will establish airport at same location, with hangars, repair shops and other units. Sherman H. Fairchild, head of parent company, will be president of subsidiary; Julian C. Smith is vice-president.

Kent Garage Investing Corporation, 350 Madison Avenue, New York, has awarded general contract to Fred T. Ley & Co., Inc., 578 Madison Avenue, for twenty-five-story automobile service, repair and garage building at Columbus Avenue and Sixty-first Street, to cost about $2,000,000 with equipment. Jardin, Hill & Murdock, 347 Madison Avenue, are architects.

Long Island State Park Commission, Babylon, L. I., will receive bids until July 26, for one 150-ft. steel standpipe, 300,000 gal. capacity, with skeleton steel frame support 175 ft. high. A. E. Howland is chief engineer.

Nichols Copper Co., 25 Broad Street, New York, is having plans drawn for three-story addition, 75 x 80 ft., to plant at Laurel Hill, Flushing, L. I., to cost over $75,000 with equipment. Leddy & Moore, 70 West Fortieth Street, New York, are architects.

Deppe-Merten Corporation, Long Island City, manufacturer of ventilating equipment, skylights, etc., has leased factory at 565 Boulevard for new plant.

Prudent Ice & Coal Co., Brooklyn, care of C. P. Cannella, 1162 Herkimer Street, architect, has asked bids on general contract for a one-story ice-manufacturing plant, to cost more than $100,000 with machinery.

Officials of International Projector Corporation, 90 Gold Street, New York, manufacturer of motion picture machines and parts, have organized General Theatres Equipment, Inc., to take over and expand that company together with a group of interests in kindred field, all specializing in production of projection lamps and other electric lighting equipment and devices. New organization will have combined assets of $67,000,000, and will arrange for early sale of block of stock, part of fund to be used for expansion of different units.

New York Steam Corporation, 280 Madison Avenue, New York, has awarded general contract to George A. Fuller Co., 949 Broadway, for three-story addition to power plant on Water Street 105 x 175 ft., and improvements in present station, to cost $250,000 with equipment.

Richardson Co., 2136 West Boulevard, Cleveland, manufacturer of battery boxes and equipment, is arranging for occupancy in August of plant of American Incubator Co., New Brunswick, N. J., recently acquired, and will carry out an expansion pogram to cost over $100,000. Initial works will total about 60,000 sq. ft. floor space. Cleveland works will be transferred to new site.

Metalkloth Co., Inc., Garibaldi Avenue, Lodi, N. J., manufacturer of filter cloth

products, has asked bids on general contract for one-story addition, to cost about $45,000 with equipment. Liebau & Breiby, 238 Main Street, Hackensack, N. J., are architects.

Allied Motor Industries, Inc., operating Great Lakes Aircraft Corporation, Cleveland, which recently took over plant in that city of Glenn L. Martin Co., has purchased controlling interest in American Cirrus Engines, Inc., 740 Washington Avenue, Belleville, N. J., manufacturer of aircraft motors under British patents, and will operate as unit. It is proposed to expand production of Cirrus engines and it is understood that plant may be removed to another location.

Delaware, Lackawanna & Western Coal Co., 120 Broadway, New York, has filed plans for new coal pockets and distributing plant at Jersey City, N. J., with conveying, loading and other equipment to cost $250,000.

Board of City Commissioners, 710 Bangs Avenue, Asbury Park, N. J., has awarded a general contract to DeRiso Brothers, Inc., 551 Fifth Avenue, New York, for a two-story power plant, for central heating service, to cost $397,000 with equipment. Warren & Wetmore, 16 East Forty-seventh Street, New York, are architects.

G. F. Machine Mfg. Corporation, 130 Bleecker Street, New York, recently organized to manufacture an iron lifter for ironing operations, is in market for gray iron castings, electric switches, wire, etc. Solomon Golub is president.

William H. Nicholls Co., Richmond Hill, N. Y., manufacturer of foundry equipment, has established two new offices, one at 341 West Sixteenth Street, Chicago Heights, Ill., in charge of S. H. Sutton, and another at 2842 West Grand Boulevard, Detroit, in charge of H. L. Ritz.

Michigan Seamless Tube Co., South Lyon, Mich., manufacturer of cold drawn seamless tubing, has appointed H. L. Wanderman, 1440 Broadway, New York, Eastern sales representative.

Herbert Kennedy Co., agent for Societe Anonyme des Hauts Fourneaux et Fonderies de Pont-a-Mousson, of Pont-a-Mousson, France, producer of cast iron bell and spigot pipe, has removed from 475 Fifth Avenue, New York, to Chanin Building, 122 East Forty-second Street. Offices of Intercontinental Pipe & Mining Co., which is building a plant at Chelsea, Mass., have also been moved to new address.

New England

BOSTON, July 15.—The closing on about $200,000 worth of tools by a Connecticut machine tool builder was the outstanding feature of the week. Another Connecticut tool builder has closed on a number of high-priced tools, and several other metal-working plants have placed orders for machines, deliveries extending into the last quarter of 1929. Local machine tool dealers did a fair business the past week, and received a sizable number of inquiries for one or more machines. Surface and internal grinders and lathes, ranging from bench type up to better than 36-in., are in demand in this territory. The city of Boston bought a shaper for a trade school and today closed bids on shapers, tool-room lathes and other equipment for the Mechanics Arts High School. About a dozen single-spindle drills were sold to eight plants.

The Crane Market

WITH both sales and inquiries light, quietness prevails in the crane market. Little important buying has been done this month, and companies which are considering the placing of orders are hesitant about closing. The dullness in the New York district reflects the usual seasonal decline, but this has been somewhat offset by a good volume of business reported from the Middle West. Crane builders continue very busy with no signs of a let-down in plant operations during the summer. A portion of the week's sales are listed below:

Pittsburgh Tube Co., Monaca, Pa., has bought one 5-ton, 100-ft. span electric overhead crane from Northern Engineering Works.

Cincinnati, New Orleans & Texas Pacific has purchased a maintenance-of-way crane from Orton Crane & Shovel Co.

George B. Limbert Co., East Chicago, Ind., has bought one 10-ton, 56-ft. span overhead electric crane from an unnamed bidder.

To speed up deliveries, some New England machine tool builders have temporarily discontinued production of certain types of equipment and are concentrating on the most active lines. The best delivery one Hartford tool builder can make on lathes is first quarter of 1930. Deliveries by New England grinding machine builders are gradually becoming more extended.

Used tool dealers are handicapped by a lack of machines. Business the past week was largely confined to foot presses, hack saws and other small tools.

Buying of small tools is more active and indications are that July sales may reach record proportions.

James Hunter Machine Co., 2 Main Street, North Adams, Mass., has awarded a contract for a machine shop addition.

Bullock Mfg. Associates, 46 Harrison Avenue, Springfield, Mass., manufacturers of tools, contemplate erection of a factory at West Springfield, to cost $30,000.

Liner-Atwill Co., 60 Bartholomew Avenue, Hartford, Conn., sheet metal, will close bids July 18 on one and two-story shop, 50 x 100 ft.

Columbia Airlines, Inc., Springfield, Mass., plans to start production of planes and motors about Sept. 1 at East Springfield. Outboard motors and motorcycles will be chief products. Charles A. Levine is president.

Marlboro Wire Goods Co., Marlboro, Mass., has started work on a plant addition.

Leonard Rooke Co., 486 Broad Street, Providence, manufacturer of valves, has awarded contract for a three-story addition, 60 x 100 ft.

Plantsville Foundry, Southington, Conn., capitalized for $50,000, has incorporated to do a general foundry and machine shop business. T. W. Thompson, Plantsville, Conn., is president.

Plans have been approved by Yale & Towne Mfg. Co., Canal and Market Streets, Stamford, Conn., for a one-story foundry addition, to cost $60,000 with equipment.

Warren Telechron Co., Ashland, Mass., manufacturer of bells, clocks and other electrical products, a subsidiary of General Electric Co., has plans for a two-story addition, to cost about $50,000 with equipment. Fay, Spofford & Thorndike, 44 School Street, Boston, are engineers.

American Brass Co., Waterbury, Conn., a subsidiary of Anaconda Copper Mining Co., 25 Broadway, New York, has purchased Randolph-Clowes Co., of same city, producer of kindred brass and copper specialties, and will consolidate.

Edison Electric Illuminating Co., 39 Boylston Street, Boston, has filed plans for a multi-story equipment storage and distributing plant, with repair facilities, to cost $120,000 with equipment.

Shell Eastern Petroleum Products Co., operated by Shell Union Oil Corporation, 65 Broadway, New York, has plans for a new storage and distributing plant at East Hartford, Conn., to cost about $100,000 with equipment.

Manning Mfg. Co., Rutland, Vt., manufacturer of creamery and dairy machinery, parts, etc., has awarded general contract to Mozzicato & Dipietro, 12 Hancock Street, Medford, Mass., for one-story and basement branch plant at Somerville, Mass., to cost about $45,000 with equipment.

Stamford Water Co., Summer Street, Stamford, Conn., has awarded general contract to Vuono Construction Co., 303 Main Street, for two-story mechanical shop, 55 x 90 ft., to cost about $35,000 with equipment.

Philadelphia

PHILADELPHIA, July 15.—Plans have been completed by I. Fischman & Sons, Tenth Street and Allegheny Avenue, Philadelphia, manufacturers of soda fountains and accessories, for one and two-story plant, to cost $1,500,000 with machinery. Clarence E. Wunder, 1520 Locust Street, is architect.

Proctor & Schwartz Electric Co., subsidiary of Proctor & Schwartz, Inc., Seventh Street and Tabor Road, manufacturer of drying machinery, air-conditioning equipment, etc., has awarded general contract to Wark Co., 1600 Walnut Street, for two-story plant on adjoining site, to cost $250,000 with equipment. Simon & Simon, Fidelity-Philadelphia Trust Building, are architects.

Philadelphia Steam Co., Forty-ninth Street and Grays Ferry Avenue, Philadelphia, recently formed by Edward H. Reuss, Jr., and associates, has applied for permission to take over under lease steam power plant of Pennsylvania Railroad Co., now in course of construction at Race and Thirtieth Streets, and to enlarge station about four times present size for central heating service to be furnished by company in area bounded by Broad, South and Fortieth Streets and Girard Avenue, for which franchise has been secured. Company will install pipe lines and system in district noted to cost $5,600,000, and is scheduling completion in November. Later, conduit system will be extended at cost of more than $10,000,000 additional. Mr. Reuss is president.

Daison Mfg. Co., Inc., 462 North Eighth Street, Philadelphia, manufacturer of lighting equipment, lamp shades, etc., has purchased four-story factory on site, 60 x 225 ft., at 2021-29 Naudain Street, for new plant. Increased output will be developed.

Hess-Bright Mfg. Co., Front Street and Erie Avenue, Philadelphia, manufacturer of ball bearings, has awarded general contract to F. V. Warren Co, 1913 Arch Street, for two additions, two stories, 60 x 122 ft., and one story, 60 x 140 ft., to cost about $100,000 with equipment.

Edward Board, Inc., 1641 North Twelfth Street, Philadelphia, has been organized

with capital of $30,000 to take over and expand plant and business at same address, heretofore operated under name of Edward Board, machinist. New company will design and manufacture special and standard machinery and parts. Mr. Board is president and treasurer.

Atlantic City Electric Co., Atlantic City, N. J., is planning construction of steel tower transmission line from new generating plant at Deep Water Point to Woodstown and Pleasantville, 57 miles, to cost more than $500,000.

Board of Education, Bridgeton, N. J., plans installation of manual training equipment in two-story junior high school to cost $425,000, for which bids will be asked on general contract in about 60 days. Edwards & Green, 548 Federal Street, Camden, N. J., are architects.

Hazle Brook Coal Co., Mount Carmel, Pa., has authorized immediate construction of electrically operated coal breaker at colliery near Mount Carmel, to cost about $1,000,000 with machinery.

Wire Fabrics Corporation, Mount Wolf, Pa., manufacturer of wire cloth and other wire goods, has awarded general contract to L. M. Klunk, 205 South George Street, York, Pa., for two-story addition, to cost about $40,000 with equipment.

Transmission Engineering Co., Provident Trust Building, Philadelphia, has been organized by L. H. Shingle and associates to specialize in power transmission problems. Mr. Shingle is treasurer of Power Transmission Association.

Specialty Metal Products Co., Inc., 539 Diamond Street, Philadelphia, is engaged in manufacture of sheet metal stampings and will also do machine work on contract.

South Atlantic

BALTIMORE, July 15.—Plans are under way by Levering Brothers, Inc., 200 Key Highway, Baltimore, manufacturer of sash weights and other iron castings, for one and two-story branch foundry at Hanover, Pa., to cost over $80,000 with equipment.

Maryland Airport Corporation, Cumberland, Md., recently formed with capital of $100,000 by John G. Wiebel, La Vale Street, and associates, will establish an airport at Pinto Road and McMullen Highway, where property has been secured. Project will include hangars, repair shops, oil storage and other buildings, to cost more than $65,000 with equipment. Mr. Wiebel will be secretary and treasurer.

American Radiator & Standard Sanitary Corporation, 40 West Fortieth Street, New York, is concluding negotiations for purchase of Campbell Metal Window Corporation, Baltimore, manufacturer of steel and metal windows and sash for office buildings, etc. It is proposed to increase output at Campbell plant, particularly in specially designed metal window with sill to accommodate new type of radiator to be hung directly from sill.

Sylvania Industrial Corporation, Fredericksburg, Va., recently organized with capital of $3,500,000, has acquired local property for new plant to manufacture industrial chemicals and kindred products, to cost over $250,000 with equipment.

Richfield Oil Corporation, Whitehall Building, New York, subsidiary of Richfield Oil Co., of California, Inc., Los Angeles, has acquired 40-acres in Curtis Bay district, Baltimore, and plans construction of new storage and distributing plant, with power house, pumping station and other units, to cost more than $150,000 with equipment. John B. Stein, Woolworth Building, New York, is engineer.

Board of District Commissioners, District Building, Washington, will soon take bids for one-story mechanical and repair shop at Bryant Street pumping station, to cost $50,000 with equipment. A. L. Harris, address noted, is municipal architect. Bids will also be asked about same time for one and two-story automobile service, repair and garage building for highway department on adjoining site, to cost about $170,000 with equipment.

City Council, High Point, N. C., is said to be planning construction of a municipal electric light and power plant, to cost about $50,000 with equipment.

Atlanta Gas Light Co., Atlanta, Ga., has awarded general contract to United Construction Co., Inc., Georgia Savings Bank Building, for one-story equipment storage and distributing plant, with repair department, 115 x 300 ft., to cost about $100,000 with equipment; also for one-story automobile service, repair and garage building, 60 x 120 ft., at same location for company motor trucks and cars. George Kollock is company engineer.

Champion Fibre Co., Canton, N. C., is reported considering construction of a new paper mill at Tuscaloosa, Ala., and has taken options on site. Project will cost over $200,000 including machinery.

Palmer & Lambdin, 513 North Charles Street, Baltimore, architects, are asking bids on general contract for five-story automobile service, repair and garage building, 60 x 185 ft., to cost more than $175,000 with equipment.

Board of Trustees, Western Carolina Teachers' College, Cullowhee, N. C., has engaged Charles E. Waddell, Jackson Building, Asheville, N. C., engineer, to prepare plans for a hydroelectric power plant on Tuckaseegee River, to cost more than $100,000 with equipment.

Buffalo

BUFFALO, July 15.—Work is under way by Sun Oil Co., Philadelphia, and 2246 Niagara Street, Buffalo, on storage and distributing plant near Kenmore, Tonawanda Township, to cost $240,000. Project will include automobile service and garage building for company motor trucks.

New York State Electric Corporation, 123 Cayuga Street, Ithaca, N. Y., is reported planning new steam-operated electric power plant at Carmel, N. Y., to cost more than $85,000.

Marcellus Casket Co., Van Rensselaer Street, Syracuse, N. Y., has plans for four-story addition, to cost more than $90,000 with equipment. M. L. King, Dennison Building, is architect.

Buffalo Foundry & Machine Co., 1543 Fillmore Avenue, Buffalo, will build a one-story addition, to cost about $25,000 with equipment.

Schroon River Pulp & Paper Co., Warrensburg, N. Y., will carry out an expansion program, including installation of new machinery in pulp wood and other departments and modernizing of present equipment, to cost over $40,000. Walter Carr is in charge.

National Magnetic Clock Corporation, Buffalo, recently organized by Edwin S. Burrows, 136 Lancaster Avenue, and associates, with capital of $25,000, plans operation of local factory to manufacture special magnetic clocks and clock mechanisms.

Aero Corporation of America, Inc., organized under Delaware laws, will take over and consolidate Covert Gear & Mfg. Co., Lockport, N. Y., and Simplex Aircraft Corporation, Defiance, Ohio. Expansion is planned. E. J. Allen and Alwin A. Gloetzner, presidents of Simplex and Covert companies, respectively, are identified with new organization.

Breuil & Bennett Fuel Oil Co., Ellicott Square, Buffalo, is planning new storage and distributing plant near Kenmore, to cost about $100,000 with equipment.

Pittsburgh

PITTSBURGH, July 15.—Following a few days of comparative quiet, occasioned by the Fourth of July holiday, the machinery trade has resumed the activity which prevailed during June and this month promises to be considerably above the average for this time of year. A number of tools have been placed and a favorable factor is fresh inquiries of sizable volume. One new list includes 10 tools and another six, while several call for single items. The Westinghouse Electric & Mfg. Co., has not yet begun to close against its third quarter list, but requirements indicate that heavy purchases against this list will continue throughout the quarter.

It is expected that the list for the new A. M. Byers Co. plant at Ambridge, Pa., will be out in about a month and the requirements of the Bethlehem Steel Co. for expansion at Johnstown will probably be announced at about the same time.

Although July and August are usually rather quiet months in the machinery business because of the vacation periods of executives, it is thought that the placing of tools will see little interruption this year.

Blair Strip Steel Co., New Castle, Pa., will build a one-story addition, 115 x 125 ft., to cost about $100,000 with equipment.

Pittsburgh Tube Co., Vandergrift Building, Pittsburgh, has plans for two additions, each one story, 60 x 420 ft. and 105 x 240 ft., to double present capacity. Installation will include two or more traveling cranes. Project is reported to cost more than $175,000 with equipment. C. O. Spillman is general superintendent.

Standard Steel Propeller Corporation, Homestead, Pa., has work under way on expansion at local mill to increase output from three to four times present rating of 350 propellers per month. Work will cost more than $100,000.

Lone Star Gas Corporation, Farmers' Bank Building, Pittsburgh, operating natural gas properties in Texas and other Southern States, has arranged for increase in capital from 2,000,000 to 7,000,000 shares of stock, no par value, part of fund to be used for expansion.

Lawrence Motor Co., Mercer Street, New Castle, Pa., has awarded general contract to Hoyland & Frasso, 411 Leasure Street, for four-story service, repair and garage building, to cost $140,000 with equipment. W. C. Eckles Co., Lawrence Savings & Loan Building, is architect.

West Virginia Coal & Coke Corporation, Huntington, W. Va., has been organized with capital of $2,400,000, to take over and expand West Virginia Coal & Coke Co., with properties in Elkins, Bower and Logan Counties, in receivership. New organization is arranging for bond issue of $2,000,000 and sale of 48,000 shares of stock, of which about $1,000,000 will be used for extensions and improve-

ments in mines, including installation of electrically-operated machinery, remodeling and improving of tipples, plants for coal sorting and preparation, conveying and hauling facilities, etc. John C. Cosgrove, one of receivers for former company, will be president of new corporation; A. H. Crane will continue as secretary and treasurer.

Kittanning Limestone Co., Kittanning, Pa., has changed name to Kittanning Cement & Limestone Co., and plans expansion, including construction of cement mill, building of dock 2500 ft. long, extensions in conveying, distributing and storage facilities, etc., to cost more than $600,000.

Detroit

DETROIT, July 15.—Contract has been let by Culver-Stearns Mfg. Co., 3513 Woodward Avenue, Detroit, manufacturer of automobile parts, lighting equipment, etc., to Beyster & Olmstead, General Motors Building, for two-story plant unit, to cost about $50,000 with equipment. J. Ivan Dise, McKerchey Building, is architect.

Board of Trustees, Detroit House of Correction, Detroit, is having plans drawn for power house for new group of buildings at Plymouth, Mich., entire project to cost more than $200,000. Albert Kahn, Inc., Marquette Building, is architect and engineer.

Excell-O Aircraft & Tool Corporation, 1469 East Grand Boulevard, Detroit, recently organized to take over and operate Excell-O Tool & Mfg. Co., same address, has plans under way for expansion, primarily to increase facilities for manufacture of aircraft parts and specialties. Company has arranged for stock issue to total $940,000, considerable part of fund to be used for purpose noted.

Kunkel Mfg. Co., Hart, Mich., manufacturer of automobile heaters, valve grinding tools, etc., is erecting one-story addition, to cost about $40,000 with equipment.

Streng-Chevrolet Co., 8510 Twelfth Street, Detroit, A. B. Streng, president, representative for Chevrolet automobile, has awarded general contract to Downey & Davis, Fisher Building, for three and four-story service, repair and garage building, to cost about $150,000, with equipment. Andrew Morrison, 2231 Park Avenue, is architect.

Crosby-Ross Window Equipment Corporation, Ann Arbor, Mich., recently organized with capital of $100,000 has taken over plants and properties of Crosby Mfg. Co., Ypsilanti, Mich., manufacturer of screens, window sash, etc., and Frederickson-Williamsen Co., Detroit, manufacturer of invertible window hardware, and will consolidate. Former plant at Ann Arbor of Orange Crush Co. has been purchased and will be remodeled to manufacture invertible window hardware, screens, storm sash, etc. I. E. D. Ross, Detroit, is president, and William M. Laird, Ann Arbor, treasurer.

Detroit Aircraft Corporation, Detroit, has arranged for purchase of controlling interest in Lockheed Aircraft Corporation, Los Angeles, and will be active in management. It is proposed to carry out an expansion program at last noted plant, to cost over $75,000 with equipment.

Schermack Corporation, 1164 West Baltimore Avenue, Detroit, manufacturer of vending machines and parts, is planning new units to cost over $250,000 with equipment. Albert Wood, 2111 Woodward Avenue, is architect.

Sherrill Ambler, Northville, Mich., has purchased local plant and property of American Bell & Foundry Co., consisting of about 4½ acres improved with one-story buildings totaling about an acre of floor space. New owner will continue production as heretofore, and plans development of Bell furnace division of business with increase in foundry output.

Chicago

CHICAGO, July 15.—Reports of activity in the local machine tool market vary, some dealers finding July sales equal to those in June, while others report sales less than in the previous month. New purchases in the last week were in moderate volume and from widely scattered sources. Large buyers, though having in mind needs for the future, are slow in making their wants known.

Progress is being made on lists for several farm machinery manufacturers, but there is a growing impression that definite action will not be taken until early fall. Dealers' unfilled orders are large and deliveries are improving slowly. Complaint is frequently heard that railroad cars, suitable for loading some types of machinery, are at times difficult to obtain. The used tool market remains active.

Chicago Screw Co., 1026 South Homan Avenue, Chicago, will build a four-story addition to machine shop, 70 x 124 ft. J. B. Fisher, 140 South Dearborn Street, is architect.

Comandor Furnace Co., Vandalia, Ill., is erecting a new building, 56 x 240 ft., which will provide about 14,000 sq. ft. of additional manufacturing space.

Contract has been let by W. H. Salisbury Co., 401-21 Morgan Street, Chicago, manufacturer of rubber products, to Rune & Son, 6753 Stony Island Avenue, for one and two-story additions, 116 x 125 ft., to cost about $120,000 with equipment. Albert P. Dippold, 3948 Cottage Grove Avenue, is architect.

B. Mercil & Sons Plating Co., 1921 Fulton Street, Chicago, has awarded general contract to Chicago Industrial Construction Co., 53 West Jackson Boulevard, for one-story addition, 100 x 121 ft. A 30-ft. span traveling crane will be installed. Expansion will cost more than $70,000 with equipment.

Minnesota Mining & Mfg. Co., Forest and Fauquier Streets, St. Paul, Minn., manufacturer of abrasive materials, mining specialties, etc., is asking bids on general contract for a two-story and basement addition, to cost about $150,000 with equipment. Toltz, King & Day, Inc., Builders' Exchange Building, is architect and engineer.

American Beet Sugar Co., Steel Building, Denver, has plans for a one-story addition to mill at Rocky Ford, Colo., 40 x 145 ft., to cost about $85,000 with equipment.

Rath Packing Co., Elm and Sycamore Streets, Waterloo, Iowa, meat packer, has plans for six-story addition, to cost about $250,000 with conveying, refrigerating and other equipment. Henschien & McLaren, 1637 Prairie Avenue, Chicago, are architects and engineers.

Burst-Harig Mfg. Co., 1735 Carroll Avenue, Chicago, recently organized to manufacture tools, dies, etc., is completing a one-story machine shop, to cost about $30,000 with equipment.

R. H. Buhrke Co., 4540 Fullerton Avenue, Chicago, manufacturer of golf sticks, irons, etc., has awarded general contract to C. S. Miller, 5338 North Spaulding Avenue, for two-story plant, 100 x 125 ft., to cost about $65,000 with equipment. A. V. Teisen Co., 4804 North Kedzie Avenue, is architect.

Englander Spring Bed Co., 3943 Lowe Street, Chicago, is planning to rebuild part of plant recently destroyed by fire. Headquarters are at Johnson and Stewart Avenues, Brooklyn, N. Y.

Electric Household Utilities Corporation, West Twenty-second Street and South Fifty-fourth Avenue, Cicero, Ill., has begun construction of one-story foundry, to cost more than $50,000 with equipment. Present foundry at Waukegan, Ill., will be removed to new building early in September, with installation of additional equipment.

Half interest in Chamberlain Machine Works, Waterloo, Iowa, manufacturer of clothes wringers, has been sold to Studebaker Securities Co. Company has been reorganized as Chamberlain Corporation and plans are under way for a new factory, 100 x 200 ft., with another unit, 150 x 300 ft., contemplated for next spring. F. L. Chamberlain, who has been head, remains as president; Col. George M. Studebaker is treasurer, and C. M. Sherrill, secretary.

International Harvester Co., Chicago, has plans for a new plant, 230 x 620 ft., and a two-story addition to its recently completed motor manufacturing unit at its Farmall tractor plant at Rock Island, Ill., entire project to cost about $1,000,000.

Milwaukee

MILWAUKEE, July 15.—Machine tool manufacturers still are far behind on deliveries, but there is a general feeling that the peak has been passed. Inquiries from railroads are increasing. Orders from automotive manufacturers have not receded and demand from other sources continues good, although there are signs of relaxation in some quarters.

Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., maker of drilling and milling machines, horizontal boring machines, etc., has contracted with Immel Construction Co., Fond du Lac, for one-story addition to machine shop, 90 x 250 ft., to cost $100,000 including equipment. Austin Co., Cleveland, is engineer.

University of Wisconsin, Madison, will close bids Aug. 6 for the construction of the mechanical engineering building for which $577,000 has been appropriated. Building will be irregular in shape, 230 x 250 ft., three stories. Bids are to be sent to J. D. Phillips, business manager of university. Plans are by Arthur Peabody, State architect.

Central Brass Foundry Co., Neenah, Wis., recently organized by A. M. Schnetzer, superintendent of Neenah Brass Works for fifteen years, and John W. Hewitt, one of owners of Hewitt Machine Co., Neenah, will open a new foundry at Menasha, Wis., specializing largely in jobbing work on paper and sulphite mill machinery. Mr. Schnetzer has disposed of his interest in the Neenah Brass Works, and will be in active charge of the new company.

Rock County Clerk, Janesville, Wis., will take bids until July 20 for construction of a machine shop, garage and warehouse, 50 x 200 ft., for servicing and

storing road-making and maintenance equipment. Charles E. Moore is County highway commissioner.

Milwaukee Electric Railway & Light Co., 217 Michigan Street, Milwaukee, has started excavation for addition to Cold Spring Avenue car repair and service shop, 164 x 292 ft., to cost $100,000. R. H. Pinkley is in charge.

Acme Metal & Scrap Iron Co., 497 Virginia Street, Milwaukee, will build a plant and refinery addition, 45 x 110 ft.

Cincinnati

CINCINNATI, July 15.—Fresh bookings for machine tools declined the past week, but manufacturers report sufficient unfilled orders to maintain production at a good rate throughout the summer. Demand is chiefly for standard tools and is coming from a wide source, which tends to offset the decrease caused by the withdrawal of automobile manufacturers from the market pending development of new models. The Chicago, Burlington & Quincy Railroad has placed an order with a local manufacturer for four motor-driven lathes.

Foreign business has declined sharply, although interest was revived last week when several machine tool makers received requests from a Russian commission, which had been in this market for several months, for additional information.

Plans are under way by Emery Industries, Inc., June and Long Streets, Ivorydale, Cincinnati, for one-story power plant, to use pulverized fuel, to cost over $75,000 with equipment. Kinney & Ehlers, Inc., Dixie Terminal Building, is consulting engineer.

C. O. Sherrill, City Hall, Cincinnati, city manager, has awarded general contract to William Miller & Son, 1952 Central Parkway, for hangar at municipal Lunken Airport, with shop and repair facilities, to cost $61,000. Kruckemeyer & Strong, St. Paul Building, are architects.

Board of Education, Sidney, Ohio, is said to be planning installation of manual training equipment in two-story high school addition to cost $250,000, for which plans will be drawn by H. L. Loudenback & Son, Kah Building, architects.

City Council, Murfreesboro, Tenn., plans installation of elevated steel tank and tower, with capacity of about 500,000 gal., in connection with extensions and improvements in municipal waterworks to cost $300,000, for which bonds have been approved. J. B. Farmer is superintendent in charge.

Absopure Refrigerator Corporation, Louisville, recently formed by David A. Brown, Louisville, and associates, has taken over Vogt Refrigerator Co., with local plant, manufacturer of metal refrigerators and equipment, and Absopure Refrigerator Co., Detroit, manufacturer of electric refrigerating units and accessories, and will consolidate. Output will be increased. Both companies were formerly operated as divisions of General Necessities Corporation, 2011 Park Avenue, Detroit. Mr. Brown will be president of consolidated company.

Formica Insulation Co., 4614 Spring Grove Avenue, Cincinnati, manufacturer of laminated insulating products, has taken out a permit for multi-story addition, to cost $100,000 with equipment, for which general contract recently was let to Ferro Concrete Construction Co., Third and Elm Streets.

Board of Education, Delaware, Ohio, is said to be planning installation of manual training equipment in two-story high school to cost about $500,000, for which bids are being asked on general contract until July 25. Glass-Ramsey, Inc., 186 East Broad Street, Columbus, Ohio, is architect.

Girdler Corporation, Goss Avenue and Shelby Street, Louisville, recently organized to take over and consolidate local group of companies manufacturing ice cream freezers, freezing machinery, etc., will make extensions and improvements in four-story factory at location noted. Plans are also under way for a new unit, to cost more than $50,000 with equipment. Walter H. Girdler is president.

Indiana

INDIANAPOLIS, July 15.—Contract has been let by Board of Trustees, Purdue University, Lafayette, to Glenn W. North Construction Co., Terre Haute, for first unit of mechanical engineering building at West Lafayette, to cost $150,000 with equipment. Walter Scholer, Painters' and Decorators' Building, Lafayette, is architect.

Grapho-Metal Packing Co., 2232 Alvord Street, Indianapolis, manufacturer of metallic packing, has purchased plant and business of Detroit Replacement Service Inc., 2559 Bellevue Street, Detroit, manufacturer of water pumps, starting cranks and kindred products, and will consolidate. Detroit plant will be removed to Indianapolis where expansion will be carried out. Albert D. Smith is president.

George B. Limbert & Co., 570 Fulton Street, Chicago, manufacturers of iron pipe, steamfitters' supplies and kindred products, have awarded general contract to H. B. Olney, 1200 East Chicago Avenue, East Chicago, Ind., for extensions and improvements in branch plant at East Chicago, to cost about $35,000. Briggs & Almy, 608 South Dearborn Street, Chicago, are engineers.

Automatic Screw Products Corporation, Indianapolis, recently organized by A. J. Vondersaar, 2021 Hoyt Avenue, and associates, has leased 10,000 sq. ft. in building at Nineteenth Street and Martindale Avenue, and will establish plant for second operation work on screw machine products.

Citizens' Gas Co., 47 South Penn Avenue, Indianapolis, is planning extensions and improvements in artificial gas plant, including installation of gas compressor units and auxiliaries, ovens and by-products equipment, and other machinery, to cost about $800,000.

Cleveland

CLEVELAND, July 15.—Machine tool sales by dealers were rather light the past week and not much new inquiry developed. The Packard Motor Car Co., Detroit, purchased a few tools to manufacture Diesel engines for airplanes and has a number of additional machines on its list of requirements. Another Michigan automobile manufacturer is figuring on some additional equipment. Sales by a local manufacturer of lathes continue good, its business so far this month equaling that during the same period in June. This company reports a good foreign demand from England and France. While machine tool deliveries are easier, the improvement on most lines is only slight.

Contract has been let by Cleveland Institute of Aviation, Society for Savings Building, Cleveland, to Gilchrist Construction Co., Western Reserve Building, for hangar, 120 x 145 ft., with repair facilities, and building, 40 x 120 ft., at proposed airport and training field, to cost $80,000 with equipment.

William R. Hopkins, City Hall, Cleveland, city manager, has plans for one-story municipal automobile service, repair and garage building, to cost about $100,000 with equipment. Herman Kregelius, City Hall, is city architect in charge.

Standard Oil Co., Toledo, Ohio, plans rebuilding part of oil storage and distributing plant destroyed by fire July 4.

Ohio Piston Co., 5337 St. Clair Avenue, Cleveland, has plans for one-story addition, to cost about $50,000 with equipment. Kalsch & Hoefler, 4500 Euclid Avenue, are architects.

Rainbow Luminous Products, Inc., operating Rainbow Light, Inc., 21-43 Forty-fourth Road, Long Island City, manufacturer of electric tube lighting equipment, has purchased Central Outdoor Advertising Co., 1124 Carnegie Avenue, Cleveland, recently formed by merger of General Outdoor Advertising Co., address noted, and Harry H. Packer Co., 2420 West Superior Street, same city, manufacturer of electric signs, displays, etc. Purchasing company will consolidate into single operating unit, and plans expansion. George L. Johnson is chairman of board of Rainbow organization.

Cleveland Chain & Mfg. Co., Pennsylvania Railroad and Henry Street, Cleveland, manufacturer of steel chains, chain hooks, etc., has plans for one-story addition, 45 x 100 ft., to cost about $50,000 with equipment.

Piqua Electric Mfg. Co., Piqua, Ohio, has been incorporated, and has engaged in manufacture of electric fans, especially for exhaust and ventilating purposes. Company is contemplating building a new plant within the next year.

Gulf States

BIRMINGHAM, July 15.—Expansion will be carried out at Dallas, Tex., by Fairchild Aviation Corporation, 270 West Thirty-eighth Street, New York. A new hangar with shop and repair facilities will be constructed at Love Field, and other units established, to cost $75,000 with equipment. Stanley Moir is local manager.

Southern Sugar Co., Clewiston, Fla., has work under way on expansion program, to include installation of conveying, grinding and other equipment, to cost more than $600,000. Work is scheduled for completion in December. W. G. Ames is company construction engineer in charge. Headquarters are at 645 North Michigan Avenue, Chicago. B. G. Dahlberg is president.

Bent Concrete Pipe Co., Forth Worth, Tex., manufacturer of large diameter steel-reinforced concrete pipe, with headquarters in Grosse Building, Los Angeles, has acquired 10-acre tract at West Dallas, Tex., as site for new plant, to cost over $700,000 with machinery.

Uniheart Universal Tool Co., Muscle Shoals City, near Sheffield, Ala., recently organized, has established a local plant to manufacture a patented tool holder, with drop forging, finishing and other departments.

John Deere & Co., Moline, Ill., manufacturer of plows and other agricultural machinery, has asked bids on general contract for a three-story and basement factory branch and distributing plant, 116 x 120 ft., at San Antonio, Tex., to cost over $75,000 with equipment. O. E. Eckerman, Moline, is architect. Clark E. Inglish, 311 South Flores Street, San Antonio, is local manager.

R. W. Alfred, 120 West Craig Street, San Antonio, Tex., and associates are planning new ice-manufacturing plant at Mercedes, Tex., to cost about $85,000 with equipment.

Tobian Garage, Inc., Dallas, Tex., has purchased four-story building and will remodel for new service, repair and garage building, to cost $150,000, exclusive of puchase price. Company is operated by William Tobian.

Board of Education, Birmingham, has authorized installation of manual training shops in first unit of new West End high school, to cost more than $400,000 with equipment. Plans have also been approved for two-story unit at industrial high school for negroes. Warren, Knight & Davis, Protective Life Building, are architects.

St. Louis

ST. LOUIS, July 15.—Plans are being considered by Prest-o-Lite Co., 30 East Forty-second Street, New York, manufacturer of acetylene equipment, welding apparatus, etc., for branch plant at Oklahoma City, Okla., consisting of two one-story units, 60 x 131 ft., and 50 x 60 ft., to cost about $100,000 with equipment.

Terminal Railroad Association, 1800 Market Street, St. Louis, has filed plans for one-story shop and equipment storage building, 45 x 175 ft., to cost about $55,000 with equipment.

Schmidt, Boucher & Overend, Brown Building, Wichita, Kan., architects, have awarded general contract to Blaser-Vollmer, Inc., 430 North Rock Island Avenue, for three-story and basement automobile service, repair and garage building, 74 x 145 ft., to cost about $100,000 with equipment.

Pierce Petroleum Corporation, 1329 Gratiot Street, St. Louis, has awarded general contract to Fruin-Colnon Contracting Co., Merchants Laclede Building, for one-story storage and distributing plant, 70 x 119 ft., to cost about $45,000 with equipment. H. L. Denning is company architect, address noted.

National Supply Co., 9 South Main Street, Tulsa, Okla., oil and gas well equipment and supplies, has awarded general contract to W. H. Horster, Exchange National Bank Building, for three-story storage and distributing plant, with pipe and fitting departments, etc., 75 x 125 ft., to cost about $75,000 with equipment. A. M. Atkinson, Mid-Continent Building, is architect.

New Era Motors, Inc., care of J. E. Roberts, 17 East Forty-fifth Street, New York, recently organized to manufacture an eight-cylinder front drive automobile, to be known as Ruxton automobile, has leased property at St. Louis for temporary plant pending construction of a new plant at Detroit. Both parts production and assembling departments will be provided. A. M. Andrews is president; and Fred D. Peabody, formerly assistant sales manager of Hupp Motor Car Corporation, Detroit, sales manager.

Sparton Aircraft Co., Tulsa, Okla., has work under way on an expansion program for production of cabin aircraft, airmail transport and training airplanes. Company is a subsidiary of Skelly Oil Co., Tulsa.

Pacific Coast

SAN FRANCISCO, July 11.—American Foundry Co., Bay Point (Contra Costa County), Cal., has purchased plant property of Dow Pump & Diesel Engine Co., Alameda, Cal., and will remove to that location, with installation of additional equipment. A. Searle is general manager.

Bates Valve Bag Co., 2001 East Fifty-seventh Street, Los Angeles, has plans for one-story plant, 170 x 360 ft., to cost over $100,000 with machinery. Austin Co. of California, Inc., is engineer. Headquarters are at 35 East Wacker Drive, Chicago.

Cudahy Packing Co., 803 Macy Street, Los Angeles, has awarded general contract to Pozzo Construction Co., 421 Macy Street, for three additions to meat-packing plant, to cost more than $100,000 with equipment; a three-story unit will be built for lard refining. Company engineering department, Omaha, Neb., is in charge.

Oil Well Mfg. Co., 6040 Alameda Street, Huntington Park, Cal., manufacturer of oil well equipment and supplies, has plans for a one-story addition, 70 x 140 ft., including improvements in present plant, to cost over $40,000 with equipment. A. Godfrey Bailey, Hillcrest Building, is architect.

Utah Power & Light Co., Kearns Building, Salt Lake City, has plans for a two-story addition to steam-operated electric power plant, to cost $250,000 with equipment. Company is operated under direction of Electric Bond & Share Co., 2 Rector Street, New York.

Jessie J. Ward, city clerk, Centralia, Wash., will receive bids until Aug. 13 for equipment for a municipal electric light and power plant, including two 2900-hp. hydraulic turbines; two 2500-kva. electric generators; eight 1667-kva. transformers, and auxiliary equipment.

Aircraft Plywood Corporation, Seattle, recently organized, has acquired former local plant of Gould Lumber Co. for new works. Expansion will be carried out to provide for production of 200,000 ft. plywood per day for aircraft industry. Company is said to be arranging sale of stock issue under direction of First Securities Co., Seattle, part of fund to be used for purpose noted.

Pacific Mill & Mine Supply Co., 1122 Santa Fe Avenue, Los Angeles, has awarded general contract to John M. Cooper Co., Inc., Rives-Strong Building, for one-story storage and distributing plant, 40 x 160 ft., to cost about $30,000 with equipment.

Canada

TORONTO, July 15.—While there has been a falling off in machine tool sales in this market, local builders and dealers look upon the decline as seasonal, rather than as an indication of a recession in business. Current demand, while below that of a couple of months ago, is on a more substantial basis than for the corresponding period last year. Inquiries for single tools are in fairly good volume. Small tools are moving freely.

R. S. Hart, manager of National Steel Car Co., Hamilton, Ont., has acquired plant formerly occupied by Carbon & Alloy Steels, Ltd., Welland, Ont., and has awarded contract to Gardner Construction Co., for remodeling. A new company, to be known as National Steels, Ltd., will operate works.

Lionite Abrasive Co., subsidiary of General Abrasive Co., Niagara Falls, N. Y., will start work at once on erection of a plant in Stamford township, near Niagara Falls, Ont., to cost $150,000.

An agreement between Simcoe, Ont., Board of Education and American Can Co., has been approved by Town Council, whereby former Central school property passes to can company for $35,000. This is understood to be initial step in establishing a can manufacturing plant to ultimately cost $1,000,000.

Bids are being received by W. A. Pearse, business administrator of Board of Education, 155 College Street, Toronto, for lathes and other machinery for installation in Western Branch, Technical High School.

Guelph Stove Co., Guelph, Ont., has taken out a permit for an addition, to cost $115,000.

Auto Strop Safety Razor Co., 83 Duke Street, Toronto, will build an addition to cost $50,000.

City of Hull, Que., will spend $100,000 on construction of waterworks plant, including purchase of pumping units, etc. Leo Lancetot, City Hall, is engineer.

Canadian Oil Companies, Ltd., 2 Strachan Avenue, Toronto, contemplates building an addition and erection of new storage tanks at Petrolia, Ont.

Toronto, Hamilton & Buffalo Railway Co., has awarded several contracts for roundhouse repair shops at Hamilton, Ont., to cost $850,000.

Robert Mitchell Co., 750 Belaire Street, St. Laurent, Que., has awarded contract to Anglin-Norcross, Ltd., 2063 Victoria Avenue, Montreal, for a foundry to cost $500,000. T. Pringle & Sons, Ltd., 410 St. Nicholas Street, Montreal, is architect.

Jeffrey Mfg. Co., 1111 Beaver Hall Hill, Montreal, has awarded general contract to A. F. Byers & Co., Ltd., for a factory at Ville La Salle, Que.

Foreign

OFFICIALS of Petroleum Heat & Power Co., 511 Fifth Avenue, New York, manufacturer of oil burners and oil-burning equipment, are planning organization of subsidiary to operate in France. It is proposed to establish a plant in that country for complete distributing and servicing facilities. Project is reported to cost over $1,000,000. William C. McTarnahan, president, has gone abroad to complete details.

Government of Russia, through Amtorg Trading Corporation, 261 Fifth Avenue, New York, official buying agency for Soviet Russian Government, has arranged with Lockwood Greene Engineers, Inc., 1 Pershing Square, New York, and Boston, architect and engineer, to reorganize and reconstruct textile mills in Soviet Union, including design and construction of new plants covering all branches of production. A five-year program has been ratified, providing a capital investment of about $700,000,000 for textile industry during that period, and which is estimated will more than double present output. Announcement has been made by both interests noted that a large part of machinery and equipment requirements will be purchased in United States.

THE IRON AGE

New York, July 25, 1929

ESTABLISHED 1855 VOL. 124, No. 4

Universal Apprenticeship Essential

Shortage of Skilled Mechanics Cannot Be Overcome So Long as Common Duty of Training Younger Generation Is Shirked

BY HAROLD S. FALK*

THE man who works is the most important factor in the industrial world. An abandoned factory, with crumbling walls, sagging roof, windows broken and doors off the hinges, is excellent evidence that industry without men is worse than useless. Up-to-date equipment, efficient accounting systems, strong financial foundation, advantageous location, loyal and satisfied customers—all these are futile without a strong organization of men who know their work.

Manufacturers and business people have gradually come to realize this important fact and are devoting more and more thought to matters of personnel. Business men who are confronted with more problems than they can take care of have asked themselves why they should not train assistants to help them with these problems. This thought naturally enough suggested another—that if an organization is efficient, it will not present so many problems in the first place, and in the second place will include a great number of men, even in subordinate positions, who can solve their own problems long before they reach the head of the business.

General Lack of Interest in Apprenticeship

Accordingly, there has grown up in the last few years a very considerable development of personnel work in industry. Employment departments have been set up for careful and sometimes scientific selection of workers; the work and habits of men are analyzed and recorded to find for each one the task for which he is best fitted; shop committees have been appointed for safety, for the adjustment of disputes, for improvement in processes and for other purposes; insurance and pension features have been provided; hospitals have been established; working conditions have been improved; training courses for young engineers, for salesmen, for foremen and for office workers, as well as other educational advantages, are available in many industries.

It is a curious fact that in spite of all this there is a general lack of interest in apprentice training among American business men. Of course, there are exceptions. Here and there may be found organizations, especially among the railroads, in the machinery building industry

PATTERN Apprenticeship Is the Oldest Branch of Apprentice Training in the Falk Shop and None Is Better Organized

*Vice-president and works manager, Falk Corporation, Milwaukee.

and in the building trades, in which thorough programs of apprentice training have been arranged. However, the great majority of our employers seem to think that all necessary men can be hired when needed, or they do not think about the matter at all.

Prevalent Opinion that Modern Mechanical Industry Requires No Skill

Some time ago I spoke before a group of foundrymen on the subject of apprentice training. During the informal discussion that followed the talk, one of the foundry operators stated that his plant was on a production basis and that all his castings were made on molding machines which were automatic and practically fool-proof. He stated that modern machinery dispenses with skilled mechanics, that he had no need for them in his plant and did not want any. This is merely an example of the far

FOUNDRY Apprentices and Certain Machine Shop Apprentices Are Given Several Months' Training in a Heat-Treating Shop, Not with the Idea of Making Them Skilled in Heat Treating Steel, but to Teach Them to Appreciate What May Be Done in Changing the Properties and Characteristics of Steel

too prevalent opinion that trained men are not required in modern mechanical manufacturing.

The following answer to the argument is from an article which recently appeared in a well-known trade publication:

"Managers of automobile plants have been known to say that they want nothing except men who can be taught a mechanical operation and are willing to stay at it indefinitely. But where do such managers obtain their superintendents, their foremen and inspectors? Who is there to show the mechanical operators what to do and how they are to do it? Mechanics are necessary in production industries to take care of the maintenance of machinery and to set it up in the first place. Skilled men of the highest class are required to plan and to make the tools and fixtures that make production work possible. Only highly trained men can plan the routing of work, the placing of machines and the proper arrangement and correlation of various departments."

It may be true that the proportion of skilled mechanics required in mass production is smaller than in the old-fashioned manufacturing methods, but the production industries have expanded so much that the actual number of mechanics required is probably greater than ever before.

Moreover, it must not be forgotten that there are important and extensive industries that do not readily lend themselves to mass production methods. For instance, we do not expect to find any considerable number of unskilled men on line assembly and machine operations in the manufacture of locomotives, passenger cars, boilers and turbines for public service corporations, furnaces, cars and rolls for the steel industry, printing presses, machinery for vessels, equipment for food and chemical industries and water turbines. Such products will continue for years to be built as individual units rather than by thousands along an assembly line and, hence, in those industries, the all around mechanic will continue to hold his own.

Shortage of Apprentices in the United States

Magnus W. Alexander, president of the National Industrial Conference Board, explained the situation excellently in a paper before the American Society of Mechanical Engineers in December, 1924. That is some years past, but conditions have not changed materially since then. According to investigations made by his organization, about 5 per cent of the industrial workers in the United States must be replaced every year. Since the ordinary apprentice training course extends over a period of several years, 15 to 20 per cent of the total number of skilled mechanics should be constantly in training as apprentices in order to supply the required 5 per cent every year. He placed the number of skilled mechanics in the United States at 4,500,000. Fifteen to 20 per cent of this number would be from 675,000 to 900,000 apprentices. As a matter of fact, only 144,000 apprentices were reported in the United States at the time his paper was presented. Accordingly, there was at that time a shortage of over half a million apprentices in the country, indicating a pronounced shirking of the duty of training mechanics on the part of American business people in general.

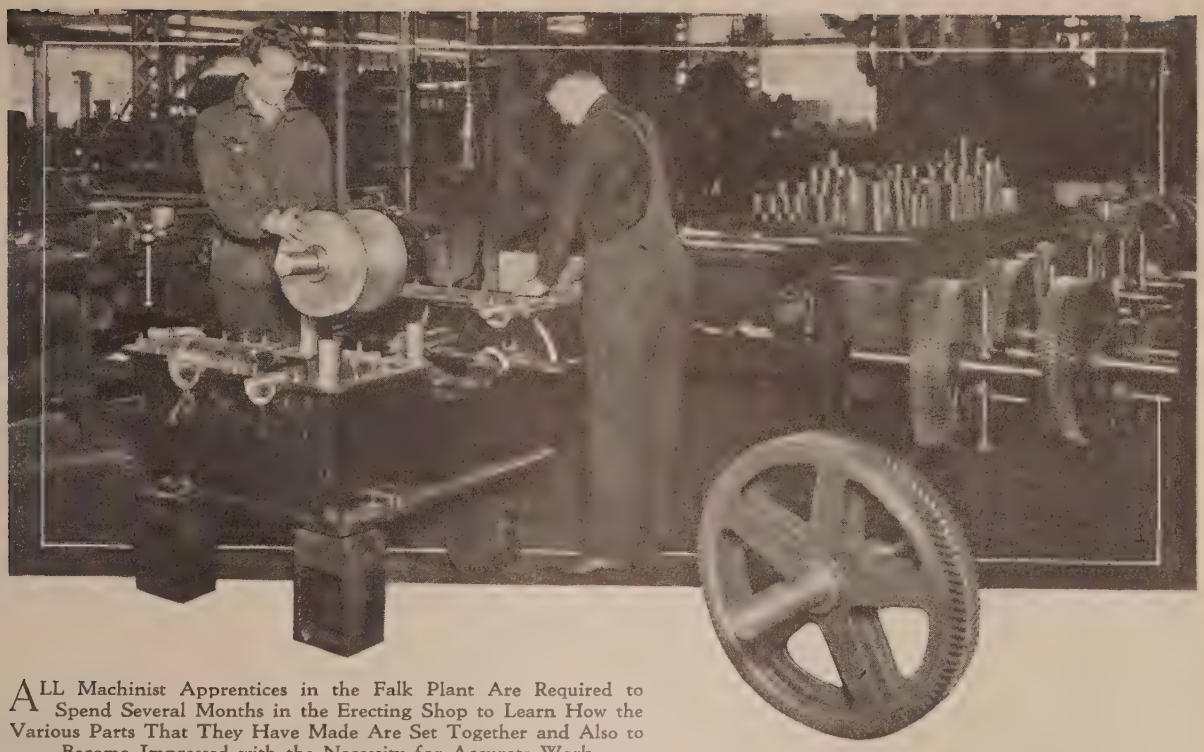
Apprentice Training Not a Financial Burden

Apprentice training will not be an added financial burden upon the manufacturer, if carefully established and if the quota of apprentices is correct. It has been shown by experience that the work of apprentices is done well enough to carry not only the labor cost but all indirect charges caused by apprenticeship administration and supervision as well. However, apprenticeship is no longer a paying enterprise if the quota of apprentices is too high.

For this reason the present conditions are unfair to those few manufacturers who train apprentices. They find that a very considerable portion of the apprentice graduates leave as soon as their course is completed. This proportion is sometimes as high as 50 per cent. Accordingly these companies are forced to maintain up to double the correct quota of apprentices in order to supply their own requirements in skilled men.

Industry Needs Universal Apprenticeship

There are reasons other than the unfairness of the present methods why apprenticeship should be extended to every industrial district and to practically every manufacturer. Industry's need for trained men will not be satisfied until this is done. Although certain manufacturers now train many more apprentices than they themselves need, it is utterly impossible for them to train all that are required, even if they were willing to do so. The shortage of half a million apprentices in the country which was pointed out by Mr. Alexander cannot be made up until apprenticeship becomes universal. Apprenticeship should be made a community responsibility in every manufacturing district. Employers in each district should



ALL Machinist Apprentices in the Falk Plant Are Required to Spend Several Months in the Erecting Shop to Learn How the Various Parts That They Have Made Are Set Together and Also to Become Impressed with the Necessity for Accurate Work

associate themselves for the purpose of supplying together the number of skilled mechanics required in the district.

How universal apprenticeship is to be achieved is another matter. Apprenticeship will not grow of itself. It is comparatively easy to point out the need for it and extremely difficult to devise a way of bringing it about. However, intensification of efforts already begun will go a long way.

Promotion by Interested Employers

Employers who are training apprentices can accomplish much. Economists, engineers, employment experts, Federal and State agencies, educational authorities—all these can preach the need of apprenticeship to a manufacturer and he will pay little attention to them. But when another manufacturer, one of his own class, one who is confronted by the same problems and difficulties, tells him that apprenticeship is necessary and that he has made a success of it, the skeptical manufacturer becomes interested.

Therefore, manufacturers who employ apprentices will do well to call the attention of their associates constantly to the advantages of apprentice training: The strong corps of young mechanics who will be effective for years to come; a stable organization, sympathetic with the policies of the employer; a group of young men from whom

FALK Corporation Apprentices Have an Association That Sponsors Entertainments and Athletic Events. The meeting depicted shows part of the association organizing for an annual picnic

executives and officials may be selected, and the desirability of a force of mechanics who are not only skilled in their trades but thoroughly acquainted with products in addition.

In the Milwaukee branch of the National Metal Trades Association much has been accomplished in this direction by a number of well-organized committees on apprenticeship. By standardized supervision and procedure and a program of promotion they have doubled the number of apprentices in the district in the last 10 years. Trade skill contests, banquets for apprentices and for foremen and superintendents, and contact with the schools have played an important part in this work.

Wide Publicity Essential

In addition, the development of apprentice training can be greatly assisted by general and constant publicity. This should be directed not only toward business men, but also toward the general public, associations of various kinds, civic bodies and, especially, school teachers and school authorities. It has frequently been pointed out that no program of apprentice training will be successful that is not built upon the approval of the community.

In this matter of publicity, the trade and business magazines and papers have performed an excellent service and no doubt will continue to do so.

Helpful Activity of Trade and Manufacturing Associations

Much can be expected from the manufacturing and trade associations, which have also contributed a great deal to the development of apprenticeship. The officers and professional managers of these associations have, as a rule, shown more foresight and appreciation of the advantages of apprenticeship than have the members themselves. This was to be expected. The individual member of an association is more or less absorbed by the activities of his own plant and business. He is seldom in a position to appreciate difficulties of a general nature unless they concern him directly.

On the other hand, officers and managers of associations can survey the entire industry that they serve, and their investigations frequently disclose the existence of problems that must be solved by the industry as a whole, even though they may not oppress any individual member to any appreciable extent. For instance, every employer who is a member of an association may hire salesmen and foremen as he needs them and think nothing of it. However, the manager of the association understands that members are merely taking these salesmen and foremen from each other, creating a high turnover and increasing the cost of doing business for all.

A number of associations have appointed training directors and have made considerable appropriations for their work. The directors visit the members, help them in organizing apprentice training programs and make efforts to interest those who have not begun the work. Associations have also made discussion of apprenticeship problems a part of their regular meetings, have issued booklets and circular letters on the subject and have given to the movement the support of their boards of directors.

In addition, certain associations have made a careful study of the problems of apprenticeship and have prepared solutions for their membership when possible. Thus, they have arranged and published courses of work for various trades, standard forms for contracts, certificates and records, have established bureaus of information, have made calculations of the needs of their membership for mechanics and have worked out theoretical minimum quotas of apprentices. Unfortunately, such work has seldom been fully appreciated and sometimes has not even had the full approval of all members.

Worthy Activity for a Wealthy Foundation

The suggestion has been made that apprenticeship would be an excellent field of activity for one of the wealthy foundations. The mere fact that such an institution took up the study of apprenticeship would give a great impetus to the movement.

The development of apprentice training so far has been due almost exclusively to the efforts of the various agencies that have been described and, undoubtedly, they will achieve still greater results. If more people can be attracted to these activities and can be made to take an interest in them, a much greater extension of the movement during the next few years may be expected. Other and better plans may easily come to the minds of those who apply themselves to the study of universal apprenticeship, a problem that must be solved.

Germans Study Energy Losses in Heroult Furnaces

TWO articles have appeared in the German technical paper, *Archiv für das Eisenhüttenwesen*, discussing energy losses in Heroult electric furnaces.

The first article discussed losses in a 7-ton furnace with particular reference to heat accumulation processes. N. Wark was the author. With the intention of determining the distribution of the energy losses between the transformer, the current leads, the cooling water, the furnace body and the furnace gases, it was found that time of charging, the quality of the scrap and the condition of the furnace refractory walls in particular, have an influence on the heat losses of the furnace. The flow of heat through the furnace walls was investigated; and it was ascertained that the amount of the accumulated heat decreased during the melting period, as the heat supplied to the walls was insufficient to make up for that which was radiated externally

In the other article, written by H. Klinar, O. Reinhold and N. Wark, losses in a 15-ton furnace with particular reference to the wear of the roof were discussed. Energy balance sheets were prepared for the life of one roof from the data obtained during four melts, using cold charges. These showed clearly the dependence of the heat losses on the wear of the roof.

As regards the ability of the roof material to absorb heat, the results which were obtained confirmed those recorded with the 7-ton furnace, referred to above. The thermal balance sheets of melts made with liquid charges showed that the energy supplied was almost entirely used up in the formation of the slag and in making up the radiation losses.

These abstracts were made by the Iron and Steel Institute and the National Federation of Iron and Steel Manufacturers of London, England.

"The Thermal Expansion of Tantalum" is the title of research paper No. 62 of the United States Bureau of Standards. It is a reprint from the bureau's *Journal of Research* and the author is Peter Hidnert. It contains 10 pages and is illustrated with charts.

Foundry Uses Hot-Blast Cupolas

Marked Savings in Fuel and Time—Borings Made into Briquettes for Charge—Mixing Ladle to Be Used

BY FRED L. PRENTISS*

BY adopting improved production, materials-handling and other methods, and by providing better arranged foundries and more efficient equipment, the automotive industry has played an important part in the last few years in the development of the foundry industry. These changes have resulted in the reduction of hand labor to a minimum, better working conditions for the men, lower production costs and improvement in the quality of the product.

When a new foundry is built to make motor car castings, the builder attempts to improve on the last one and thus to assure a further increase in efficiency and reduction in the cost of making castings. The latest foundry to be built for the manufacture of motor car castings is the gray iron unit of the Oakland Motor Car Co., Pontiac, Mich. Its numerous interesting features in layout, arrangement, handling and other equipment, foundry practice, elimination of hand and hard labor make it an outstanding plant in the foundry field. Well lighted and well ventilated buildings make working conditions excellent.

Preheated Blast Used for Two Cupolas

From a production standpoint one of the most interesting features is the use of hot-blast cupolas, the blast of two of the four cupolas being preheated by the combustion gases from the cupola, resulting in a greater output and a saving in fuel. This is the first automobile foundry to use the hot-blast method with its cupolas, although the Griffin Wheel Co. has been using hot-blast cupolas for some time.

A new method of handling the cupola charging material and making up the charges is designed as an improvement over methods employed in other modern production foundries which have largely eliminated hand labor in the charging of cupolas. One of the interesting features of this part of the foundry is that cast iron borings are made into briquettes for the cupolas. The equipment for handling the borings and the briquettes themselves is all a part of the cupola materials-handling system, working in conjunction with the equipment for handling pig iron and scrap.

Methods provided for delivering castings and sand from the shake-out to the basement, removing them immediately from the foundry floor and keeping the foundry largely free from the heat, smoke and gases that come from the molds and castings, are recent developments which tend to improve working conditions in the foundry.

Built for making practically all castings for the Oakland and Pontiac cars, the foundry has a rated melting capacity of 450 tons a day. The buildings are arranged for convenience in handling material and castings, the whole plant being laid out to avoid counterflow of work.

*Resident editor, THE IRON AGE, Cleveland.

Cupola Charging Floor. Charges are brought up by the cupola charger from the ground floor through the shafts shown

Four tracks coming in from one side feed the plant. Two of these are for sand and two for fuel and metal. A fifth track serves a conveniently located service building, running along a dock at the side of that building for delivering flasks, wire, machinery and miscellaneous supplies to the maintenance department, stock room and wire room.

Finished castings, on leaving the cleaning department, move to the adjoining shipping department and from the loading dock at the side of that department are carried by truck to the adjoining motor building. Service yards of ample size are provided between the foundry buildings.

All four cupolas have 90-in. shells, lined down to about 60 in. Gases of combustion are drawn from the hot-blast cupola into a gas chamber through 16 openings 5 ft. below the charging door, by a suction fan using ½-oz. suction. The gas, mainly carbon monoxide, is delivered to the combustion chamber of one blast heater that serves the two cupolas. Cold air for the cupola blast is delivered by the cupola blowers into the blast heater and, after preheating by the burning of the cupola gases, enters the cupola at a pressure of 8 oz. at a temperature of 400 deg. Fahr. That temperature is closely maintained at all times. The volume of preheated air entering each cupola is controlled by a Bacharach indicator and recorder.

Blast for the four cupolas is supplied through one feed line by three Root blowers, two driven by a constant-speed and one by a variable-speed motor. As low pressure is used on the hot-blast cupolas, the full capacity of the three blowers is not required. For this reason the volume of air is regulated by the use of one variable-speed motor.

A Measure of the Improvement in Performance

Melting capacity of the cupolas has been materially increased by the use of the hot blast. The output of each hot-blast cupola is 19 to 20 tons an hour, compared with 15 to 16 tons an hour on the cold-blast cupolas with the same linings. Coke consumption has been reduced to one ton for 10 tons of iron melted, compared with a ratio of 1 to 7 in the cold-blast cupola. The sulphur content of iron melted in the hot-blast cupola is considerably lower than that made in the cold-blast cupola. Another advantage claimed for the hot-blast method is that it preserves the furnace linings.

For making iron for all kinds of castings the cupola charge is 4000 lb., of which approximately 46 per cent is malleable pig iron, 5 per cent nickel-chrome iron, 35 per cent cast scrap and the remainder steel scrap. Cylinder blocks and heads are made of hard iron. Iron for flywheels and clutch plates at present is softened by the addition of ferrosilicon in the ladle. With the completion of all the molding units, both hard and soft iron will be made, the latter to be used for the smaller parts. These will include transmission housings, intake and exhaust manifolds, clutch plate housings and miscellaneous small castings.

HANDLING Equipment in Weighing Room, the Stockyard Being at the Left, Outside the Building. Weighed material drops into the charging buckets as they are pushed along the rollers at rear. The briquette hopper is shown at top

LIFT Truck Picks Up Charging Bucket by Cone Head on a Shaft Extending Through Center of Bucket, and Carries It by a Slot in the Truck Frame

Metal from the four cupola spouts will flow into a 4-ton mixing ladle, to be installed shortly, to secure a more uniform metal. This ladle, of the tilting type mounted on an electric truck, will deliver the iron to the Sprague hot-metal carrier now in use. This has a 2000-lb. ladle in which metal is taken to the pouring bays, where it is delivered to the pouring ladles.

Four short, horizontal conveyors carry metal from the stockyard through openings in the side wall to the weighing room, at the side of the cupola building, in which the charges are made up. One conveyor handles

CHARGING Bucket Setting on a Scale to Receive Its Charge of Coke and Limestone from the Hopper Above (Right)

steel scrap, one cast scrap and two pig iron. Pig iron and scrap are placed on the conveyors by the traveling stockyard crane, equipped with a lifting magnet, and from each conveyor the metal drops into a weighing hopper of about 1-ton capacity.

There is a weighing hopper for each conveyor and a fifth for briquettes. The metal is dropped from the weighing hopper to a charging bucket of 4000-lb. capacity set on a roller conveyor located at floor level. This conveyor extends along the side wall of the weighing room, directly beneath the hoppers. The empty charging bucket is spotted by a specially designed electric lift truck under the first hopper and, after the charge is received from this hopper, the bucket is pushed forward on the roller conveyor by an air-operated mechanism that moves the bucket a fixed distance—to a point beneath the second hopper—to receive the second portion of its charge, and so on until the charge is made up. Charges are placed in the bucket in this order: Steel scrap, waste scrap, briquettes, two kinds of pig iron.

The charging truck picks up the loaded bucket at the end of the roller conveyor and sets it beneath a hoisting shaft that connects with the cupola charging floor above.

Borings are brought in open-top cars from the motor plant to the stockyard and unloaded with the stockyard crane, which places the scrap into two storage bins, each of 50-ton capacity. A single belt conveyor carries the scrap from these bins to a Southwark briquetting machine in which they are made into cylindrical briquettes 4 in. in diameter and 4 in. long, weighing about 8 lb. each. The briquettes are discharged into an elevator which carries them to a horizontal conveyor above the weighing room. From this they fall into two 50-ton storage bins located above the roller track on which the charges are made up. From these bins the briquettes are discharged into a weigh hopper located in a line with the other hoppers used in making up the charges.

Coke and limestone are dumped from hopper-bottom cars into the hopper of an automatic skip hoist, which delivers the fuel and limestone into a storage bin at the end of the weighing room. This bin, having a capacity for four carloads of coke and one of limestone, is divided into five sections, the center section being for limestone and the others for coke. Coke and limestone are discharged from the bin through a hopper into a charging bucket—800 to 1000 lb. capacity—set on a scale. The discharge gate of each bin section can be operated independently. The bucket with its charge of coke and limestone, 60 lb. of the latter per ton of metal, is taken by the charging truck to the hoisting shaft. Coke breeze and fine coke pass through a screen that leads to a storage tank.

An interesting feature of the coke-charging equipment is the design of the charging buckets. These have a steel shaft through the center, on the upper end of which, extending slightly above the top of the bucket, is a cone-type button which is used for handling the bucket. The charging truck designed to operate the bucket picks up the bucket by the button. The cupola charging machine which elevates the bucket to the charging floor also lifts the bucket by gripping the button end of the shaft. The buckets are 48 in. high and 54 in. in diameter, and have dump bottoms.

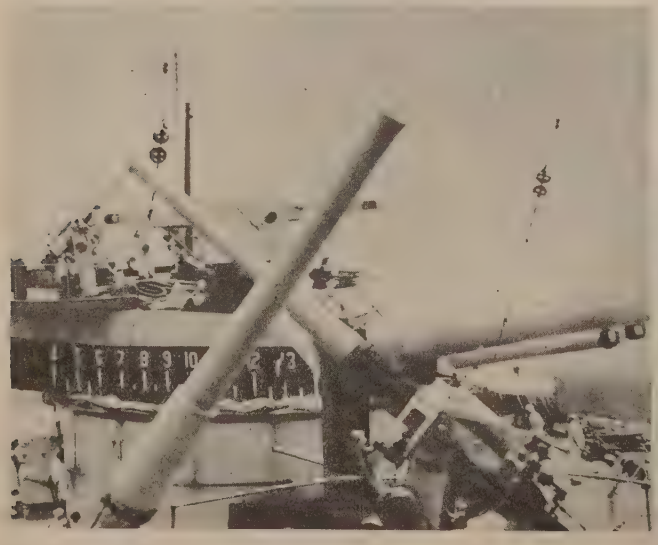
As the elevating shaft is oval in form, providing room for two buckets, a loaded bucket can pass up and an empty bucket down at the same time. The cupola charging machine sets the bucket into the cupola, flanges on the bucket sides resting on a wishbone in the cupola. Then the bucket is dumped from the bottom.

This charging machine differs from those used in some foundries in that it is not provided with an operating cab. Instead, it is operated by a control switch at the side of the cupola, and only one man is required to charge two cupolas. He controls the movements of the bucket and charging by simply stepping from one switch to the other.

[*A second article will follow, describing the molding, pouring and cleaning facilities.*]

Gears and Wireless Antennae of Phosphor Bronze

TWO bureaus of the United States Navy make large use of gears: the Bureau of Ordnance, in charge of guns and torpedo tubes, and the Bureau of Engineering, of the power supply and all auxiliaries, such as deck and hoisting engines. Both bureaus are wide users of phosphor bronze gears, the former in gun mountings, the latter in auxiliary engines and equipment. And both specify gears which show best possibilities in civilian practice; they desire that such products be standardized. In the two pictures, which were furnished by the Phosphor Bronze Smelting Co., Philadelphia, gears of that metal, hidden in the winch and the gun mountings, do not appear. But the wireless antennae shown are of the same metal.



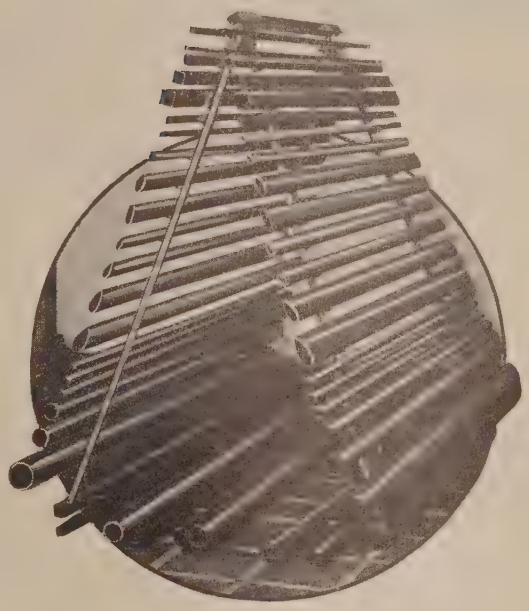
Metals Used in Airplane Making

Increasing Volumes of Chrome-Molybdenum, Nickel and High-Carbon Steels and Aluminum Alloys

BY GEORGE S. HERRICK

SINCE the memorable flight in a heavier-than-air machine by Orville Wright at Kitty Hawk, N. C., Dec. 17, 1903, not only the materials but the designs of aircraft construction have been changed radically. The box-like craft of bamboo, ash or balsa wood and cloth, with ordinary steel wires for the flying and landing braces of the wings, has rapidly developed into the modern craft of rakish lines and metal construction. Each step in the progress has found metal coming into increasing importance, until the airplane has become the incentive to the rather intensive development of both steel and non-ferrous alloys, all competing for a permanent and efficient place in aircraft manufacture.

Almost over night the American end of the airplane industry became a real factor among our manufacturing enterprises, and while Europe, as in the development of the motor car, continues, of course, to be a builder of airplanes, America is in the throes of an activity which is approaching the mass production basis that is characteristic of modern industries in this country.



THESE Tubes, Round, Square and Streamline in Various Sizes, Are All Used in the Construction of Aircraft. The display is of tubes made by the Summerill Tubing Co., Bridgeport, Pa.

It is estimated that about 60 companies are constructing almost 95 per cent of all the airplanes produced in this country at the present time. Of these, about eight are leaders in building the large, all-metal, passenger carrying types.

Of the total output, probably about 90 per cent of the planes are fabric covered over alloy steel frames, with a few of alloy aluminum frames, leaving about 10 per cent covered with aluminum alloy sheets. Magnesium still is preferred by some makers for certain parts. Aluminum foil still finds use to cover the wood frame, or metal parts, to protect them against rotting or corrosion from contact with the textile covering, which has been treated with an acetate "dope."

Chrome-Molybdenum Steel Most Used

Except for certain builders who are using fuselage frames of 17-ST aluminum alloy in the form of structural shapes or tubing, chrome-molybdenum steel tubing is preferred. Those who have European experience cling to a medium-carbon seamless steel tube. It was the ordinary seamless tube which succeeded the fuselage of wood and is still used by many British and Continental builders. This tubing, listed in Army and Navy specifications as No. 57-180-1A, has an analysis of C, 0.20 to 0.30 per cent, Mn, 0.50 to 0.80 per cent, P, 0.045 per cent maximum and S, 0.050 per cent maximum. Its physical properties are a minimum strength of 55,000 lb. per sq. in. and yield point of 36,000 lb.

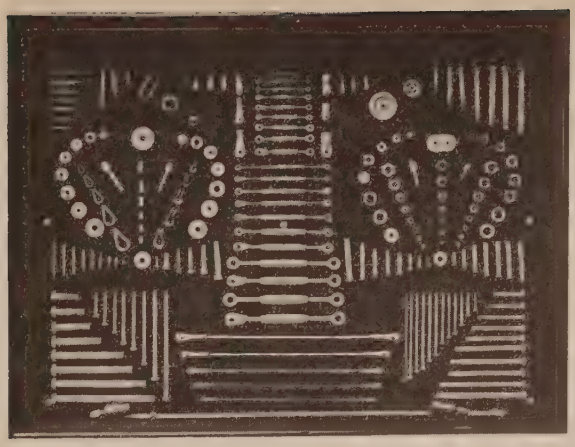
By far the greater number of American builders today are using chrome-molybdenum steel tubing classified in the Army and Navy specifications as No. 57-180-2A and with a standard analysis of C, 0.25 to 0.35; Mn, 0.40 to 0.60; P, 0.04 max., S, 0.045 max., Cr, 0.80 to 1.10 and Mo, 0.15 to 0.25. This is the same analysis as S. A. E. No. 4130 X. Most of it is of the seamless manufacture, streamlined (ovate section) in exterior positions, where air resistance must be at a minimum.

The round chrome-molybdenum tubing used ranges in size from ¼-in. outside diameter and 0.028 in. in wall thickness and 7/16-in. O. D. with 1/32-in. wall to 2½-in. with ¼-in. wall. In certain of the large passenger carrying ships, tubing as large as 3½-in. O. D. with ½-in. wall is used, usually only for a small section for an axle or for part of the frame of the landing gear.

The smallest diameters of tubing are used in high-speed planes for forming the frame of the tail and after section of the fuselage, the larger diameters going into the main section and the undercarriage. Certain makers use a limited amount of square tubing for the frame around the cockpit, as they claim that the square tube offers greater resistance to squeezing, tending to afford great protection to the occupant of the cockpit in the event of a serious accident.

Streamline tubing goes into such parts as the undercarriage and struts of the wings, where motion through the air will be attended with a minimum of eddies. These streamlined tubes are drawn in all the required sizes and vary somewhat in shape, as may be seen in the accompanying illustration of a sample stand at the Summerill Tubing Co., Bridgeport, Pa.

The quantity of tubing used in an individual plane ranges from 350 ft. in a small open cockpit, single place plane to possibly 1000 ft. in an open cockpit two place plane, about 1400 ft. in an inclosed cockpit design, 1600 ft. or more in a large passenger carrying plane, such as the "Patrician" recently built by the Keystone Aircraft



THESE Products for Aircraft, Consisting of Bolts, Tie Rod Terminals, Turnbuckles, Shackles, Washers, Grommets, Thimbles, Pulleys, Ferrules, Clevis Pins, Nuts. Are Produced by the Aero Supply Mfg. Co., College Point, L. I., or Its Subsidiary Companies, the Standard Automatic Products Corporation, Corry, Pa., and the National Steel Products Co., Dayton, Ohio

Corporation, Bristol, Pa., and as much as 3000 ft. in a large, 30-passenger ship, recently constructed by the Fokker Aircraft Corporation of America, Hasbrouck Heights, N. J.

Makers of tubing for aircraft, as do manufacturers of other materials entering into airplane construction, apply rigid standards of inspection. In the plant of the Aero Supply Mfg. Co., College Point, N. Y., is prominently displayed the advice to workmen, "Make It Safe for the Flyers," and in the inspection department of the Summerill Tubing Co., Bridgeport, Pa., is a large sign with the advice to inspectors, "Above All Be Careful. You'll Fly Yourself Some Day."

In this latter mill, tubes travel through in lots, usually consisting of a single order. When the swaged end, used for drawing the tubes through the dies, is sawed off, each tube is permanently numbered on the end and after passing through the straightening machine goes to an inspector, who tests for hardness. He marks the result on a sheet, which is kept as a record together with the order of the customer; and in the event of a complaint the hardness indication as well as the analysis of the steel used are available for each tube.

When material is intended for the Army or Navy, the tubes are turned over for final inspection to a Government inspector, who marks each tube passed by him with his own die, which, in the case of the Navy is an anchor, the initials U.S.N. and the inspector's own initials or sign.

Covering the Fuselage

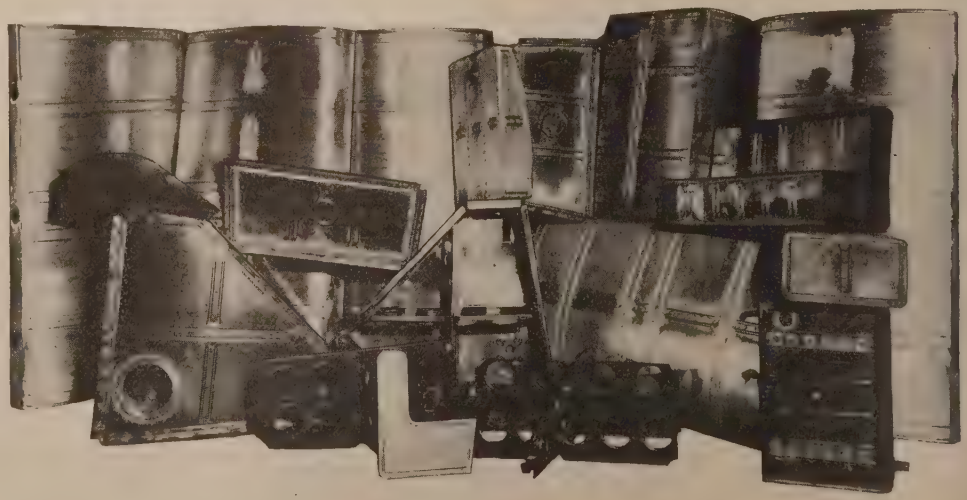
Aluminum and its alloys are being increasingly used in aircraft construction. While sizes and gages of sheets are far from being standard they are usually of Nos. 12 to 30 gage, but mostly of Nos. 16 to 18 gage, corrugated. The corrugating varies with the builder. In general, sheets are used in wing construction, gas tanks, ship cabins, bottom lining, cowling, instrument boards, fuselage covering and incidental fittings such as battery boxes. On seaplanes, hull frames and sheathing, decking and pontoons are often made of strong alloy sheets. It is difficult to estimate the average amount of aluminum entering into an airplane, but it is noteworthy that in 1928 the aluminum used in aircraft increased about 250 per cent over the quantity consumed in the preceding year. As airplane production increased only about 150 per cent during that period, it appears that the use of aluminum has grown faster than the industry.

In the all-metal airplane, aluminum alloy sheets, usually duralumin, 17-ST, or Alclad sheets, are used almost exclusively. A Kansas City, Mo., builder recently experimented with welding thin-gage black steel sheets, for covering the fuselage, but the results are understood to have been less satisfactory than expected.

Pure aluminum sheets are used almost entirely for fuel tanks, which sometimes occupy most of the available space in the fuselage and in some cases are in the wings. The welded tank is preferred. Occasionally a riveted duralumin or Alclad tank will be specified and in a few instances tanks have been made of dairy tin plate. Some years ago copper tanks were rather widely used.

Aluminum, or alloy of aluminum, sheets for tanks are usually of Nos. 14, 16, 18 and 20 gages, depending upon the capacity of the tanks, which range from a few gallons in those designed for the wings or tail to as much as 550 gal. in a single tank on the larger air transports.

As with many other products entering into aircraft, tanks are far from standardized, each builder specifying the size and shape suitable to the plane being constructed. In certain of the larger craft, intended for long-distance flights, practically the entire interior, except the cockpit, will sometimes be composed of closely fitted tanks. So much space do they occupy that they are not only formed to the shape of the fuselage, but when necessary, as to pass controls and other wiring through, a



A FEW of the Shapes of Welded Aluminum Tanks for Aircraft Fabricated by the Paramount Welded Aluminum Products Corporation, Brooklyn, N. Y. In the foreground are sections of honeycombing for the interior

LARGE Capacity Aluminum Tanks with the Baffle Plates Riveted in Place and the Rivets Welded. This interior construction permits free flow of fuel to the motors, but prevents sudden shifting of the contents

section of pure aluminum tubing is welded into the tank from side to side, or across a corner. When the space through the tank for controls is large the tank is practically built around a hole.

For oil tanks, a number of builders specify tubes welded across the tank, usually at the ends, to permit circulation of air as an aid in maintaining a cool oil supply. Such tubing is almost entirely of pure aluminum, although the fittings on tanks are sometimes of aluminum alloy, which holds a thread more satisfactorily than the pure metal.

The accompanying illustrations show tanks of various designs for aircraft fabricated by the Paramount Welded Aluminum Products Co., 195 Morgan Avenue, Brooklyn, N. Y. The cross section baffles in all the larger tanks and most of the small designs are stamped from aluminum sheets and riveted into the tank interior to prevent sudden shifting of gasoline to one side, which might cause a heavily loaded plane to overturn. The baffle sections are constructed to permit free flow of fuel to the motor in any position.

Black Sheet Stampings

The industry uses a small tonnage of black steel sheets in the manufacture of miscellaneous fastenings and accessories. When stamped, or otherwise fabricated for use in exposed places, the usual requirement is Army and Navy specification No. 57-136-8, the analysis of which is C, 0.25 to 0.35 per cent; Mn, 0.40 to 0.60; P, 0.04 max.; S, 0.045 max., Cr, 0.80 to 1.10 and Mo, 0.15 to 0.25. Stampings in places where strength and resistance to corrosion are not so important are usually of Army and Navy specification No. 57-136-3 and have an analysis of C, 0.20 to 0.30, Mn, 0.50 to 0.80, P, 0.045 max. and S. 0.045 max. The finished stamping of either quality of sheets is always coated, usually with cadmium, to prevent corrosion.

Steel Cord and Tie Rods for Bracing

Wire and cord, or the number of tie rods used in a plane vary with size and design. A biplane with two wings to be braced with the landing and flying braces requires considerably more wire cord or tie rods externally than a monoplane. Until a few years ago, builders in most cases used wooden longerons, or main longitudinal members for the fuselage, and these were braced with wire, which could be adjusted to the proper tension by turnbuckles. This type of construction is still used, but chrome-molybdenum, high-carbon or aluminum alloy tubing, or rolled alloy aluminum shapes take the place of the wooden longerons. Tinned No. 10 or No. 20 gage steel wire, or tie rods of the exact length of the section to be braced are used.

Two active makers of tie rods are the Stewart Hartshorn Co., New York, and the MacWhyte Co., Kenosha, Wis. The rods range from 0.138 in., 6-40 thread to 0.625 in. in diameter, ⅝-18 thread and have a total ultimate strength of 1000 to 24,700 lb. in the streamline section, depending upon the size and from 1080 to 35,800 lb. in the thread section. They are made to A.S.M.E. specifications in the smaller sizes and to S.A.E. specifications in the larger sizes. The Army and Navy specification for tie rods compares with the S.A.E. and requires C, 0.40 to 0.50 per cent, Mn, 0.50 to 0.80, P, 0.045 max. and S, 0.050 max.

When used externally for flying or landing braces these tie rods are streamlined. For tying in the frame of the fuselage a square rod is usually specified. All such rods are plated, usually with cadmium. Sizes used depend upon the capacity of the plane, an ordinary light commercial plane requiring about 5/16-in. and smaller rods, the larger sizes entering into the heavy transports and bombing planes for the Army and Navy. All such rods are subject to careful inspection as with other products for aircraft, and in the case of the Stewart Hartshorn Co., all rods are subjected to a proof test load equivalent to 60 per cent of the specified breaking load.

While many manufacturers use tie rods throughout their planes, others specify steel aircraft cord. Of this, three principal types are used, the so-called hard, 19-wire strand, composed of 19 galvanized, or tinned wires stranded together, the so-called flexible 7 x 7 cord, composed of strands of seven galvanized or tinned wires, six strands around one, and the extra flexible, 7 x 19 cord, composed of strands of 19 tinned wires, in six strands around one. The illustration of cross sections is of cord manufactured by the John A. Roebling's Sons Co., Trenton, N. J.

For the wing bracing on biplanes, the usual practice, when cord is used is to specify 19 strand, galvanized or tinned, which is classified by the Army specifications as No. 48-21. In some instances, makers use 6 x 7, cotton center galvanized or tinned cord, Army specification No. 48-14A and occasionally 7 x 7, wire center, galvanized or tinned cord, Army specification No. 48-22. No special flexibility is required in the wire for this exterior bracing of the wings.

A substantial footage is required as the flying wires are generally double while the landing braces are either single strands of cord, or two small-diameter pieces are used, so that they may be streamlined by binding together with balsa wood between. When steel cord is used, turnbuckles are required. These range from 4½-in. to 9½-in.

Fig. 1. 19-wire Aircraft Strand

Fig. 2. 7 x 7 (Wire Center) Aircraft Cord

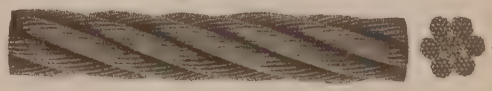


Fig. 3. 7 x 19 Aircraft Cord

from pin-eye to pin-eye, with strength of 800 lb. in the small sizes to 17,500 lb. on the larger sizes. The ends of the turnbuckles are of steel to S.A.E. specification No. 2330, while the barrels are of special bronze, Army and Navy specification No. 57-162.

A considerable length of the heavier cord is used in the interior for controls on the rudder, elevators and ailerons. The usual steel cord for this purpose is the 7 x 19, tinned, which is extra flexible. The sizes used vary from ⅛ to ¼ in. in diameter. While it is difficult to estimate the amount of wire used in an airplane, the total footage of the various solid wires and cords will range from 250 to 300 ft. in a small design using steel cord for exterior bracing and 500 to 700 ft. and more in a large passenger carrying plane. Some builders of monoplanes in the exterior bracing of the wings use a section of chrome-molybdenum tubing from the fuselage to the underside of the wings and this is streamlined by covering with aluminum sheet. By making these braces wide, one builder claims increased lifting power for the plane.

While galvanized wire is still used, the tendency is decidedly toward increased use of tinned wire, and wire with cadmium plating. As in the case of other materials, the wire and cord used are subject to numerous tests and are all manufactured to either Army or Navy specifications. In the case of wire and cord the two Government branches still retain specifications which vary slightly in some instances.

In addition to the wire and cord required for interior bracing of the fuselage, and wings, exterior bracing of wings, nose and tail and the controls, there is a moderate amount of insulated wire used in the wiring for lights, ignition, grounding and antennae, and welding rods are used for chrome-molybdenum steel tubing or rolled shapes.

Resistance to Corrosion a Factor

Second only to strength in aircraft construction is the factor of corrosion. When aluminum is used, further protection is not necessary, but aluminum alloy of the 17-ST type is subject to corrosive action, which has been overcome to a certain extent in the Alclad sheet. In the case of alloy steel, which is exposed, a protective coating must be applied to meet the Army and Navy test of 100 hr. in an atmosphere of salt spray. Galvanizing is sometimes used, but is being succeeded in many plants by cadmium plating, tin coating and other processes. Recently chromium plating for exposed parts made of aluminum alloy is being considered by manufacturers.

All bolts, nuts, rivets and wing reinforcement materials are either of heat-treated aluminum alloy or of alloy steel. While nuts are of ordinary steel, all bolts are made from nickel steel, according to S.A.E. specification No. 2330, or Army and Navy specification No. 1004-C, with an analysis of C, 0.25 to 0.35 per cent, Mn, 0.50 to 0.80 P, 0.040 max., S, 0.050 max. and Ni, 3.25 to 3.75. All bolts are heat treated to give a minimum strength of 125,000 lb. per sq. in.

Products Bear Makers' Marks

Whenever the product permits, there is a growing use among manufacturers of individual marking of materials. While not general, a number have adopted a system of marking bolts and similar small finished products with an X, the official designation of Army and Navy specifications and certain manufacturers add their own sign or letter. The Aero Supply Mfg. Co., College Point, N. Y., a manufacturer of bolts and other small products, whose entire production goes to aircraft builders, marks each bolt on the head with the Army and Navy X and a letter, changed each year, so that at any time the bolt may be identified as made by this producer in a certain year.

As the Army and Navy specifications have been revised considerably and are still subject to minor revisions from year to year, this identification enables the maker to determine at any time whether or not the bolt in question was made to the standard effective in the year designated by the mark.

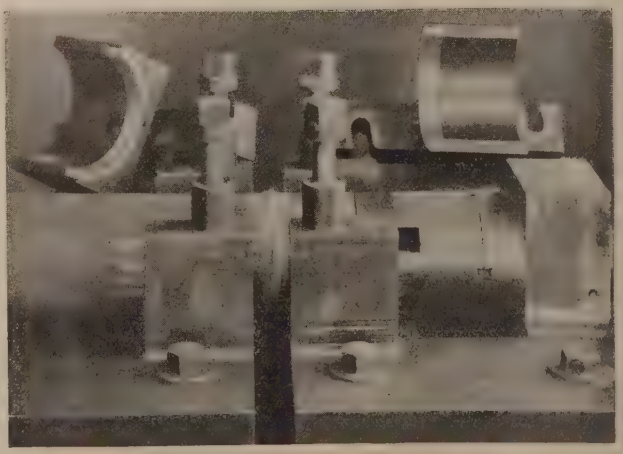
From this it becomes evident that, despite the requirements of lightness, strength and resistance to corrosion for material entering into aircraft production, this new and growing industry offers a source of increasing consumption of alloy steels. Non-ferrous metals, especially aluminum and its alloys, are being used extensively and will undoubtedly continue to be, and as the aircraft industry tends to reach a basis of quantity production, comparable to other great industries of the country, the factor of cost of materials as well as quality will be increasingly important, which should bring alloys of steel into still greater use by the builders of aircraft.

Flash Welds on Aircraft Tubing

JOINTS in the tubing forming the skeleton of aircraft are commonly welded with the oxy-acetylene flame as being well fitted for the thin gages of metal used, and the intersections are at such varying angles that hand work is the most economical method.

In some instances, however, a plain butt joint must be made between straight tubing, or an end fitting attached. Then a resistance flash weld is a logical solution. Cases in point are on the struts supporting the landing gear and on the motor fitting of the Ford tri-motored planes. The former is illustrated, lying in the lower jaws of the welding machine.

These welding jaws or dies are lined with Elkonite, a proprietary series of alloys of copper and tungsten. The copper gives the electrical conductivity required to pass the welding currents of large amperage, and the tungsten hardens and raises the melting point to resist wear and overheating. It is said that the dies shown are in perfect shape after 600 welds had been made, whereas the materials formerly used required redressing after 50 operations.



Terminal Strut Immediately After Welding (upper dies removed)

Obsolete and Inactive Patterns

Determining How Long They Should Be Kept— Practices of 80 Leading Companies Reviewed —Storage Charges Sometimes Levied

WHEN to dispose of the little used or obsolete pattern constitutes one of the difficult problems of industry, and affects the small firm as well as the large one. The purpose here is to present methods in current use by different companies in various fields of industry, in the hope that the information may be helpful.

The money expended for storing patterns is evident from the amount of storage space used. One firm has no less than 12 large warehouses filled with patterns; another has nine; others from one to seven or eight. Ingersoll-Rand Co. has, among eight large warehouses devoted solely to pattern storage, one which is 600 ft. long, 50 ft. wide and three stories tall. Sessions Foundry Co. has three good-sized warehouses for storing patterns, one being a large five-story building of modern construction.

B. F. Sturtevant Co., which has manufactured fans, blowers, and allied products for nearly 70 years, has accumulated a tremendous number of patterns. Its line is so varied that it may be called upon to furnish no less than 1,000,000 different repair parts, many of which are castings. At present the company is obliged to carry nearly 100,000 different patterns.

Several factors are to be considered before formulating a definite policy pertaining to the retention of patterns which are seldom used. One is the value of the pattern, measured in terms of its replacement cost, and the other is the obligation of the company to the customer to furnish repair parts or castings which require that particular pattern.

The value of a pattern ordinarily should be balanced against its cost of storage. An obsolete pattern might easily absorb, in storage cost over a given period of time, more than its worth. Often it is more economical to replace occasionally a pattern which has been destroyed than to invest thousands of dollars in storage facilities for patterns that are not being utilized.

No standard practice appears to be in use in the amortization of the pattern account. From replies received from companies all over the country, in different fields of manufacture, the rate varies from 10 per cent to 33⅓ per cent a year.

A wide difference of opinion exists concerning the obligation of a company to its customers in the matter of furnishing repair parts. It is interesting to note that the B. F. Sturtevant Co. recently had returned to it, for repair, a fan that was sold in 1865. The customer did not want a new one. The Krementz Co., Newark, N. J., several years ago received for replacement a 25-cent collar button of its manufacture which had been in continual use for more than 30 years.

"Obsolete" ordinarily means having gone out of use. However, when applied to patterns, the word takes on a different aspect. A pattern which may be classified as obsolete in one industry may not be in another. The type of industry and the nature of the product should be the determining factors in the interpretation of the word "obsolete."

Manufacturers of heaters, boilers and stoves frequently are called upon to furnish new grate bars and analogous parts for units of their manufacture which have been in service for many years. The sides of a stove rarely require replacement. Therefore patterns for old grate bars would not be classified as obsolete, whereas those for the sides of the same stove may be so considered. The nature of the product itself would govern the definition in this instance.

A large stationary steam engine of standard manufacture may have a life of 35 or 40 years in service. Its initial cost runs into a sizable figure. So long as the engine is in operation, parts for the engine which, because of wear or otherwise, may ordinarily require replacement should be available to the owner. The maker of the engine cannot therefore consider the patterns for those parts as obsolete, even though they may remain unused for a long period of time.

In the foundry, a different situation exists. The average jobbing foundry usually has on hand many patterns that belong to its customers, and which it is obliged to store as an accommodation. The foundry has little control over these, other than the knowledge from its own records as to their activity. The foundry is not in a position to judge the obsolescence of the patterns in question, but must be guided entirely by the owners' wishes.

Singer Mfg. Co. provides many metal patterns of each part for mounting on its molding machines. When a class or style of machine is superseded by a new model, all the obsolete metal patterns are destroyed, with the exception of one set, which is kept to fill orders for spare parts over a period of years. In this case, the pattern becomes obsolete when a new model is brought out to supersede the machine using a casting which required that particular pattern.

Organizations Setting Standards

Some effort has been made to set a definite method of procedure as standard in several fields of industry. To this end a number of trade associations have set standard practice recommendations for the guidance of their membership. The Ohio Foundries Association and the Newark Foundrymen's Association have adopted a "Uniform Trades Custom," that patterns not in use for six months shall be subject to storage charges.

The Steel Founders Society has issued a circular covering recommended trade customs, Section II of which reads as follows:

> The foundry shall not be expected to provide storage for patterns for which no orders have been received during a period of two years.

The "Standard Trade Customs" adopted by the Malleable Iron Research Institute incorporates the same ruling under Item 15.

The Machinery Builders Society, upon the recom-

NOTE.—From a report prepared by the Policyholders' Service Bureau, Service on Manufactures, Metropolitan Life Insurance Co., New York. The practices of about 80 machine builders and founders, in 15 States, from Massachusetts to Missouri and from Michigan and Wisconsin to Tennessee and Virginia, were drawn upon.

mendations made by its Committee on Obsolete and Inactive Patterns, recently adopted the following as standards for its membership:

1. All patterns, jigs and fixtures which are special for a job, and not likely to be used again, should be scrapped at the end of the guarantee period.
2. All other patterns, jigs and fixtures that have not been used for a period of five years shall be scrapped.
3. The customer shall be charged with the cost of replacing any of the above that have been destroyed after the stated period, the customer being advised of this fact on receipt of his order for repair parts.

The National Machine Tool Builders' Association states that, with the progress in machine tool design, the average life of the design of standard machines seems to be about seven years. Therefore, if economic life in the users' hands be counted as ten years, the user of the last machine produced on the design would be getting reasonable service if he could get a repair part from the original pattern ten years after the last machine of that design was made. This would give the user of the first machine of this design 17 years, in which he could obtain a repair part from the original pattern. This association therefore advocates that machine tool manufacturers should not under ordinary conditions carry patterns longer than ten years after delivery of the last machine of a type.

Utilizing Inactive and Obsolete Patterns

Many companies have found it not only economical from a cost standpoint, but also an aid in reducing the number of patterns to be stored, to make over the old pattern wherever possible into the new one. This of course necessitates cooperation on the part of the engineering department in so designing the new part that the old pattern can, at least in part, be utilized. It is well so to redesign the part that the new one can also serve as a replacement part for the old model.

Swartwout Co. finds that, as a rule, a pattern becomes obsolete when the company is building a revised model, but quite often it is possible to work the old pattern over to make a new one.

Terry Steam Turbine Co. endeavors in every case to redesign parts for the machines so that they will readily fit into the place of the old one, should replacement be necessary. In this case the obsolete pattern is destroyed immediately.

(In the second and concluding installment will be discussed the time element in connection with retention of patterns and methods of determining obsolesence.)

Action of Coal Dust When Applied to Molding Sand

IN a paper presented at the Third International Foundrymen's Congress in London, June 11 to 14, by Ben Hird on "Coal Dust as Applied to Molding Sand," the author attempts to prove, by practical experiments, the action of coal dust during the pouring of molds which have been faced with sand containing a percentage of this material, and the changed condition of the sand and coal dust after use. There appear to be no data of sustained investigations of the action of coal dust in sand molds.

Practically every foundryman has formed his own ideas as to what actually takes place, the most prevalent idea being that a slight film of gas, or smoke, on the face of the mold, prevents the molten metal from fusing the silica grains giving the casting a clean blue skin, instead of the rough gray appearance when no coal dust is used.

Mold Has Mica Window

A desire to observe what actually happens inside a closed mold during casting led to the adoption of a special mold with a mica window. The pattern, with strip of mica, was rammed up in the usual way in a three-parted box, with the mica in position and opposite the opening in the middle part. Before the pattern was withdrawn the intervening sand between the mica and the slot in the box was cut away, care being taken not to expose the extreme edges of the mica. The in-gate was cut in at the bottom joint. The mold was cast on a low stool to facilitate observation.

When molten iron was poured into the molds made with coal dust facing sand, smoke immediately began to rise up the sides of the mold. The thickness of this smoke varies with the amount of coal dust in the sand, and its volatile content. The top of the rising metal has the form of a meniscus, the convex face uppermost. The metal rises with a rolling action against the sides of the mold, due to the friction of the sand face. There appears to be a clear space, about ⅛ in. to ¼ in. (which follows the shape of the meniscus) between the top of the rising metal and the smoke. This is due to the intense heat of the molten iron.

It required very close observation to see the rising metal trap any of the coal gas. It is certain that this action takes place because the coal specks are giving off their volatile gases and continue for some time after the metal has covered them. Tests on anthracite coal seem to prove that the carbon deposit on the skin of the mold, created by the smoke from the coal dust, has only a preliminary and slight influence on the color and quality of the casting skin.

As the previous mica-window tests were all made on the vertical faces of the molds, further experiments were carried out to find the action of coal dust on the bottom horizontal faces. The advancing metal forms a very pronounced meniscus, which gives a rolling motion to the flow. Between the advancing metal and slight coal smoke there appeared to be a clear space, similar to that in the vertical experiments.

Superfine coal dust is the most efficient for heavy as well as light work. Coarse-graded coal dust, unless used in large proportions, when they cause other blemishes (such as pock-marks and ratching), are too widely distributed among the sand grains to function properly, and leave much of the sand on the mold faces unprotected, or so slightly covered that the coating is burned off by the heat of the metal.

Dust Must Be Superfine Quality and of at Least 30 Per cent Volatile Matter

Therefore, coal dust, as its name implies, must be the dust of coal, and for all classes of work should be of a "superfine" quality. Also, the volatile content should not be less than 30 per cent, in other words, a bituminous coal.

This action of the volatile matter in the coal during the casting of the mold explains the reason why used foundry sand is black, when coal dust is mixed with the facing sand. This can easily be proved by burning the black "used sand" in air. The carbon film will burn off, leaving a brown or gray silica grain, such as is left on the top of an open sand plate when a thin layer of black sand has been thrown after casting.

Southern Rod Mill Electrification

Synchronous Motor Drives and Unusual Motor Combination Used by Gulf States Steel Co. for Rolling Rods from 4-In. Billets

BY GORDON FOX*

A CONSIDERABLE part of the steel tonnage produced by the Gulf States Steel Co. is marketed in the form of wire products. Open-hearth ingots, 18 in. x 20 in., weighing 5400 lb., are reduced in a 36-in. blooming mill, engine driven, to 4 in. x 4 in. billets (nominal size; their section is 14.6 sq. in.). These billets supply the rod mill, which, in turn, delivers to the wire mills. About 80 per cent of the output of the rod mills is No. 5 rod.

The rod mill is of the Garrett type. Six 16-in. tandem roughing passes, of which the last four are continuous, are followed by twelve 12-in. strand and finishing passes arranged in a staggered train as shown in the diagram. This requires rather heavy drafts, especially in the earlier passes, the sectional area of the rod after the ninth pass being less than 0.25 sq. in.

This mill was previously driven by three steam engines. One engine was directly connected to the lay shaft of the continuous roughing stands, another engine drove stands Nos. *7* to *16* inclusive, through a series of rope drives, while a third engine drove finishing stands Nos. *17* and *18*. The steam for these engines was supplied at 150 lb. pressure by coal-fired boilers. The engines exhausted at about atmospheric pressure into a low-pressure line common to this mill and to the steam-driven blooming mill. Much of the low-pressure steam from these mill drives was utilized in low-pressure turbines located in the same building with the rod mill engines.

A study of the power, fuel and water supply for this plant indicated that substantial economies could be derived through electrification of the steam-driven mills, coupled with centralized generation of electric power in a new power plant located near the blast furnace plant. The connection with the Alabama Power Co. was maintained for the purchase of power required in addition to that generated in the new power house.

Electrification of the rod mill is of interest, first, because it involves the use of five synchronous motors in a system of subdivided or group drives. It is a pioneer application of this type. It is of interest, secondarily, because of the combination of one of the driving motors with a direct-current generator to make up a motor-generator set which, in turn, supplies the direct-current motor driving the finishing stands.

Arrangement and sizes of the driving motors are shown in the diagram. Rather high-speed motors with gear drives are employed for the continuous group, for stand No. *7* and for the group comprising stands Nos. *13*, *14*, *15* and *16*. The gear set for the latter group is a special design enabling one motor to drive two parallel shafts. The motors driving groups made up of stands Nos. *8*, *9*, *10* and *11*, *12* are direct coupled. Where two or three successive stands are driven at the same rotative speed, adjustment in roll diameters is used to maintain the speed differential required by the differences in sectional area in the steel being rolled.

A motor of about 700-hp. capacity is required at No. *7* stand. The required pinion-speed, 86 r.p.m., permits the use of a geared motor at 720 r.p.m. This is a favorable speed for a motor-generator set. As such a set, or its equivalent, is required to supply direct current to the adjustable-speed motor driving finishing stands Nos. *17* and *18*, economy in first cost, as well as a slight gain in efficiency, dictated the combination indicated, wherein a 1000-kw. generator is coupled to the motor driving stand No. *7*, the motor size for this drive being increased to a total of 2100 hp.

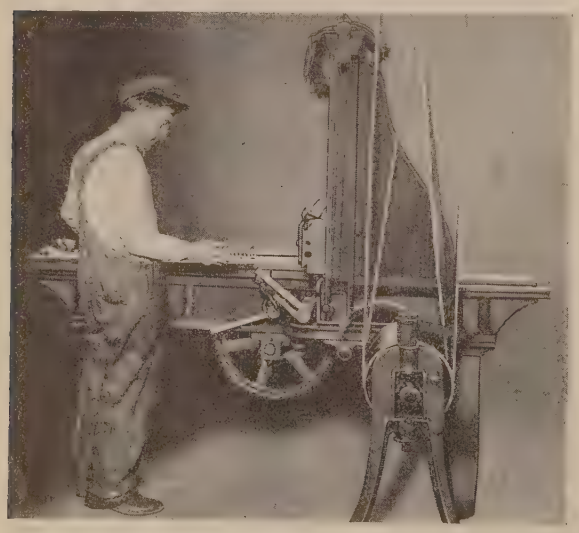
Layout of Rod Mill, Showing Shafting Speeds for Various Roll Stands

Heat Treating in Making Springs

Control of Physical Characteristics Necessary in Handling Steel Wire for Compression and Tension Springs

BY F. W. MANKER*

MOST of the raw material in the manufacture of coiled steel springs is wire. Most of this wire is heat treated at the wire mill in accordance with well established methods, before being shipped to the spring factory. But the spring maker is increasingly meeting consumer specifications which make it imperative for him to select unusual steels and alloys and to develop special heat treatments of his own.



Testing Springs for Solid Compression Under 3000-Lb. Pressure, to Remove Permanent Set

Among the springs which the Kokomo Spring Co., Kokomo, Ind., manufactures are those for counter-balances on garage and factory doors, and also for suspending the blades on road graders. These latter have a carrying capacity of 2800 lb. and weigh from 90 to 150 lb. each. This concern also puts out springs for about 100 different makes of trucks and tractors. Other items include automobile valve springs, agricultural implement springs, pump valve springs, phosphor bronze springs for steam pump valves, etc., and monel metal springs, sulphur dioxide resisting, for refrigerating machinery.

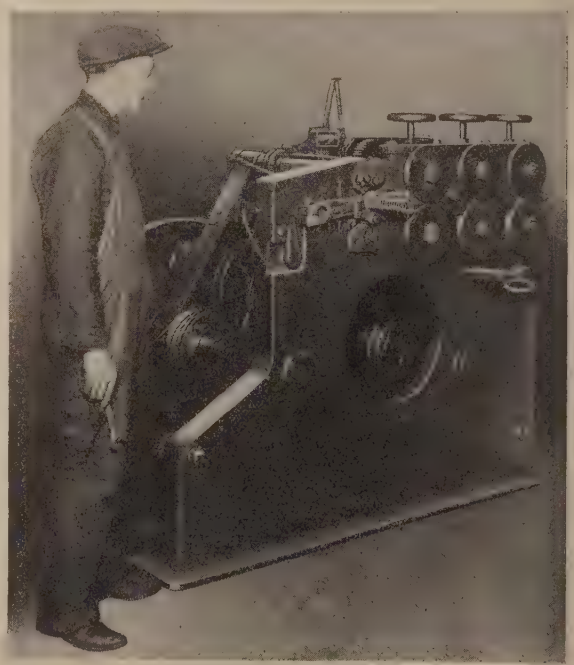
In designing springs the primary object is to secure continuous and intermittent deflection or movement of coils, without permanent set or stretching. Known supporting loads and definite deflections, the two variable factors encountered, bear a definite relation to each other. We might call them cause and effect, the load applied being the cause and the deflection the effect.

These are expressed in mathematical formulas, which include diameter of coil in relation to diameter of material used and number of coils, all governed by the fiber stress exerted and the tensile strength of the material used. These formulas show that the amount of angle or twist which a round bar is capable of producing under torsional movement is directly dependent upon the length of the bar or wire used in the spring, which in turn is controlled by the diameter and number of coils. Increasing either augments the factor of safety.

Increasing the size of material decreases the maximum fiber stress allowable, as all spring action is based upon the torsional or twisting action of wire. In other words, the greater the distance from the circumference of the bar to its center, the less twisting action will the bar safely stand. This is due to the greater movement of the outside fibers, which are in tension, as compared with that of the inside fibers which are, at the same time, in compression. The result is unequal strains and often failure of material.

Modulus of Elasticity Under Torsion

Carefully conducted tests show the modulus of elasticity of high or low-carbon Bessemer, open-hearth or crucible steel to vary from 25,000,000 to 30,000,000 lb. to the square inch under tension; but under torsion it amounts to only about 10,500,000 lb. This latter figure, together with a fiber stress of from 60,000 to 90,000 lb.



Automatic Spring Coiling Machine Used in Producing Springs at High Speed

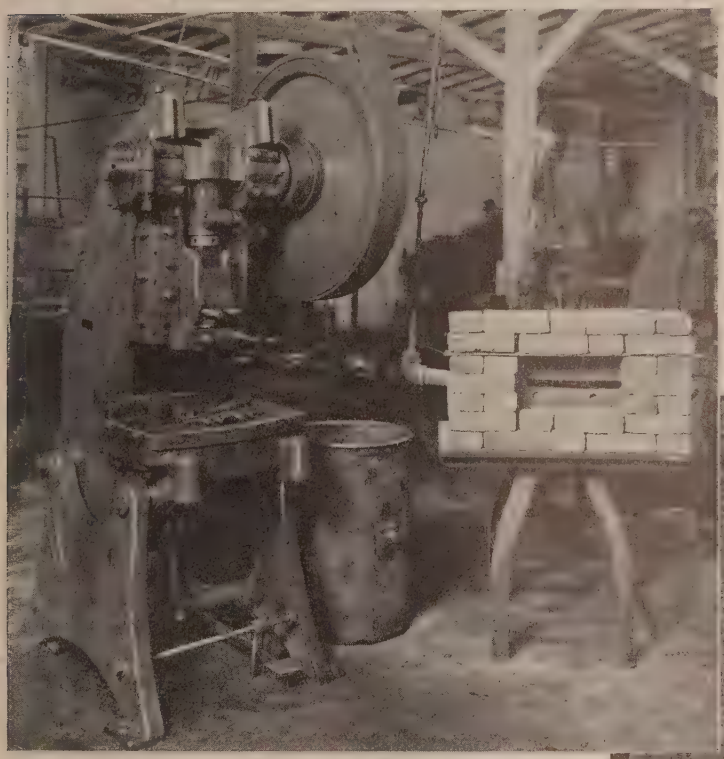
*Assistant to president, Great Lakes Steel Corporation.

to the square inch, is used in the formulas of this concern.

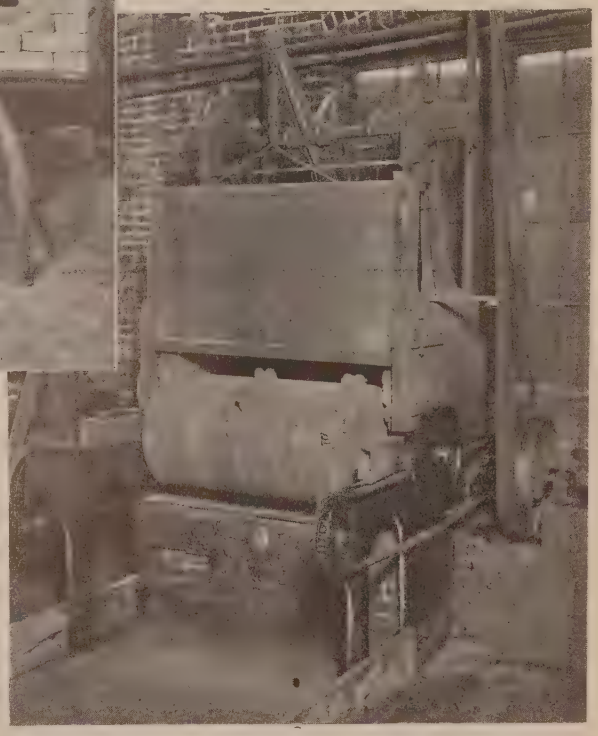
In extension springs of the overhead door type is another factor, initial tension, which is due to mechanical crowding of one coil against another, and varies from a quarter to a fifth of the total load carried by the spring.

Owing to the variation in the modulus of elasticity as shown, it is almost impossible for all springs to be absolutely uniform; hence a commercial variation of plus or minus 10 per cent is usually allowed. When closer tolerances are required it becomes necessary to test each spring as it is produced, rejecting those which do not meet the specifications. This is expensive.

The greater the fiber stress developed under working conditions, the shorter is the life of the spring. The theoretical fiber stress for an ideal spring is 70,000 to 80,000 lb. and with it a spring should withstand 2,000,000 workings without failure. However, for moderate use this company has made springs, from its own special-process material, which have a tensile strength of 190,000 lb., working under 125,000 to 140,000 lb. fiber stress, with satisfactory results.



USE Is Made of Several Portable Gas-Fired Forge Furnaces, as at Left, Placed Alongside the Presses. With this equipment one operator can make 2000 small steel forgings in 9 hr. Below is a gas-fired drawing furnace of the rotary drum type, in which the drum may be run out for discharging



Furnaces for Hardening and Drawing

The heat-treating department of this plant is equipped with modern furnaces and other equipment, using gas as fuel. There is a row of gas furnaces, used interchangeably for hardening and drawing, which are 7½ ft. long, 5½ ft. wide and 9 ft. high. They are fired with 14 gas burners located in each end, each battery of burners being manifolded to an inspirator. These units are of brick, suitably insulated and stayed, and were built and installed by the Surface Combustion Co., Toledo, Ohio. Automatic temperature controls and indicating pyrometers are used.

One drawing furnace is of the drum type, the drum setting in a brick, combustion chamber, heated with 11 gas burners, manifolded to an inspirator. The drum revolves in pillow blocks, the shaft being driven by a motor through a gear train. The pillow blocks run on steel tracks placed in the side walls and extending 4 ft. beyond the combustion chamber, to aid in discharging.

Two furnaces, back to back, serve the dual purpose of tempering or blueing and japan baking. An overhead monorail system serves both, running out of one, making a complete turn and traveling the length of both on the outside, and making another turn to run into the other. The tempering oven is carried at 650 deg. Fahr. After being tempered the work is removed on the monorail, cooled, dipped in japan and run into the japanning oven, where the japan is baked on at 400 deg. Fahr. Each furnace is heated with 14 gas burners and an inspirator.

Quench tanks serve the various furnaces, oil being the principal quenching medium. Water coils, immersed in these tanks serve to cool them and the tanks have water jackets also. In the summer ice water is used.

All springs manufactured from material up to 9/16 in. in diameter are coiled cold, but anything larger must be heated first. For this purpose forging furnaces fired with gas are used. One of these is 50 ft. long, 3 ft. wide and 5 ft. high and has 16 gas burners and an inspirator on each side. This unit is heated to 1500 deg. Fahr., and will hold 25 1-in. bars at a time.

There are also two portable forging furnaces which may be shifted from one punch press to another. One

operator can forge 2000 ⅜-in. steel forgings from one of these furnaces in a 9-hr. day. All the furnaces in this plant are equipped with inspirators of the venturi type, made by the Surface Combustion Co. These economize in fuel, afford a close temperature control and make possible any furnace atmosphere required, oxidizing, neutral or reducing.

Oil was used prior to the conversion to gas and the fuel cost for heat treating with oil was 29.4c. for each 100 lb. With gas this cost now runs between 19c. and 23c. for 100 lb. Furthermore, rejections of spoiled stock, which formerly averaged 5 per cent, now amount to less than 0.1 per cent.

Chrome-vanadium steel, S.A.E. 6150, as used in this plant, is of the following analysis:

Carbon	0.45 to 0.55 per cent
Manganese	0.50 to 0.80
Phosphorus	0.04 maximum
Sulphur	0.04 maximum
Chromium	0.80 to 1.10
Vanadium	0.15 minimum, with 0.18 desired

In heat treating this the stock is brought up to a temperature of 1500 to 1525 deg. Fahr. and soaked for 10 to 20 min. Quenched in oil, it is then drawn at 800 to 1100 deg. for from 20 min. to 2 hr., according to the cross section, qualities desired, etc. To relieve any remaining strains, this stock is reheated to 650 deg. Fahr. for 1 hr.

Automobile valve springs are coiled from hard-drawn, silico-manganese wire, S.A.E. 9250. The analysis of this steel is similar to the one given, except that silicon (1.80 to 2.20 per cent) takes the place of chromium and vanadium, and the manganese content is 10 points higher. The only heat treatment required for springs of this steel is tempering, after all cold-working operations have been completed.

About 75 per cent of the springs made in this plant are coiled from wire already heat treated. These springs are of the extension type, as contrasted with the compression type, and must have an initial tension of approximately one-fifth of the total carrying load. It has been found in practice that oil-tempered wire affords from 25 to 30 per cent more stretch or elongation after coiling than regular spring wire. In the construction of extension springs it is necessary to crowd the wire, to produce the desired initial tension; and were they to be heated to 1500 deg. Fahr. after coiling, this initial tension would be lost.

In making compression springs the factor of initial tension does not enter. Hence this type of spring can be either made from heat-treated stock or coiled from regular wire and heat treated afterward. Here the deciding factor is cost. Thus, for some of these springs 1020 S.A.E. steel is used, of the following analysis:

Carbon	0.15 to 0.25 per cent
Manganese	0.30 to 0.60 per cent
Phosphorus	0.045 maximum
Sulphur	0.05 maximum

After coiling, the springs are heated to 1425 to 1500 deg. Fahr. for a half hour, quenched in oil and drawn at 900 to 1100 deg. The time of the draw ranges from 20 min. to 2 hr., depending upon the cross section of the material, physical requirements, etc.

Special Manufacturing Equipment

A novel machine in this plant is an emery wheel grinder for grinding both ends of a spring at the same time, and at the rate of 25 a minute. It is automatic and hopper fed and will take springs from ¾ in. to 15 in. long. This machine is being rebuilt to increase its speed by at least 25 per cent, using rubber-bond disks instead of emery wheels.

In some instances the ends of springs must be annealed, to offset stresses set up by severe forming (sharp bends, etc.), and in others the ends must first be heated before being formed. For this purpose a cast iron box with small holes is used. The springs are inserted in the holes in such a way that only the ends protrude into the box, where they are heated with a gas torch.

There are machines which can be adapted to make closed or open coils, and special speed lathes for turning out long springs, operating at 1500 r.p.m. and producing springs 150 ft. long, if necessary. Long lines of automatic coiling machines are used, which form any kind of spring, with or without tapered ends, closed or open ends and of any length, from stock ranging from 0.006 to 9/32 in. in diameter. One of these will turn out 180 springs a minute from 0.006 to 0.032-in. material.

A long line of punch presses is used for cutting springs to any length, or for forming special ends, and other machines for looped ends and for special-shaped flat springs. All compression springs are pressed to remove permanent set and all are tested to the full load specified.

All of the above machines are designed and made by the company, except the automatic coilers. This concern maintains a testing laboratory, and research and engineering departments, for designing new kinds of springs and the machines with which to make them.

Southern Rod Mill Electrification

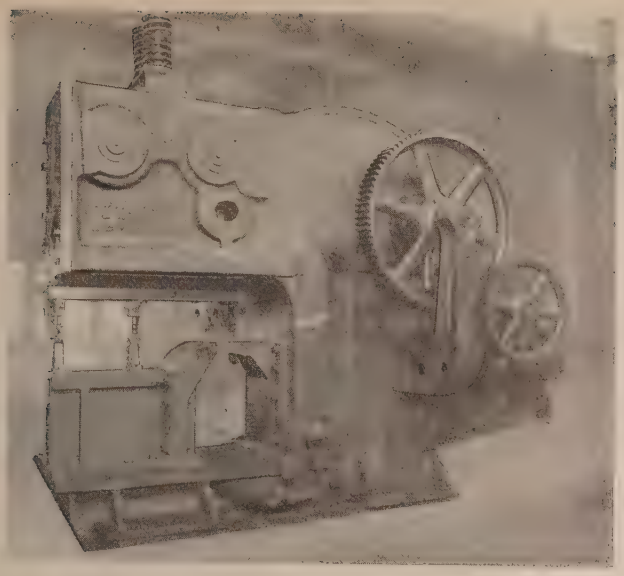
(*Concluded from page* 217)

Arrangements for starting and switching the synchronous motors are of interest. All of these motors, with the exception of the 2750-hp. unit, are arranged to start on full voltage, developing approximately full-load torque with three to four times full-load kva. The pull-in torque developed by these motors is about half of full-load value. The 2750-hp. motor is arranged to start normally with a reactor in series, to minimize the usual starting inrush. However, if the starting torque, under reduced voltage, should be deficient, as on a Monday morning, full voltage can be applied with no ill effects other than the high starting inrush.

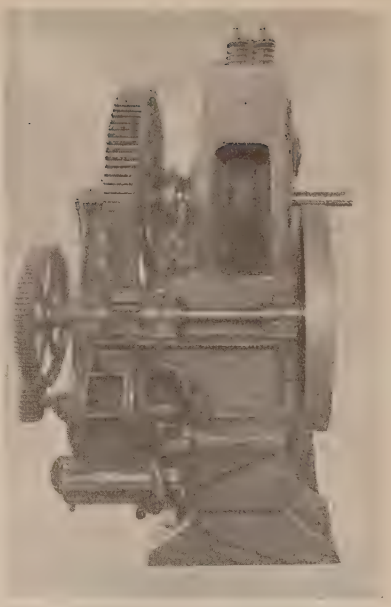
As these motors run almost entirely in one direction, the ability to back off being seldom required, it was not thought necessary to supply individual forward and reverse oil circuit breakers for them. Each motor is provided with a single breaker. A set of reversing disconnects is provided ahead of the bus supplying the entire group of synchronous motors.

This rod mill is provided with seven reels. Finishing at about 1600 ft. a minute, six strands are closely maintained, resulting in an average output of about 350 tons on a 12-hr. turn. The power consumption of the main roll drives, electrically driven, is about 200 kwhr. for a gross ton of product. This compares with a consumption of about 13,000 lb. of steam an hour used by the engines which formerly drove the mill. The reduction in operating and maintenance labor represents a marked economy in costs.

Pearlitic cast iron is being used to an increasing extent to replace cast steel and cast iron by British engine builders, if exhibits at the recent North-East Coast Exhibition may be taken as a criterion. So-called Lanz-Perlit fire bars were shown to be sound and unchanged in shape after 16 months of service in a boiler, whereas the life of ordinary gray iron castings would be only three months. Impact strength of the improved iron measured by blows to fracture is eight times that of the ordinary. Hardness is uniform, varying from the normal of 190 Brinell but slightly even in castings ranging from ¾ to 2½ in. thick.



USE of Two Toggles Permits Application of Pressure at Two Points on the Ram and Is Claimed to Reduce Power Requirements. The motor and all driving mechanism are mounted on the frame as shown in view at right



Beam Punch with Toggle-Operated Ram

BEAM punches for structural shapes and plates, differing from usual design in that a pair of toggles transmit pressure to the ram, are being built by the Beatty Machine & Mfg. Co., Hammond, Ind. Special features are that the ram is designed without overhang and it is guided throughout its full length. Use of two toggles affords application of pressure at two points on the ram, reduces the size of driving gears and is claimed to reduce power requirements. These machines will be built for ram pressures ranging from 150 to 600 tons.

To add strength to the head of the punch, the main body extending up in the housing has been made the same length as the face or space for tooling. The toggles are operated by a connecting rod which leads to the main shaft. This shaft extends through the frame at right angles to the face of the head and is fitted with an automatic stop clutch. The driving gears are assembled on the housing, thereby making for economy of floor space. The punch is of steel construction throughout, with slide bearings bronze lined and all shaft bearings bronze bushed and fitted with a single-shot force-feed lubricating system.

The machine illustrated has a stroke of 3 in. and exerts 400 tons' pressure. It will punch four 1⅞-in. holes through 1-in. material in cluster at any point at front or back of head. The length of head, front to back, is 60 in., and right to left, 12 to 40 in. as required. The die space, or distance from the face of the head to the table, stroke down, is 48¾ in.

Wheels and Casters for Industrial Trucks

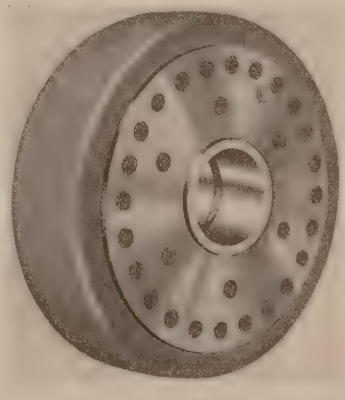
THE Metzgar Co., Grand Rapids, Mich., has added to its line of end-grain wood truck wheels for warehouse, hand and trailer trucks, a "super-strength" type for use on hand-lift and other trucks subjected to unusually heavy service.

In all types—standard, heavy-duty and "super-strength"—the wheels are made up of a number of hardwood wedges of equal size securely bound together with circular steel bands. These bands, with the hub flanges, are laid deep enough in the wood to provide the necessary radial strength, and are fastened by rivets which extend through each wedge. The butt ends of the wedges are surfaced, forming an end wood tread that is said to have wearing qualities comparable to a butcher's block. Various hub arrangements can be furnished.

Heavy-Duty End-Grain Wood Truck Wheel with Hyatt Roller Bearings

The wheels can be equipped with either oil-less end-wood plain bearings, or Hyatt roller bearings. The entire wheel is impregnated with a suitable lubricant, and this, in addition to the end wood presented to the axle, is said to provide a plain bearing that will last indefinitely in ordinary trucking operations. Micrometer measurements taken after several months' service are said to show no appreciable wear of either the end-wood bearings or the axles with which they are used. If desired, however, Alemite-Zerk lubrication can be furnished for the plain bearing wheels. Roller bearing wheels are recommended when higher speeds and easier rolling than usually obtainable with plain bearings are required. These bearings are regularly equipped for Alemite lubrication.

The standard type end-grain wood truck wheel is made in a range of sizes from 2½ to 20 in. diameter, inclusive. The rivets in the side plates are countersunk to make both sides of the wheel perfectly flush, so that less space is required in the horns when the wheels are used in swivel or rigid casters. Compression tests of 10-in. diameter, 3-in. face wheels of standard



"Super-Strength" Wheel for Hand-Lift and Other Unusually Heavy Service Trucks

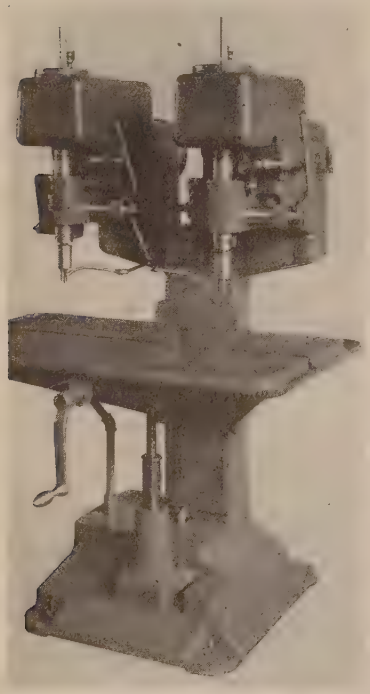
type are said to have withstood a load of 21 tons.

For heavier service than usually required of two-wheel warehouse trucks and four-wheel platform trucks, the heavy-duty type wheel having double the number of wedges and rivets is recommended. Sizes range from 6 to 20 in. in diameter, and up to 6 in. in face width, the 6 to 9 in. wheels being of plate type and larger sizes of band type. They are made in a wide range of hub lengths and to fit any size of axle.

End-grain wood wheel casters are manufactured by the company in both rigid and swivel types for a variety of industrial applications.

New Semi-Automatic Tapping Machine

TO eliminate tap breakage, a multiple-disk friction clutch is incorporated in the spindle drive of the semi-automatic tapping machine illustrated, single and multiple-spindle types of which are being built by the Rickert-Shafer Co., Erie, Pa.



Work May Be Tapped to a Predetermined Depth and Means Are Provided to Eliminate Tap Breakage

For production on an automatic basis, a block on a serrated cam located on the left-hand side of the spindle housing may be set to permit tapping to a predetermined depth. Pulling the handle downward engages the clutch and causes the tap to advance into the work. When the required depth is reached the block on the serrated cam trips the mechanism so that the clutch is released in one direction, setting in operation a train of gears which reverses the spindle and backs the tap out of the work. A slight upward thrust on the handle then reverses the mechanism for tapping the next piece. On work of ordinary type one operator can keep two spindles going full time.

The machines can be furnished for either belt or motor drive. Pump and other equipment for supplying coolant or oil to the taps is provided and the arrangement is such that the overflow is returned to the reservoir in the base of the machine. It is stated that the machine has been tested in tapping up to 1-in.—8 U.S.S. threads without signs of being overloaded.

Cut-Off Saw for Brass and Bronze Bars and Shapes

BRASS and copper bars 3-in. in diameter are cut-off in from 3 to 4 sec. by the machine illustrated, which has been developed by the Hunter Saw & Machine Co., Pittsburgh, for cutting off brass, bronze and copper shapes, solid and tubing. Angular as well as straight cuts can be made on the machine, the capacity of which is for material up to 3 in. in diameter.

The 10-in. diameter saw blade is mounted on a balanced tilting frame and is fed through the material by means of an offset hand-lever, the work being held in a quick-acting eccentric vise. The saw blade is driven by a 3-hp. motor through roller and chain and sprockets, and runs at a peripheral speed of 1300 ft. per minute.

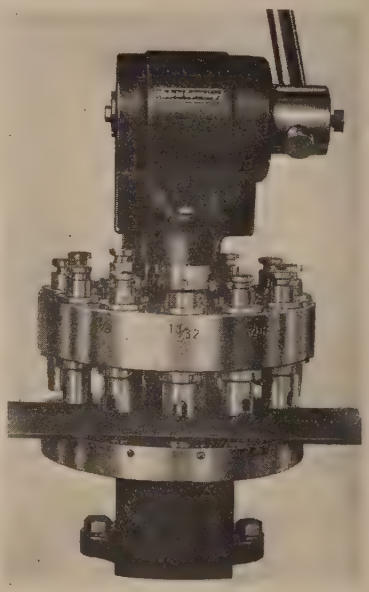
The Saw Blade Is Driven by a 3-Hp. Motor Through Silent Chain and Operates at 1300 F.P.M.

Means are provided for keeping the chain at proper working tension. The motor and starter are inclosed in the base of the machine. The saw guard is arranged to tilt out of the way to facilitate removal of the saw blade.

Floor space of 24 x 48 in. is occupied and the height of the machine is 45 in. overall. The height to the table is 31 in. The net weight of the machine, which is designated as the Model No. 4, with standard motor and starter, is 950 lb.

Will Punch 12 Different Size Holes

TO meet a demand for a portable machine ready at a moment's notice for punching holes of a range of common sizes, the Eda multiple punch here shown has been built. It covers any one of 12 sizes ranging from ⅛ to ½ in. and is designed rigid enough to pierce steel of machinery grade up to 3/16 in. in thickness. The punches and dies, which are simple, are mounted on a freely revolving turret, an automatic ball stop catching the turret at the moment that a desired size punch and die are central under the ram. Angle and tee sections up to 1¾ in. are included within the scope of the punch.



Holes from ⅛ to ½ In. May Be Punched in 3/16-In. Steel. The weight is 100 lb.

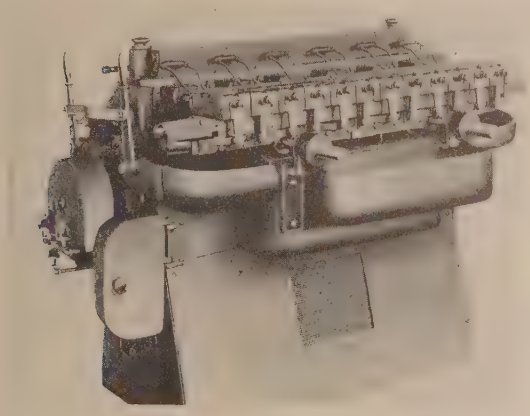
The machine, which weighs under 100 lb., is marketed by the Wiedemann Machine Co., 1815 Sedgley Avenue, Philadelphia.

Electric Furnace for Heat Treating Aluminum Sheets

The Fairmont Mfg. Co., Fairmont, W. Va., producer of aluminum sheet and castings, is installing a large electric heat-treating furnace. The equipment will be used chiefly in heat-treating aluminum-alloy sheet. Dr. Robert J. Anderson, vice-president of the company, states that the new furnace will be in operation by about Sept. 1.

Multiple-Spindle Driller Uses Cluster Drill Heads

FOR either single or cluster head work the Kent Machine Co., Cuyahoga Falls, Ohio, is bringing out a new horizontal drilling machine which is similar to its No. 1 six-spindle unit, but is larger and heavier and incorporates new features, including the cluster drilling mechanism. It is built with six single spindles on 7½ in. centers or with six special cluster drill heads on 7½ in. centers.



THE Single and Cluster Drill Heads Are on 7½-In. Centers. Twelve fixtures are required, two for each drill head, and six of them are loaded while six others are being drilled

Fixtures may be designed to accommodate a wide variety of work. Either belt or motor drive is furnished, the motor for the latter being mounted on a movable angle plate in the base of the machine to facilitate adjusting the tension of the driving chain and the changing of sprockets to vary the speed of the machine.

The rate of production is governed by the r.p.m. of the camshaft, which is controlled through a series of change gears and adjustable dogs. With this combination it is possible to synchronize the speed of machine with the ability of the operator to load and unload the fixtures. Feed of the drill is controlled by a feed cam and may be varied to suit requirements by changing the gears which control the camshaft speed.

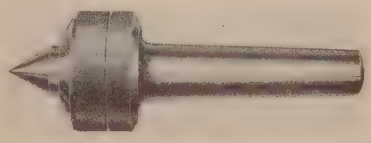
Twelve fixtures are required, two for each drill head. These fixtures alternately occupy positions in front of and between the drill heads. When in line with the drill heads, they are automatically locked, and when in the alternate position they are opened to permit unloading and loading. Thus, while the drill table moves forward for the drilling, six fixtures are filled by operator while six other fixtures securely hold the parts being drilled.

Live Center for Use with Tungsten Carbide Tools

A HEAVY-DUTY live center, said to be suitable for use in connection with lathes and other machine tools using tungsten carbide cutting tools, is pictured herewith.

This device, manufactured by Nielsen, Inc., Lawton, Mich., consists of an outer tapered sleeve, an alloy-steel heat-treated center mounted in double-row ball bearings at the front and in a roller bearing at the rear, and a knurled front cap containing at its forward end a felt seal. The center and its bearings run in oil that is supplied through oil holes at the front and rear of the tapered sleeve. The knurled front cap permits convenient removal of the alloy steel center, while the felt seal is intended to prevent entrance of dust or grit into the front bearings.

The tool, designated as the D.R., is regularly made in a Morse taper series, embracing eight sizes from No. 3 to No. 7, and a Jarno taper series of 15 sizes, from No. 6 to No. 20. The overall width and length of the Morse taper series ranges from 2¼ in. x 6 5/16 in. to 9 in. x 20 in. and of the Jarno taper centers from 2¼ in. x 5 13/16 in. to 5 5/16 in. x 16 in. The radial and thrust load sustained by the Morse taper series ranges from 600 to 29,000 lb. per sq. in. per 100 r.p.m. The standard included angle of the center point is 60 deg. Special tapers and points can be furnished to order.



Anti-Friction Bearings Are Used Front and Rear. The knurled front cap contains a felt seal at its forward end

In a recent test of one of the No. 6 centers at the Case School of Applied Science, Cleveland, in connection with a lathe using a tungsten carbide tool, cast iron was cut at 500 ft. per min., the depth of cut being ⅝ in. and the feed 0.037 in. Steel containing 0.50 per cent carbon, 0.75 per cent chrome and 1.5 per cent nickel was cut at 200 ft. per min., the depth of cut being ¼ in. and the feed 0.037 in. It is claimed that in both cases the center withstood the load without chatter.

Completes Investigation of Machinists' Vises

AN investigation of the efficiency of various weights of machinists' vises has been completed by the Bureau of Standards. The relationship between size of vise and its efficiency was determined by performing typical shop operations on steel specimens held in the vise. These operations consisted of sawing, bending and riveting, and were carried out under carefully standardized conditions, using 12 vises of the stationary bottom type having different lengths of jaw from 2 in., 9 lb., to 9 in., 282 lb.

Static tests, such as sawing, in which the movement of the tool was large compared with the movement of the vise, showed no appreciable difference in the efficiency with which the work was performed. In the dynamic tests, however, such as riveting and some of the bending tests on large specimens, the weight, or inertia, of the vise had an appreciable effect on the efficiency with which the work was performed. The efficiency of the 5½-in., 102 lb., vise was greater than for any of the lighter vises, but was about the same for larger vises. Complete results of this investigation will be published by the Department of Commerce in the near future.

Dual Buffer with Independent Spindle Control

TWO separate and distinct spindles, each operated by its own motor, feature a dual-motored Tex-drive buffer made by the Hisey-Wolf Machine Co., Cincinnati. Either spindle may be operated independently of the other. This arrangement makes it possible to have the two spindles operating at different speeds at the same time.

This new buffer is of gooseneck design, which gives the operator great freedom of movement and permits easy handling of large and bulky pieces. Accessibility of all parts and rigidity of construction are incorporated. The base consists of a substantial casting inside of which are motor, starter and starting switch.

Spindle and bearing housing are assembled as a unit. The entire unit may be quickly removed from the base by loosening four bolts on each side. This arrangement simplifies the problem of removing a worn or broken belt and replacing it with a new one.

Spindle bearing boxes are cast iron and are keyed to the column. A key along the entire base of bearing housing fits into a keyway in top of the column. Thus, no matter how often the bearing housing is taken off, the keyway arrangement insures perfect realinement of spindle and motor pulleys. Automatic lubrication is obtained by a simplified oiling system.

General Mileage Scale for Cast Iron Pipe

WASHINGTON, July 22.—The Interstate Commerce Commission, in what is known as the Krupp Foundry cast iron pipe scale, has ordered the railroads to use the mileage scale prescribed in the so-called Hoch-Smith iron and steel case, for the removal of undue prejudice against founders at Lansdale and Quakertown, Pa., and Florence, N. J., and undue preference for founders in the Birmingham, Chattanooga and Knoxville districts.

In the original decision in the Krupp case the regulating body designed a scale, but did not prescribe it by definite order, to be used by the railroads in measuring the difference between the rates from shipping points of the Eastern founders and the shipping points of the Southern founders to the same destinations east of the Mississippi River and north of the Ohio.

Commissioner Porter, who wrote the report in which the revision of the original Krupp report was made, said there was no reason why the scale prescribed in the general iron and steel case, applicable throughout the territory north of the Ohio and Potomac rivers and east of the Mississippi, should not be used. But the scale in that case was not long enough. Therefore it was lengthened from 1200 to 1500 miles. The added distance of 300 miles is divided into alternate 35 and 30-mile blocks. One cent per 100 lb. is added for each block so that at 1500 miles the lengthened scale, to be used in calculating the differences in rates, is 65c. per 100 lb.

The result of the use of this scale is that the differences at the competitive points will be somewhat less than they would have been had the scale suggested but not ordered in the original Krupp report been put into use.

Swedish Bearing Industry Expanding

Production of ball and roller bearings in Sweden has expanded rapidly during recent years, according to E. J. Cochrane, industrial machinery division, United States Department of Commerce, the 1928 production being estimated to have reached between 33,000,000 and 35,000,000 Swedish kroner ($8,844,000 to $9,380,000), compared with 24,167,000 ($6,476,756) in 1926 and 26,524,000 ($7,111,432) in 1927.

As only a small part of this production can be used in Sweden, outlet for the balance must be found abroad. In this Swedish manufacturers have succeeded in increasing their foreign sales from some 23,409,000 kroner ($6,271,200) in 1925 to nearly 33,000,000 kroner ($8,844,000) in 1928. In Europe, Germany, Russia, the United Kingdom, France, Belgium and Czechoslovakia constitute the best customers. On the North American continent, both Canada and the United States are excellent markets, and in South America and Asia, Argentina and Japan, respectively, are the heaviest buyers.

Manufacture of ball and roller bearings in Sweden is practically confined to four companies, namely the A/B Svenska Kullagerfabriken (S. K. F.), Goteborg; the A/B Nafveqvarns Bruk, Navekvarn; the A/B Abjorn Anderson, Svedala; and the Skogsfors Bruks A/B Reftele. Of these the A/B Svenska-Kullagerfabriken (S. K. F.), Goteborg, is the largest. This company was established in 1907 and owns 12 factories, four of which are located abroad, in the United States, England, France and Germany respectively. In addition, it has 187 sales branches scattered throughout the world.

Central Alloy Reduces Prices on Nirosta Steel

The Central Alloy Steel Corporation has announced substantial price reductions on Enduro Nirosta steel, covering all forms in which the material is produced. Central Alloy is working toward greatly increased output of stainless steel in response to rapidly growing buying interest in many lines, including the automobile and building industries. The present price reduction, it is stated, is the first step in the company's policy to stimulate consumption by lower quotations as the volume of output expands.

Gearing Advertising to Selling

"Gearing Advertising to Selling" will be the theme of the eighth annual convention of the National Industrial Advertisers Association to be held in Cincinnati, Sept. 30, Oct. 1 and 2, it has been announced by Jesse R. Harlan, chairman of the convention committee of the Cincinnati Association of Industrial Advertisers. Sherman Perry, American Rolling Mill Co., Middletown, is chairman of the program committee.

Officers of the national organization are: Nelson S. Greenfelder, Hercules Powder Co., Wilmington, Del., president; George H. Corey, Cleveland Twist Drill Co., Cleveland, first vice-president; Allan Brown, Bakelite Corporation, New York, second vice-president; H. von P. Thomas, Bussman Mfg. Co., St. Louis, third vice-president, and Benjamin H. Miller, Permutit Co., New York, secretary and treasurer.

American Pulley Co. Buys Sprucolite Line

The American Pulley Co., Philadelphia, manufacturer of pulleys, steel hangers and hand trucks, has taken over all products of the Sprucolite Corporation, Bloomfield, N. J., embracing various types of pulleys. The new line, to be called American Sprucolite pulleys, will be marketed through mill supply houses.

Engineering Meeting at Akron in October

A meeting of the American Society of Mechanical Engineers will be held in Akron, Ohio, Oct. 21 to 23, at the Portage Hotel. Eight sessions are being planned under the auspices of the professional divisions and standing committees on the following subjects: Applied mechanics, materials handling, education and training for the industries, aeronautics, steam power, iron and steel, and management.

A dinner, followed by a smoker with entertainment, is being arranged at the Firestone Club House for Monday evening, Oct. 21, and a banquet at the Portage Hotel for Tuesday evening. Inspection trips planned cover the plants of the Firestone Tire & Rubber Co., the Goodyear Tire & Rubber Co. and the B. F. Goodrich Co.

Steel Frame House to Be Built in 100 Days

Moving into a house 100 days after the digging for the foundation was started is an achievement which will be demonstrated this month at Indianapolis, where a steel frame house will be erected by the Steel Frame House Co., a subsidiary of the McClintic-Marshall Co., Pittsburgh. The house, consisting of eight rooms, two baths and garage, will measure about 40,000 cu. ft. The contractor will be an assembler, for the materials will be fabricated in plants at some distance from the house while the foundation is being built and will be shipped to the site ready for erection.

The house will demonstrate the durability and economy through speed of erection that is possible with steel framing. The Steel Frame House Co. has built or is building similar houses in Philadelphia, Lancaster, Pa., Rochester, N. Y., Toledo, Ohio, and Columbus, Ohio. The plans for the Indianapolis structure were made by Frederick Wallick, Indianapolis architect.

Will Make Bartlett-Snow Equipment in England

Pneulec, Ltd., Mafeking Road, Smethwick, near Birmingham, has been given exclusive selling and manufacturing rights in the British market for Bartlett-Snow special machinery for handling sand, molds, cores and castings. Among these products are conveyors and elevators of many types, screens, magnetic separators, sand conditioners, pug mills, blenders, sand hoppers, gates, feeders, core crushers and cupola charging units.

S. G. Taylor Chain Co., Hammond, Ind., is preparing for distribution a catalog which has eliminated many items in conformity with the company's simplification program. It will give information relative to sling chains, especially as to diameter and dimension of joiner and end links.

Plans Outlined for Distribution Census

Business Men's Group Appoints F. M. Feiker of Associated Business Papers, Inc., as Chairman

A GROUP of business men which will aid the Government in the census of distribution to be taken next year by the Department of Commerce met in Washington on July 17 to draw up preliminary plans for the collection of what was described as "vitally essential statistics."

F. M. Feiker, managing director of the Associated Business Papers, Inc., was named chairman of the group. In discussing the work before the committee, Mr. Feiker said there seemed to be six important objectives in the minds of business men and economists who have given the distribution census consideration. He described these as follows:

1. To provide a statistical picture or count of the number of distributers classified as to class, as to size, as to number of employees, as to the volume of business. Such a count or census of distributers forms the simplest picture of the outlets for distribution between the consumer and the producer. There is at the present time no such picture and the contemplated census of distribution should include the first simple objective.

2. A count and classification by establishments of the volume of sales in various commodities to be classified by commodities, by geographical units, by volume of sales as related to size of establishments, etc. It is obvious that a discussion and clarification of this objective is essential before consideration can be given to the detailed contents of schedules.

3. The use of the statistics briefly summarized above from the point of view of those who produce commodities, i. e., from the point of view of their use for establishing market possibilities and sales quotas both by groups of producers and by individual producers. Much of the demand for a census of distribution comes from producing groups such as manufacturers, sales and advertising organizations which seek to use the distribution statistics to advance the economical distribution of their particular commodities, both raw materials and manufactured products. This objective also includes a consideration of the distribution of goods from manufacturer to manufacturer and a consideration of the problems of a census of distribution of manufactured commodities.

4. The consideration of the use of distribution statistics by trade association groups representing wholesale, retail and service outlets which seek to analyze the relation between their volume and the volume of other commodities or between the sectional demands existing within the distribution of one class of commodities. There have grown in increasing volume broad problems of competition between industries, one commodity competing with another for the consumer's dollar. There is basic need for considering therefore relative present sales in lines of commodities on the part of the distributer of those commodities as well as on the part of the producer. If practicable, a distribution census should be projected which would allow totals to be classified in a way to produce comparative figures of this sort.

5. The use of the statistics by the individual distributer or producer who seeks to make comparison between his own volume of business and the volume of business of his group either considered nationally or, in the case of the retailer, locally. It is obvious that the average business man would like to see a census of distribution established this year which would enable him to make such comparisons.

6. There remains the public value of the assembly of such statistics as are proposed whereby social or economic groups having as their objective studies in living costs or housing costs, living standards, etc., would seek to find in these statistics totals for comparison which they could put to broad public use.

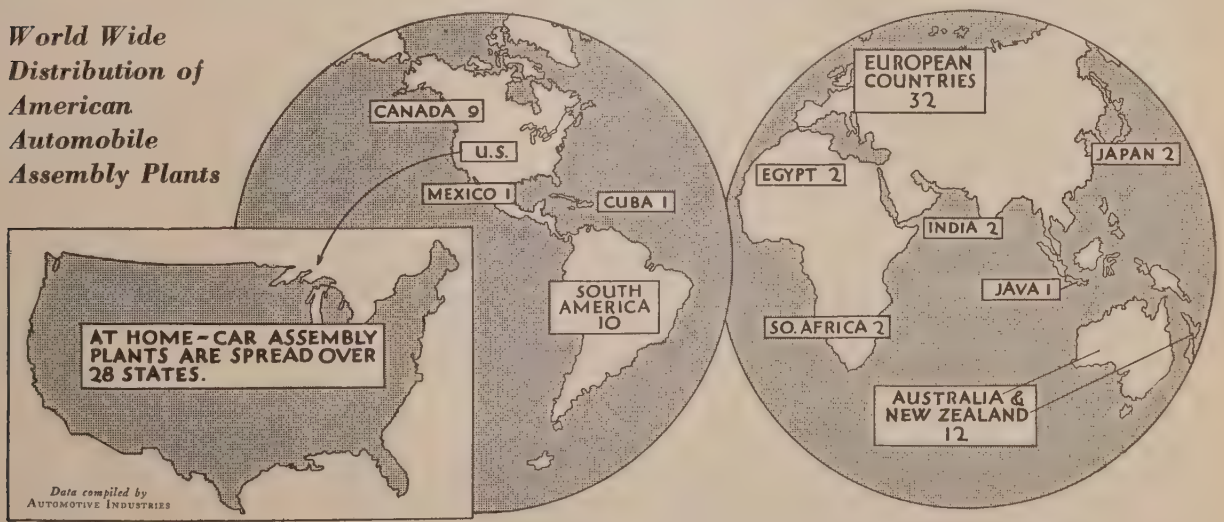
An Appreciation of The Iron Age

An appreciation of this journal appeared in the Chicago *Daily News* of July 12 in connection with a brief article devoted to Alvin I. Findley, editor-in-chief. What that newspaper had to say of THE IRON AGE is in part as follows:

"Its weekly market service is well known and has been one of the most trustworthy indexes of business. This service is not intended as a forecast; it aims primarily to picture current conditions in the iron and steel markets as they are each week.

"THE IRON AGE market service is the fruition of many years of cultivation. Technique of reporting had to be developed and an antagonistic psychology had to be overcome. The importance of publishing facts, instead of optimistic exaggerations, was not appreciated when business men believed that sentiment was a controlling factor in influencing trade conditions. No one has done more than Mr. Findley in breaking down these obstacles and in unswerving devotion to unbiased, uncolored news."

World Wide Distribution of American Automobile Assembly Plants



THERE are 72 plants in countries outside the United States, scattered through Canada, South America, Europe, Africa, India, Japan, Australia and New Zealand in which native labor is employed to assemble American motor cars. These plants turn out more than one-third of all of the cars made throughout the world outside the United States. According to a survey by A. B. Crofoot in *Automotive Industries*, there are 155 assembly plants for American cars, 87 of them within the United States.

Heavy Orders for Fabricated Structural Steel

Orders for fabricated structural steel in June are reported by the Department of Commerce at 92 per cent of monthly capacity, the computed tonnage having been 354,200. This is an increase of 2 per cent over the May total of 346,500 tons, and has been exceeded only once—by the 358,500 tons of March last. An equal tonnage, however, was reported for August, 1928. The current figure compares with 296,450 tons for June, 1928.

Shipments fell off markedly in June, having been only 273,350 tons computed, compared with 311,850 tons in May. While the June total was the smallest since February, it showed a gain over the 261,800 tons of June, 1928.

For the first half-year new orders are computed at 1,936,500 tons, compared with 1,570,800 tons last year. The gain represents 23 per cent. Similarly, shipments in the half-year were 1,686,300 tons, compared with 1,424,500 tons last year. This shows a gain of 18½ per cent.

Iron and Steel Traffic on Rivers Gaining

River traffic in iron and steel products on the Ohio River amounted to 116,679 tons during June, compared with 102,162 tons in the preceding month and 96,156 tons in June, 1928, according to the figures of the United States Engineer Office, Pittsburgh. On the Monongahela River, June commerce in steel products totaled 116,157 tons, compared with 88,340 tons in May and 75,422 tons in June, 1928. June steel movement on the Allegheny River was 722 tons, against 525 tons in the preceding month and 2350 tons in June, 1928.

Production of Malleable Castings Falls Off

Production of malleable castings in June is reported by the Department of Commerce at 71,055 net tons, a decline of more than 12 per cent from the 80,901 tons of May and the smallest tonnage for any month so far this year. It compares, however, with 67,090 tons in June, 1928, showing an increase of 6 per cent from last year.

Shipments in June were 71,311 tons—smaller than that for any previous month this year, except February. This compares with 79,885 tons in May and with 66,737 tons in June, 1928.

Orders booked in June, at 64,581 tons, made the smallest total for any month this year. This compares with 76,673 tons in May and with 61,071 tons in June, 1928. Capacity was operated in June to the extent of 73.8 per cent, compared with 83 per cent in May.

For the first half-year, production was 466,396 tons, which represents an increase of 18 per cent over the 394,876 tons last year. Shipments were 461,839 tons, showing a gain of almost 20 per cent over the 385,228 tons of last year. Orders booked totaled 463,700 tons, an increase of 21 per cent over the 384,009 tons of last year.

Consumption of Lake Superior Ores

Ore from Lake Superior consumed in June is reported by the Lake Superior Iron Ore Association at 5,676,652 gross tons. This is a reduction of more than 5 per cent from the 5,980,248 tons consumed in May. It shows an increase, however, of about 21½ per cent over the 4,667,493 tons consumed in June, 1928.

Ore on hand July 1 amounted to 23,701,011 tons. This is an increase of more than 3 per cent compared with the 22,980,603 tons of July 1, 1928. The current figure includes 19,618,611 tons on hand at furnaces and 4,082,400 tons on Lake Erie docks. This ore serves a total of 264 furnaces, of which 196 were in blast on May 31 and 197 on June 30.

Canadian Automobile Production in 1928

Eleven companies operating 14 factories were engaged in making automobiles in Canada in 1928, according to a bulletin of the Dominion Bureau of Statistics. Production made a new high record at 242,054 cars, valued at $149,177,000 wholesale. The output was 18 per cent greater than in 1926—the previous best year—and the value was 22 per cent higher.

Complete passenger cars made in 1928 numbered 176,096, of which 77 per cent were closed. In addition, chassis for passenger cars numbered 21,752. Complete trucks made numbered 17,527, showing a sharp decline from the 29,603 of 1927. Truck chassis to the number of 26,679 were produced.

Production and Shipment of Raw Materials and Finished Products

	June, 1929	May, 1929	June, 1928
By-product coke (a), net tons	4,509,564	4,664,242 (b)	3,961,268
Beehive coke (a), net tons	721,500	597,400	301,600
Total coke (a), net tons	5,231,064	5,261,642	4,262,868
Total coke (a), daily average	179,179	172,585	143,642

(a) United States Bureau of Mines.
(b) Highest total for any month.

Foundry Equipment Orders Up Slightly in June

Foundry equipment orders in June were slightly in excess of shipments, according to reports received by the Foundry Equipment Manufacturers' Association from 19 of its members. June net orders stood at 177.3, the base of 100 representing the average for 1922, 1923 and 1924. Unfilled orders were 300.8 at the end of June, or nearly double the June shipments, which were on the basis of 172.7.

Increase in Commodity Prices

Wholesale prices of commodities are reported by the United States Bureau of Labor Statistics at 96.4 in June, compared with 95.8 in May and with 97.6 in June, 1928. All figures are based on 100 as the average of 1926. Five of the 10 major groups showed increases in June, compared with May, and five showed decreases.

Increases were registered by farm products, foods, hides and leather, fuel and lighting and the miscellaneous group; decreases by textiles, metals, building materials, chemicals and drugs and house furnishings. In no case did the decrease of any group exceed one unit, but some of the increases were considerably more than that.

Metals and metal products dropped from 105.2 to 105.1, through declines in the iron and steel figure from 98.4 to 98.2, and in non-ferrous metals from 104.9 to 104.8. There were no changes in the figures for agricultural implements, automobiles or the other metal products. Building materials showed a slight decline, caused mainly by drops in prices of lumber and bricks. The structural steel element for building materials remained at 99.6, as for the preceding month.

Canada's Pig Iron Output 518,557 Tons in Half Year

Production of coke pig iron in Canada during June amounted to 89,873 gross tons, according to a statement issued by the Dominion Bureau of Statistics at Ottawa. This tonnage, while slightly under the 97,379 tons produced in June of a year ago, was the second highest reported for the current year to date, being 9 per cent over the total of 81,464 tons in May and only exceeded by the 93,939 tons of February.

For the six months ended June 30, 1929, the cumulative production of pig iron in Canada was 518,557 tons. This tonnage replaced the figures for the corresponding period of 1918 at 501,000 tons as the second highest on record and was only 1 per cent under the high level of 524,000 tons, which was established in the first half of 1917. During the first six months in 1928, production amounted to 468,013 tons. Output for the half year under review included 401,758 tons of basic iron, 87,052 tons of foundry iron and 29,747 tons of malleable iron.

This Issue in Brief

Skilled labor shortage is inevitable unless apprentice-training is more extensively adopted. United States has 4½ million skilled mechanics. To maintain this number at least 675,000 apprentices should be in training. Actually, less than 200,000 are being trained.—Page 203.

* * *

Economic weather signals. Average commodity price advanced in June to 96.4, compared with 95.8 in May and 97.6 in June, 1928. Orders for fabricated structural steel were heavy for June, being 92 per cent of capacity, a gain of 2 per cent over May.—Page 226.

* * *

Cadmium - plating, tin - coating and other processes are succeeding galvanizing in many plants manufacturing aircraft parts. Now chromium-plating for exposed parts made of aluminum alloy is being considered by manufacturers.—Page 214.

* * *

Are you wasting valuable storage space on patterns you will never use again? Value of pattern should be balanced against storage cost. Often it is more economical to replace an occasional pattern than to invest thousands of dollars in storage facilities for patterns not being utilized.—Page 215.

* * *

Electrification of rod mill involves use of five synchronous motors in a system of subdivided or group drives. One motor is combined with a d.c. generator to supply current for the motor driving the finishing stands.—Page 217.

Heat-treating fuel costs cut 22 per cent in spring plant. Gas fuel also reduces rejections from 5 per cent to less than 0.1 per cent.—Page 220.

* * *

Tungsten-carbide tool cuts cast iron at rate of 500 ft. a minute. Depth of cut was ⅝ in., and feed 0.037 in. Lathe was equipped with heavy-duty live center, made especially for use with tungsten-carbide tools.—Page 223.

* * *

Big market for fuel tanks in aircraft industry. Welded aluminum sheets are used almost entirely. Tanks are built to conform to shape of the fuselage, and are honeycombed with baffle plates to prevent sudden shifting of contents.—Page 213.

* * *

Pearlitic cast iron is replacing cast steel and cast iron in British engine building, if recent exhibit may be taken as criterion. Fire bars of the improved iron are still sound after 16 months service. Ordinary gray iron castings last only 3 months.—Page 220.

* * *

Apprentice - training not an added expense if quota of apprentices is correct. Work of apprentices is usually done well enough to carry labor cost and all indirect charges.—Page 204.

* * *

Lifting button permits convenient handling of cupola coke-charging buckets. A cone-type button is fixed at upper end of a steel shaft through the center of bucket, which has a dump bottom.—Page 210.

Predicts closer attention to material costs in aircraft industry, as quantity-production methods are adopted. Investigator believes this will encourage even greater use of alloy steels for aircraft parts.—Page 214.

* * *

Charge storage space for patterns not in use for six months. Two gray iron foundry associations have adopted this rule. Steel foundries destroy patterns for which no orders have been received within two years.—Page 215.

* * *

Coal dust for sand mold facing should be "superfine" quality, of not less than 30 per cent volatile content. Coarse-graded coal dust functions improperly, because of uneven distribution among the sand grains.—Page 216.

* * *

Makers of small parts used in aircraft construction are showing a growing tendency to "trademark" the part and also to add a symbol denoting year of manufacture.—Page 214.

* * *

Increases cupola output 25 per cent by using hot blast. Automobile foundry cuts coke consumption 30 per cent and gives cupola linings longer life by abandoning cold blast.—Page 208.

* * *

Flash-welding dies lined with copper-tungsten alloy are in good condition after 600 welds. With die materials formerly used, dies are said to have required redressing after 50 welds.—Page 214.

THE IRON AGE

W. W. MACON
Managing Editor

ESTABLISHED 1855

Tariff Dust Clouds

ONE grows weary of reading the vehement exaggerations, published voluminously in recent weeks, telling what foreign Governments will do to the hurt of American trade if the present Congress raises existing duties. We are told with increasing insistence that our European debtors cannot pay us what they owe if we build up tariff walls so high that they cannot send us their products. The statement is so self-demonstrating—and so many Americans have been saying practically the same thing for so many years—that the reader wonders why so much strength is expended in reiterating it. Of about the same caliber would be the rejoinder that if American duties are made so low that foreign goods flood our markets industry here would be so depressed that Europe could no longer get loans from us wherewith to pay its debts.

No one really expects that the new tariff rates will be made so high that Europe cannot send us goods; and it is equally unlikely that they will be made so low that any domestic industry will have to put workers in idleness while low-priced products of its European competitors come in freely. In spite of all the thundering in the index, Europe, Canada, Argentina and the rest will do a great deal of buying from the United States after the new tariff bill is enacted, and the shipments of foreign products into this country will not be in materially smaller volume than in the years last past.

Whatever may have been said for partisan reasons in recent discussions at Washington, no one will seriously contend that the good will of foreign buyers—and sellers—is not to have weight in the making of our tariff schedules. President Hoover did well to remind Congress in his message last March that "in determining changes in our tariff we must not fail to take into account the broad interests of the country as a whole, such interests including our trade relations with other countries." At the same time he gave the right answer to foreign critics when he said that no discrimination against any foreign industry is involved in equalizing the difference in costs of production at home and abroad, "thus taking from foreign producers the advantages they derive from paying lower wages to labor."

We scarcely need say that it is the conversion of these generalizations into definite terms of ad valorem and specific duties that makes the trouble. But men who have sat on the Ways and Means Committee or the Senate Finance Committee learned long ago that predictions of domestic producers and those of importers as to the effect of a proposed rate on the volume of domestic or import business were far different from what actually happened when the identical rate took its place in the law. This, too, even when the rate in question had all the sanctions of so-called expert comparison of wage rates and other elements of foreign and domestic costs, for costs have far less to do with determining the destination of an order than tariff theory has ever taken into account.

Those whose tariff platform makes the welfare of the greatest number the criterion of all rate making will be glad to see the Senate bill drafted on the basis of recognizing any economic changes, since the present tariff was enacted, that have put domestic producers at a disadvantage. What is in order is not such a wide range of rate increases as the House bill provides, but, in accordance with promises made in the campaign of 1928, such reasonable amendment of the act of 1922 as is called for in the light of seven years' experience under it.

Paying for What One Gets

A CARDINAL principle of buying, as exemplified by the practice of Uncle Sam, is to accept the lowest bid that will meet the specifications. Other things being equal, this is a very good rule, and many people outside governmental circles practice the same method. Unfortunately, "other things" usually are not equal. This has been brought out forcibly in an article by Morton C. Tuttle, Boston builder, in the Boston *Evening Transcript*. While his comments related to building construction, their application is far wider.

Mr. Tuttle spoke particularly of low bids based on a series of cut-throat prices obtainable from certain sub-contractors. He pointed out that most often, when such bids are accepted, the orderly and timely progress of building is interrupted by delays caused by "sub-contractors of all degrees of ineptitude, * * * hard at work making confusion, delay and waste." And as "the progress schedule for a modern construction job is a complicated time-table fixing the arrival and departure of the different trades," a loss of time in one element throws the whole schedule out of gear, and no one profits.

Particularly troublesome are the results of such delay when the high costs of modern city building are involved, with heavy interest accruals. Or when the structure is urgently needed at a particular time, and prospective business is lost if it be not ready.

If modern automobile works were subjected to such conditions the cars would cost the public far more than they do. A plant building cars without a

stockroom, depending upon regular, prompt, uninterrupted supply of the parts, including sub-assemblies; another one running on a basis of a 5-hour storage of the necessary parts, and more goods constantly in transit to take the place of what is used from hour to hour—these schedules could not exist without the utmost reliability of their suppliers, all along the line.

A low price may be an adequate price for what one gets in exchange for it. But if what one wants or needs is beyond the scope of the low bidder, the price is low in seeming only, and a higher one might better be paid.

Automobile Exports Not So Large

WHEN very heavy automobile production was predicted for the present year it was explained that, while the domestic market might have difficulty in absorbing a large increase, there was room for a very considerable expansion in exports. Observing the remarkably heavy production reported month by month this year one might assume that the prediction was being fulfilled. As a matter of fact, however, exports have increased less than the domestic trade. Comparing the first five months of last year and this, there was an increase of 48 per cent in the number of cars and trucks produced, while the number exported increased only 33 per cent. The remainder, left for the domestic trade, represents an increase of 51 per cent.

The matter is somewhat complicated because in common thought we have two different conceptions of automobile activity, one derived from the monthly statistics of car and truck production, the other from the purchases of materials by the industry. These purchases provide for the manufacture of exported parts. For the domestic trade parts need hardly be considered, for we have the statistics of production, and there are only replacement parts in addition. For the export trade we have in addition to exported units the exports of parts for foreign assembly, and there may be an important increase there when none is shown in the complete units exported. Therefore we compile a brief statement to cover substantially the whole ground, considering cars and trucks first and then exported parts.

Cars and Trucks

	Produced in U. S.	Exported	Export Per Cent
1925	4,265,830	303,059	7.1
1926	4,300,934	305,528	7.1
1927	3,401,326	384,309	11.3
1928	4,358,759	507,253	11.6
1929*	2,677,781	273,499	10.2

*Five months only.

The jump in percentage from 1926 to 1927 is to be noted; but in 1928 there was only a negligible increase, while thus far this year exports have not increased as much as production. Since it might be suggested that there is a difference in domestic and export seasons it may be mentioned that in the first five months of last year the export proportion was 11.4 per cent, substantially typical of the whole year.

Next we have exported parts, which are reported separately as engines, parts for foreign assembly, and parts for replacement. The table below gives the total of the three, and to convey an idea of the importance of the parts the value of cars and trucks exported is given:

Automobile Exports, Value

	Cars and Trucks	Parts
1925	$222,784,738	$86,990,232
1926	223,763,952	87,135,601
1927	278,297,096	102,357,758
1928	355,112,806	135,780,267
1929*	179,759,581	103,466,688

*Five months.

For four years parts held just even with complete units exported, at 37 to 39 per cent, while this year the proportion jumped to 58 per cent.

Admittedly the export trade of the automobile industry, in units and parts, is very important, but it is far from large enough to take the edge off a large decline in the domestic demand should one occur, and the domestic demand of the last 12 months has been phenomenal by comparison with its slow growth in immediately preceding years.

Protecting Inventions Abroad

JAMES L. BROWN, chief of the patent and trademark section of the Bureau of Foreign and Domestic Commerce, writing in *Commerce Reports*, urges upon American exporters a greater interest in protecting their inventions by patents in foreign countries. Mr. Brown sees that too little attention has been paid to the subject and as a consequence there has been loss of trade to foreign competitors. He would have the machinery manufacturer take out patents in Great Britain, Germany, France, Canada and every other country where the particular type of machinery is built, and also in every country where it is used or where there is indication of a future demand. American manufacturers agree to this in principle, but they know that much money has been wasted on useless patents abroad and are more discriminating than they used to be.

The attitude of inventors and makers of patentable articles in the period since the war has been a changing one. In the stress of war production European manufacturers overcame much of their prejudice against American industrial methods and equipment. After the Armistice there was a feeling in the United States that this change of mind marked the beginning of a new era in European industry, which should mean a huge demand for much of our equipment that had come to be indispensable here. Consequently there was something of a rush to secure patent protection abroad on the many inventions of war time. But in the great unsettlement of reaction the anticipated quick market failed to materialize. Capital was not at hand to assist; enthusiasm waned here, and some apathy developed regarding foreign patents.

There has been, of course, no neglect to patent abroad the important inventions in the newer fields, as the radio, airplane, electrical, motion picture and automobile. In addition, in the last year or two, according to patent attorneys, there has been a general renewal of patent activities, due to the growing importance of foreign markets for American manu-

factured products. But those interested are proceeding with discrimination. To cover by patent large geographical areas is costly, not only in the initial stages, but in the annual or biennial fees which must be paid in nearly all countries, under penalty of automatic cancellation.

The situation in Germany is probably the most difficult. To secure protection there an invention must be more than an improvement or refinement. It must approach closely to the basic, for it must involve, to quote the law, a new "technological effect." Therefore, many inventions, patentable here and in most other countries, cannot get by in Germany. It often happens that, as Germany is coming to be our most formidable competitor in fields where new inventions play a large part, the American manufacturer feels that if a German patent is not procurable it is not worth while to seek protection in other countries.

There is abundant evidence, according to patent authorities, of the wisdom of careful study before deciding to seek patent protection abroad. The fact is that a large percentage of such patents on American inventions have been permitted to lapse after a year or two for non-payment of fees. Yet foreigners seem not to have taken advantage of such removal of protection. Nor has failure to work American inventions abroad, under the compulsory working clauses existing in all countries except the United States, developed many instances of competitors making use of the inventions. If an invention is not worth protecting by payment of fees or by working, either by the owner or under royalty, it is fair to presume in most cases that it was never worth the trouble and cost of patenting.

Coke By-Products Do Well

COKE by-product values have increased slightly in the last three years, belying fears entertained long ago that the general saving of by-products would so flood the market as to bring about unremunerative prices. The by-products are many and prices have moved variously, but the general trend has been as stated. The Bureau of Mines has put out a compilation showing for various years the total value of coke by-products, whether sold or consumed by the producer, per ton of coke made. The figures are given below, and as commodity prices generally have fluctuated we add the Bureau of Labor's index number of all commodity prices at wholesale, with a computation dividing the by-products value by the index number. This in essence is reducing the value to terms of the 1926 dollar, 1926 being the base year of the commodity index:

Value of Coke By-Products Per Ton of Coke Made

	Actual Value	Commodity Index	Converted Value
1915	$2.19	69.5	$3.15
1917	3.01	117.5	2.56
1922	3.32	96.7	3.44
1923	3.48	100.6	3.46
1924	3.51	98.1	3.58
1925	3.58	103.5	3.45
1926	3.52	100.0	3.52
1927	3.66	95.4	3.84
1928	3.66	96.7	3.78

Apart from the upward trend of values, both absolute and relative to commodity prices in general, the coke producers have had the advantage of lower coal prices in the last few years. Coal as charged into ovens last year had an average value of $3.57, against $3.87 for 1927 and $3.88 for 1926. As these values include widely varying freights paid they are no indication of the f.o.b. mine price.

The realization involved in the table of values includes breeze. Excluding breeze, the sales of by-products, to affiliated departments and to outsiders, totaled $151,309,528, and that was three-fifths of the delivered value of the coal used. Half the total was realized on gas, $76,498,857; the next largest item was ammonia, in sulphate and liquor form, $27,340,056; then followed in order tar, $17,544,797, and motor benzol, $16,832,646.

Since 1919 there has been rather a slow growth in the number of by-product ovens—from 10,379 on Jan. 1, 1920, to 12,544 at the beginning of this year. But more ovens than thus indicated have been built, as not a few have been dismantled. There has been a sharp increase in the production from 30,833,951 net tons in 1920 to 48,313,025 net tons in 1928, chiefly by reason of beehive coke being displaced. At the present time, however, by-product construction is quite active.

CORRESPONDENCE

Appeals for Invaluable Apparatus for Museum

To the Editor: The Rosenwald Industrial Museum of Chicago is the result of an endowment of $3,000,000 made by Julius Rosenwald, for the equipment and maintenance of the institution, and a $5,000,000 bond issue voted by the people of the city to the South Park Commissioners for the restoration of the old Fine Arts Building in Jackson Park, which will permanently house the technical collections.

In this museum the history of science, engineering and industry will be interpreted, not only by three-dimensional working models, but (and this is something that has not been attempted anywhere) also so presented that the social and economic causes and results, the little known background of all of the epoch-making inventions and discoveries, will be clarified.

We have recently learned that a Newcomen engine stood for many years on the shores of Newark Bay and was finally junked because no institution would give it a permanent home. The big Corliss beam engine that ran the Pullman Works met a similar fate. It is quite conceivable that there are still in existence many of these technical relics, in some inconspicuous corner.

We should like to appeal to your readers who may know of the location of some invaluable pieces of apparatus which might well find a home in the first industrial museum in America. If so, their communications, addressed to the director of the Rosenwald Industrial Museum, 300 West Adams Street, Chicago, will be most welcome.

JOHN A. MALONEY,
Assistant to the director,
Rosenwald Industrial Museum.

Chicago.

New Card of Extras Issued

Manufacturers of Cold-Finished Steel Bars and Shafting Announce Price Revisions

MANUFACTURERS of cold-finished steel bars and shafting issued a card of extras on July 15 which supersedes the previous card, dated Oct. 17, 1927. Hereafter this will be known as the "card of extras" instead of the "standard classification of extras" and it will be included in the "Manufacturers' Standard Practices."

Features of the new card of extras are briefly summarized in the following paragraphs:

There are no changes in the size extras on rounds, squares, hexagons and flats.

Extras for odd and intermediate sizes.—There are no changes except that the "odd size" extra applies on specifications for less than 20,000 lb. of one size and grade for shipment at one time.

Extras for turned and polished steels.—These have been increased and in some instances, especially on smaller sizes, advances are substantial. Extras shown under date of Oct. 17, 1927, and preceding cards were entirely too low and manufacturers have been handling this character of business at a loss. The new extras will permit the manufacture of this character of material at a reasonable profit.

Extras for chamfering.—No changes.

Boxing and burlapping.—The only change is the omission of the "burlapping extra of 15c. per 100 lb." While railroads require shippers to burlap (both ends and middle), all less-than-carload shipments weighing less than 24,000 lb., manufacturers recognize the increased tonnage handled by electric traction lines, steamship companies and motor truck haulage, and on these movements burlapping, required by railroads, is not necessary.

Extras for special composition.—It will be observed that this is set up in a different way. Extras A, B, C, D, G, H, I, J and K are the same as in the previous card, though some of these—B, C, D, I, J and K—were not published. The principal changes, in E and F, represent a reduction.

Extras for special finish.—This displaces the extras in the Oct. 17, 1927, card applying on "piston rod steel." The new extras are the same as the old on sizes 1⅛ in. and larger, while on the smaller sizes they are higher. This is because most of the product is now made by the cold drawing, grinding and polishing process, the cost of which is represented by the new extras. Heretofore manufacturers have used a special list (unpublished) to cover cold drawn, ground and highly polished bars and the new extras on sizes smaller than 1⅛ in. are substantially the same as the unpublished list.

Extras for long and short lengths.—It will be noted that the extras for lengths shorter than 84 in. have been increased slightly and that some new brackets have been added. Extras for lengths 84 in. to 119⅛ in. are unchanged, as are the extras for lengths longer than 24 ft. Two new paragraphs have been added. These are explanatory.

Quantity differentials.—The extra for lots (one size and grade for shipment at one time) less than 500 lb. has been increased from $1 to $1.50, while the extra for lots—500 lb. to 999 lb. has been increased from 75c. to 90c. per 100 lb. The new extras represent the actual cost of handling these small quantities. Prior to this, manufacturers have not been fairly compensated for the heavy cost of getting out these small lots, which the jobber is so much better equipped to handle. No changes have been made on lots 1000 lb. to 1999 lb., or on lots 2000 lb. to 3999 lb.

Extras for accuracy.—These have been revised completely. In most instances, the new extras are lower than those shown in the previous card, and it will be observed that the headings are different. In other words, the extras for oversize accuracy have been omitted, as it is the manufacturer's practice to work from a given size to a specified tolerance undersize. The revision of these extras clarifies a condition which in previous cards was sometimes misunderstood.

Standard manufacturing tolerances.—These are unchanged.

The new card of extras is to become effective at once. However, as most buyers are under contract for the third quarter, it will not become effective in such cases until Oct. 1, the beginning of the next contract period. Buyers under contract for the third quarter will be given the benefit of the new "extras for chemical composition," as all changes here represent a reduction.

Committee Will Advise On Census of Manufactures

WASHINGTON, July 23.—George G. Crawford, president, Tennessee Coal, Iron & Railroad Co., Birmingham, Walter S. Tower, Bethlehem Steel Co., Bethlehem, L. S. Horner, president, Niles-Bement-Pond Co., New York, and Clarence M. Wooley, president, American Radiator Co., New York, are among a list of 18 members of an advisory committee on census of manufactures invited by Secretary of Commerce R. P. Lamont to assist in planning for the 1930 census of manutures, which is intimately associated with the coming fifteenth decennial census. The committee will meet at the Department of Commerce here on Thursday of the present week for the primary purpose of discussing coordination of statistics covering the nation's manufacturing output with the census of distribution data to be collected next year for the first time.

The advisory committee is made up of manufacturers, economists, statisticians and others. This is the third census advisory committee which has been formed, the other two, the advisory committee for the census of unemployment and the advisory committee for the census of distribution, having held sessions in the department last week. It is planned to organize a fourth advisory committee in connection with the census of population.

In a general sense, according to Secretary Lamont, discussion at Thursday's conference will include the scope of the manufactures census schedules, the establishment of a line of demarcation between the manufactures census and the census of distribution, and determination of additional inquiries, if any, which it might be desirable to include to throw more light upon the distribution enumeration, which represents a new government undertaking.

According to officials of the Census Bureau manufacturing activities are classified, for census purposes, into 340 separate industries, of which 114 are canvassed by means of a general schedule and 226 by special schedules. The combined number of inquiries on all the manufactures schedules used at the census of 1927 amounted to nearly 15,000. It is believed to be highly essential to consider special schedules, industry by industry, and that recommendations regarding a particular schedule should be solicited only from the industry or industries concerned.

The suggestion has been advanced that the question whether the rather detailed inquiry with regard to the numbers and horsepower of the several classes of prime movers (steam engines, steam turbines, hydro-turbines, etc.) in use in manufacturing establishments shall be carried on the schedules at every biennial census of manufactures or shall be carried only at alternate censuses. This subject and that regarding quantities of coal consumed are among the many topics which the committee probably will discuss.

Secretary Lamont Appoints Unemployment Committee

WASHINGTON, July 23.—Complying with a resolution adopted at the recent meeting of the advisory committee for the unemployment census that a small executive committee be named to cooperate with the Department of Commerce in drawing up an appropriate questionnaire and in making plans for the unemployment enumeration, Secretary of Commerce R. P. Lamont has extended invitations to the following persons to become members of the committee:

Dr. Joseph H. Willetts, University of Pennsylvania, Philadelphia; William Green, president, American Federation of Labor, Washington; J. Chester Brown, chief statistician, Bureau of Labor Statistics, Department of Labor, Washington; William A. Berridge, Metropolitan Life Insurance Co., New York; George E. Roberts, vice-president, National City Bank, New York; L. W. Wallace, American Federated Engineering Societies, Washington; Dr. E. Dana Durand, chief, statistical research division, Bureau of Foreign and Domestic Commerce, Washington.

The Rudel-Ryder Machinery Co., Ltd., 159 Bay Street, Toronto, Ont., has been appointed exclusive selling agent for the products of the Geometric Tool Co., New Haven, Conn.

Iron and Steel Markets

No Marked Recession in Sight

Steel Production Well Maintained Although Operations Are Tapering at Pittsburgh—Southern Pig Iron Sellers More Aggressive

SIGNS of a letup in the activity of the iron and steel industry are not lacking, but there is no indication of a recession of customary summer proportions. A further decline has occurred in the consumption of automobile steels, which is now 25 to 35 per cent below the peak rate of May, and the aggressive selling of Alabama pig iron is being felt in a wider area, but steel ingot output as a whole shows little change and foundry melt in the North and East is well maintained.

While steel production in the Pittsburgh district is reported as tapering, operations are holding up in other centers and nothing resembling an appreciable reduction is in sight. Steel Corporation subsidiaries continue to produce at a capacity rate.

The buoyancy of the scrap market, particularly in open-hearth grades, is also an earnest of sustained steel output. Heavy melting grade at Pittsburgh has advanced 25c. a ton to $18.75.

In the pig iron market the broadening scope of Southern competition reflects a decline in Birmingham consumption and a corresponding need for business from other markets. The Alabama subsidiary of the Steel Corporation is shipping against orders for 50,000 tons each from a New Jersey cast iron pipe plant and a Pacific Coast steel works, and has booked 12,000 tons for delivery in Japan.

In eastern Pennsylvania a large consumer has bought a trial tonnage of Southern basic at $19.50, delivered, or 50c. a ton below the price at furnace in that district. In Chicago, Alabama foundry iron is freely offered at $14, Birmingham, and in some instances at $13.50.

The decline in steel specifications from the automobile industry is regarded as temporary, being attributed chiefly to the changing models, and a recovery in releases is expected in about 30 days.

Demand from other consuming lines is active. Pipe lines, which have become a major outlet for steel, have added large tonnages to mill books during the week. The Milwaukee maker of electrically welded pipe will supply 191,000 tons for the longest gas line ever laid, to be built for the Central States Natural Gas Co. from Amarillo, Tex., to Chicago, a distance of 950 miles. The Republic Iron & Steel Co., which recently undertook the making of electric-welded pipe, has taken an order for 200 miles of 6-in. (8000 tons) for the Southwestern Gas Co. A pipe line for Vancouver, B. C., calling for 5000 tons of plates, has been placed with a local fabricator.

Structural steel demand continues at high tide. Computed orders for June, as reported by the Department of Commerce, were 354,200 tons, a total exceeded only once—in March, this year, when returns showed bookings of 358,000 tons. Orders for the first half, at 1,936,500 tons, showed a gain of 23 per cent over the corresponding period in 1928. Awards for the week, at 38,000 tons, were of average proportions, while new inquiries, totaling 34,000 tons, included 13,200 tons for a New York subway section.

Canadian structural work in early prospect is estimated at 100,000 tons, one-half of the total being for the provinces of Ontario and Quebec.

Railroad buying is featured by rail orders of 15,000 tons each, placed by the Pennsylvania and the Northern Pacific. The Nova Scotia mill has been awarded 11,000 tons by the Newfoundland Government. The Wabash has bought 25 large freight locomotives and the Texas & Pacific is in the market for 15. Several large car inquiries are expected from Western roads, among them the Santa Fe, the Union Pacific and the Illinois Central.

Plates, influenced to a large extent by requirements for pipe, are in heavy demand at Chicago, where they accounted for 20 per cent of the mill bookings of the week. This product is also active in other districts. Eastern mills welcome the delay in Governmental approval of contracts for merchant ships and cruisers, preferring to receive the steel specifications when the present pressure for plates has been relieved.

Steels used by the automotive industry are growing easier in price. In sheets the need for new business is becoming more of a factor in the common finishes and the heavier gages. On black sheets 2.85c., Pittsburgh, has become general, 2.95c. having virtually disappeared even as an asking price. Galvanized sheets are being sold rather commonly at 3.60c., Pittsburgh, to consumers and at 3.50c. to jobbers. Sales of heavy gage blue annealed have been made at 2.10c., for No. 10 gage, and in special instances at 2c. Tin mill black plate has been sold at 2.90c., Pittsburgh, a decline of $2 a ton from the recent ruling level.

Sales of steel sheets in the first half of the year, as reported by the independent manufacturers, averaged 380,000 tons a month, or 25 per cent above the average of the corresponding period in 1928. Shipments amounted to 362,000 tons a month, 14½ per cent better than last year. Production kept pace with shipments, averaging 365,000 tons a month.

Both of THE IRON AGE composite prices are unchanged, pig iron at $18.42 a gross ton and steel at 2.412c. a lb.

A Comparison of Prices

Market Prices at Date, and One Week, One Month and One Year Previous, Advances Over Past Week in Heavy Type, Declines in Italics

On export business there are frequent variations from the above prices. Also, in domestic business, there is at times a range of prices on various products, as shown in our market reports on other pages.

Pittsburgh

Less Tension in Production—Sheet Still Behind in Deliveries but Prices Are Weak

PITTSBURGH, July 23.—Two or three companies in this district have taken out open-hearth furnaces in the last week. Although the need for repairs is held responsible for this curtailment in one of the cases, steel production in the Pittsburgh district is beginning to taper. The larger companies, in the face of declining specifications in many products, are no longer pushing their steel capacity to the limit. The condition is reflected in slightly lighter shipments of ferroalloys and furnace coke, as well as in a generally easier condition in the semi-finished steel market, the supply of this commodity now being fully equal to the requirements of all the large companies.

The present month is expected to show a slight decline in shipments of nearly all products, probable exceptions being wire and plates. Had it not been for the hot weather early in the month, sheet production would likely have been equal to June, as sheet mills are still behind in deliveries and have enough business on their books for four to six weeks operations.

Backlogs on bars and shapes have declined materially and strip steel and cold-finished steel bars are now being moved in the two or three weeks usually required for rolling.

Makers of lapweld pipe in the larger sizes are preparing to quote on several large projects, and with present operations at a fairly high rate, the second half of the year is expected to prove more profitable than the first.

Sheet prices have shown additional weakness and the maximum quotations of 2.85c. and 3.70c., Pittsburgh, on black and galvanized sheets, respectively, are no longer applying on any important tonnage. The general market has settled to prices $2 under the above figures with galvanized sheets now being commonly sold to jobbers at 3.50c. On blue annealed light plates, the product of continuous strip mills are being sold at 2.10c and even less, although makers of blue annealed sheets operating jobbing mills are holding to 2.20c. Tin mill black plate has been sold by several producers for 2.90c., Pittsburgh, a concession of $2 a ton from recent levels. The higher asking price on cold-rolled strip steel is no longer effective and one or two cases of shading the 2.75c. quotation are reported.

The pig iron and coke markets are quiet. A steel company in this district is reported to have bought a substantial tonnage of basic iron in the last week, but the price was not disclosed. Other sales are of small tonnage, but the aggregate is fairly satisfactory. The scrap market is stronger and No. 1 heavy melting steel is now quotable at $18.50 to $19.

Pig Iron.—Activity is still confined largely to small fill-in orders, although one large sale of basic pig iron to a non-integrated steel company in this district is reported. The Westinghouse Electric & Mfg. Co. has placed the second-half requirements of its Trafford City plant with at least three

producers. The price on the foundry grade was $20.01 delivered. This figures back to $19, Pittsburgh local furnace, and represents a slight concession made by the Valley makers who shared in the business. However, the Valley prices of $18.50 for foundry and basic iron, and $19 for malleable and Bessemer are being strictly adhered to in small sales in the immediate Valley district and other points at which the Pittsburgh furnace does not have a freight rate advantage. Shipments against contracts are steady but not of large proportions. A number of consumers are said to have placed small tonnages recently to tide them over the summer months, as they have sufficient iron on previous contracts to keep them from going into the market at this time for any considerable tonnage. The Standard Sanitary Mfg. Co. has issued one or two small inquiries for supplementary tonnages at its Pittsburgh district plants, and may not enter the market for any substantial tonnage at this time. This method of buying in small lots has probably added strength to the market, as furnaces are not inclined to accept lower prices except to build up substantial backlogs. Furnace stocks are not accumulating and many makers are not now prepared to quote on large tonnages for delivery in the immediate future. The Claire furnace of the Davison Coke & Iron Co. was blown out on July 23 for relining and the same company's Cherry Valley stack is expected to go in during the first week of August.

Prices per gross ton, f.o.b. Valley furnace:

Basic	$18.50
Bessemer	19.00
Gray forge	18.00
No. 2 foundry	18.50
No. 3 foundry	18.00
Malleable	19.00
Low phos., copper free	27.00

Freight rate to Pittsburgh or Cleveland district, $1.76.

Prices per gross ton, f.o.b. Pittsburgh district furnace:

Basic	$19.00
No. 2 foundry	19.00
No. 3 foundry	18.50
Malleable	19.50

Freight rates to points in Pittsburgh district range from 63c. to $1.13.

Semi-Finished Steel.—The supply of crude steel in this and nearby districts is now of about normal proportions, although open-hearth production must be maintained at a very high rate to maintain this situation. Two or three companies in the district have put out furnaces in the last week, but not because stocks are accumulating. Integrated steel makers who normally have a small surplus of semi-finished steel for sale in the open market have nothing to offer at this time. Several large buyers of billets and slabs have not yet contracted for their third quarter requirements and the price situation is unchanged, with producers holding to $35, Pittsburgh or Youngstown, and buyers refusing to pay more than $34. On sheet bars the price is well established at $35, with a few companies asking $36 on spot tonnage. Very little business has been taken at the latter figure. Wire rods are steady at $42, Pittsburgh or Cleveland, and shipments against contracts are high for this time of the year.

Bars, Shapes and Plates.—Tonnage releases are still ahead of expectations, but some makers report a slight decline as compared with the previous month. Mills are having considerable difficulty satisfying customers on plate shipments, although the situation has eased off slightly in the last month. It is still difficult to get deliveries in less than six weeks and one large maker has enough business booked to assure capacity operation for at least two months. Demand from barge builders and railroad equipment makers is responsible to a large extent for this situation, but there is a satisfactory movement into other consuming channels. Bars are moving well, with delivery promises averaging from three to four weeks. Reinforcing steel is accounting for a large tonnage and there is a steady demand from screw machine product makers and cold-finishing mills. Agricultural implement makers served by Pittsburgh companies have not curtailed their steel requirements. Shapes are the least active of the heavy hot-rolled products. However, the larger fabricating shops in the district are well occupied and the volume of pending business is satisfactory for this time of the year. Plates are holding firmly at 1.95c., Pittsburgh, while there are occasional concessions of $1 a ton on shapes and bars.

Wire Products.—Demand for manufacturers' wire is fully equal to that of June, but shipments of fencing, barbed wire and other products going to the farms have fallen off slightly. In the aggregate the wire business is considerably ahead of last year and prospects are encouraging. The nail market is characteristically quiet, and continued price weakness is reported in outlying territory, where quoting on a mill base is more common than naming a Pittsburgh base. Pittsburgh mills are meeting this competition in some instances, but have not had to go below 2.65c. per lb., Pittsburgh, in territory east of here. The 2.75c. price also applies on a limited amount of business. On wire no deviations from 2.50c. to 2.60c., Pittsburgh or Cleveland, are reported.

Tubular Goods.—Mills in the Pittsburgh and Youngstown districts are very optimistic over the prospective line pipe business and are prepared to quote on several of the large projects now being considered. Lap-weld and seamless mills are operating at about 60 per cent on an average, although this figure is based on considerable capacity that will probably not be utilized again in the manufacture of pipe. Demand for standard pipe is steady, but not active, while shipments of mechanical and boiler tubing are holding up well.

Sheets.—Shipments of sheets during July will probably show a slight decline as compared with June, but they may be close to record proportions for this month. Some curtailment in production in July has been occasioned by the hot weather, but this was not a factor during the last week and the leading interest operated its mills at about 98 per cent of capacity. The greater part of the falling off in demand may be traced to curtailment in the operations of makers of medium-priced automobiles, as demand from other consuming industries has not declined appreciably. Makers of electrical refrigerators are still requiring large tonnages of sheets and the radio industry is growing in importance as a user. Prices are not

Alloy Steel Bars

(F.o.b. makers' mill)

Alloy Quality Bar Base, 2.65c. to 2.75c. per Lb.

S.A.E. Series Numbers		Alloy Differential
2000	(½% Nickel)	0.25
2100	(1½% Nickel)	0.55
2300	(3½% Nickel)	1.50
2500	(5% Nickel)	2.25
3100	Nickel Chromium	0.55
3200	Nickel Chromium	1.35
3300	Nickel Chromium	3.80
3400	Nickel Chromium	3.20
4100	Chromium Molybdenum (0.15 to 0.25 Molybdenum)	0.50
4100	Chromium Molybdenum (0.25 to 0.40 Molybdenum)	0.70
4600	Nickel Molybdenum (0.20 to 0.30 Molybdenum, 1.25 to 1.75 Nickel)	1.05
5100	Chromium Steel (0.60 to 0.90 Chromium)	0.35
5100	Chromium Steel (0.80 to 1.10 Chromium)	0.45
5100	Chromium Spring Steel	0.20
6100	Chromium Vanadium Bars	1.20
6100	Chromium Vanadium Spring Steel	0.95
9250	Silicon Manganese Spring Steel (flats)	0.25
	Rounds and squares	0.50
	Chromium Nickel Vanadium	1.50
	Carbon Vanadium	0.95

Above prices are for hot rolled steel bars, forging quality. The ordinary differential for cold-drawn bars is ¾c. per lb. higher. For billets 4 x 4 to 10 x 10 in., the price for a gross ton is the net price for bars of the same analysis.

Billets under 4 x 4 in. carry the steel bar base. Slabs with a sectional area of 16 in. or over carry the billet price. Slabs with sectional area of less than 16 in. or less than 2½ in. thick, regardless of sectional area, take the bar price.

Rails

	Per Gross Ton
Standard, f.o.b. mill	$43.00
Light (from billets), f.o.b. mill	36.00
Light (from rail steel), f.o.b. mill	34.00
Light (from billets), f.o.b. Ch'go mill	36.00

Track Equipment

	Base per 100 Lb.
Spikes, ⅜ in. and larger	$2.80
Spikes, ½ in. and smaller	2.80
Spikes, boat and barge	3.00
Tie plate, steel	2.15
Angle bars	$2.75
Track bolts, to steam railroads	$3.80 to 4.00
Track bolts, to jobbers, all sizes, per 100 count	70 per cent off list

Welded Pipe

Base Discounts, f.o.b. Pittsburgh District and Lorain, Ohio, Mills

Butt Weld

Steel Inches	Black	Galv.	*Iron* Inches	Black	Galv.
⅛	45	19½	¼ and ⅜	+11	+36
¼ to ¾	51	25½	½	23	5
½	56	42½	¾	28	11
¾	60	48½	1 and 1¼	31	15
1 to 3	62	50½	1½ and 2	35	18

Lap Weld

2	55	43½	2	23	9
2½ to 6	59	47½	2½ to 3½	28	13
7 and 8	56	43½	4 to 6	30	17
9 and 10	54	42½	7 and 8	29	16
11 and 12	53	40½	9 to 12	26	11

Butt Weld, extra strong, plain ends

⅛	41	24½	¼ and ⅜	+13	+48
¼ to ¾	47	30½	½	23	7
½	53	42½	¾	28	12
¾	58	47½	1 to 2	34	18
1 to 1½	60	49½			
2 to 3	61	50½			

Lap Weld, extra strong, plain ends

2	53	42½	½	29	13
2½ to 4	57	46½	2½ to 4	34	20
4½ to 6	56	45½	4½ to 6	33	19
7 to 8	52	39½	7 and 8	31	17
9 and 10	45	32½	9 to 12	21	8
11 and 12	44	31½			

On carloads the above discounts on steel pipe are increased on block by one point, with supplementary discount of 5%, and on galvanized by 1½ points, with supplementary discount of 5%. On iron pipe, both black and galvanized, the above discounts are increased to jobbers by one point with supplementary discounts of 5 and 2½%.

Note.—Chicago district mills have a base two points less than the above discounts. Chicago delivered base is 2½ points less. Freight is figured from Pittsburgh, Lorain, Ohio, and Chicago district mills, the billing being from the point producing the lowest price to destination.

Boiler Tubes

Base Discounts, f.o.b. Pittsburgh

Steel		*Charcoal Iron*	
2 in. and 2¼ in.	40	1½ in.	1
2½ in.—2¾ in.	48	1¾ in.	8
3 in.	54	2 in.—2¼ in.	13
3¼ in.—3¾ in.	56	2½ in.—2¾ in.	16
4 in.	59	3 in.	17
4½ in. to 6 in.	48	3¼ in. to 3½ in.	18
		4 in.	20
		4½ in.	21

On lots of a carload or more, the above base discounts are subject to a preferential of two fives on steel and of 10 per cent on charcoal iron tubes. Smaller quantities are subject to the following modifications from the base discounts:

Lap Welded Steel—Under 10,000 lb., 6 points under base and one five; 10,000 lb. to carload, 4 points under base and two fives. Charcoal Iron—Under 10,000 lb., 2 points under base; 10,000 lb. to carload, base and one five.

Standard Commercial Seamless Boiler Tubes

Cold Drawn

1 in.	63	3 in.	48
1¼ to 1½ in.	55	3¼ to 3½ in.	50
1¾ in.	39	4 in.	53
2 to 2¼ in.	34	4½, 5 and 6 in.	42
2½ to 2¾ in.	42		

Hot Rolled

2 and 2¼ in.	40	3¼ to 3½ in.	56
2½ and 2¾ in.	48	4 in.	59
3 in.	54	4½, 5 and 6 in.	48

Beyond the above base discounts a preferential discount of 5 per cent is allowed on carload lots. On less than carloads to 10,000 lb. base discounts are reduced 4 points with 5 per cent preferential; on less than 10,000 lb., base discounts are reduced 6 points, with no preferential. No extra for lengths up to and including 24 ft. Sizes smaller than 1 in. and lighter than standard gage take mechanical tube list and discounts. Intermediate sizes and gages not listed take price of next larger outside diameter and heavier gage.

Seamless Mechanical Tubing

	Per Cent Off List
Carbon, 0.10% to 0.30%, base (carloads)	55
Carbon, 0.30% to 0.40%, base	50

Plus differentials for lengths over 18 ft. and for commercial exact lengths. Warehouse discounts on small lots are less than the above.

what they should be, considering the heavy backlogs of most of the large producers. The 3.70c. and 2.95c., Pittsburgh, quotations on galvanized and black sheets respectively are now applying on scarcely any business and, although these figures are still quoted, the market has settled to 2.85c. on black sheets and 3.60c. on galvanized. Jobbers are having little difficulty in placing business at the $2 concession usually offered them on galvanized sheets. Automobile companies are said to be able to buy black sheets at 2.75c., base, but, as this business cannot be classified as one-pass material on which the price is usually based, it is not representative of the market. High differentials for pickling and other treatment enable manufacturers to secure an adequate profit on this business which they would not be able to get on the ordinary one-pass product. Large makers in this territory are holding firmly to the 2.20c. and 2.35c., Pittsburgh, quotations on light plates and blue annealed sheets and are making no effort to compete with wide strips, which are sold at lower prices. Weakness has developed on tin mill black plate, which is now quotable at 2.90c. to 3c., Pittsburgh.

Tin Plate. — Demand continues rather steady and specifications for September tonnages from the container manufacturers have been satisfactory. In some cases mills will begin rolling this tonnage some time next week, as present backlogs are not sufficient to maintain the present rate of operations for any length of time. Mills in the district are well over a 90 per cent rate in operations and will continue these schedules for several weeks unless current demand declines suddenly.

Strip Steel.—Some makers of strip steel report heavier tonnage releases thus far in July than were received during the corresponding June period, but demand is rather spotty for both the hot and cold-rolled material. Makers who depend for the bulk of their tonnage on the manufacturers of medium-priced automobiles have been forced to curtail operations somewhat since the first of the month, but a fairly well diversified demand continues from other miscellaneous users of strips. Deliveries are no longer extended for more than two or three weeks except in isolated cases where mill facilities are largely responsible. On hot-rolled strip, prices are well established at 2c., Pittsburgh, for 6-in. and narrower, and 1.90c. for the wider sizes. Concessions of $1 to $2 a ton from the 2.75c., Pittsburgh, price on cold-rolled strip have been reported, but, so far as can be determined, this shading has always occurred under conditions that could not be said to govern the market. Makers generally have refused to meet quotations below 2.75c., although the 2.85c. price, formerly quoted on small-lot business, is gradually disappearing.

Cold-Finished Steel Bars.—Revision of extras on cold-finished steel bars, the details of which will be found elsewhere in this issue, results in slight price reductions when applied to the list as a whole. The new prices will not apply on third quarter tonnage, which is largely covered by contract. July business is holding up to June levels, but operations are largely on a week-to-week basis. Improvement in demand from the automobile industry is expected in a short time, but present specifications do not reflect this tendency. The price of 2.30c., Pittsburgh, is being well maintained.

Bolts, Nuts and Rivets.—Operations have declined slightly from the high rate of the spring months, but the industry as a whole is still running at 60 to 65 per cent of theoretical capacity, an unusually high level for this time of the year. Demand is well diversified, with railroad car builders taking a large tonnage and jobbers steadily requiring shipments. Price conditions are encouraging, with bolts and nuts unchanged at 70 per cent off list and large rivets holding at $3.10 per 100 lb., Pittsburgh or Cleveland.

Coal and Coke.—The furnace coke market shows little change from the previous week, with demand rather quiet and production somewhat higher than the present requirements of the consuming industry. Prices are unchanged at $2.75 to $2.85 a net ton, Connellsville, although producers are asking slightly higher figures on future tonnage in expectation of a stronger demand. On the foundry grade, both shipments and new business are at a low point and the situation is reflected in price uncertainty on all except the premium brands of coke, which are firm at $4.85, ovens. Coal production is holding up fairly well for this time of the year, but no price recovery is expected before fall.

Old Material.—The scrap market has developed further strength in the last week, and No. 1 heavy melting steel is now quotable at $18.50 to $19, the average being an advance of 25c. Although heavy melting steel is offered at some points at $18.75, mills would have difficulty in purchasing any quantity of first quality steel at that figure. One mill in the district which accepts car sides as No. 1 steel paid $18 for a considerable tonnage, and as other consumers will not take car sides at less than $1 a ton under the No. 1 grade, this purchase also bears out the strength of the market. Hydraulic compressed sheets are theoretically stronger but no sales at higher than $18.50, which might justify an advance of 25c. a ton, have been reported. Blast furnace borings and turnings have been sold at $12.75 and $13, and grades of steel which ordinarily reflect the strength of the No. 1 heavy melting grade have gained strength along with it. Rejections are frequent at all points in the district, and the scarcity of high grade No. 1 steel is probably responsible for the general strength of the market. However, with the large consumers nearly all taking scrap in undiminished quantities, and at a rate considerably higher than is usual at this time of the year, a strong market situation is not unexpected. It is freely believed that any marked recession in steel operations would be reflected immediately in the scrap market. And uncertainty on this point has resulted in a cautious attitude on the part of both buyers and sellers of scrap.

Warehouse Prices, f.o.b. Pittsburgh

	Base per Lb.
Plates	3.00c.
Structural shapes	3.00c.

Upset set screws	80, 10 and 5
Milled studs	70

Chicago

Renewed Demand for Plates Beyond District's Capacity —Look for Revival of Railroad Buying

CHICAGO, July 23.—New demands for plates and semi-finished steel have helped to place sales at the average of the year or about double the volume of the previous seven days. Fully 20 per cent of new purchases were plates for the manufacture of pipe and a liberal tonnage is accounted for by raw steel needs.

Mild steel bars also figured prominently in the week's business, in which rail purchases were of little moment. Deliveries on plates, which had improved in recent weeks to a range of seven to eight weeks, now promise to extend again. Local plate mills find themselves in a position wherein they cannot, if they intend to take care of expected normal business from regular customers, assume added obligations for this commodity and as a result plate orders are once more flowing to the East.

Specifications for plates, shapes and bars average well with recent weeks and match shipments, which are at local mill capacity.

Inquiry from a wide circle of consumers is more active. Interest is growing in the prospect of a revival of equipment purchases by Western railroads. The trade has hopes that the Illinois Central will buy 500 cars for the Central of Georgia and also complete for itself the buying program which was left uncompleted last spring. The Sante Fe and the Union Pacific are mentioned as two other possibilities and then there is the inquiry of long standing by the Chicago & Northwestern.

It is definitely known now that the expansion program of the Illinois Steel Co. will include a structural mill for rolling the Carnegie beam section.

Pig Iron.—Silvery iron is off $1 a ton on the lower grades and as much as $2 a ton on some of the higher grades. The new quotations are not firm and offerings are not attracting wide attention among buyers. The Southern iron market remains mixed as to prices, though $14 a ton, Birmingham, remains an average. Some sales figure back to $13.50 a ton when differentials are included at 25c. instead of the usual 50c. Sales are in moderate volume including 250 tons, which is a duplication of an order placed last week by a melter in western Illinois. A cargo of Lake Erie iron has docked at Milwaukee. Although the bulk of this iron was sold prior to shipment, still odd tonnages are offered that are said to figure as low as $18.50 a ton at Milwaukee. The Northern iron market remains steady at $20 a ton. With five merchant stacks in blast shipments are in excess of production. In fact deliveries so far in July are running only a trifle behind the June rate. Releases by the automobile industry and manufacturers of farm equipment are heavier. The general feeling here is that such lessening as there is in the rate of melting is due more to the vacation period and hot weather than to a definite falling off of business.

Prices per gross ton at Chicago:

N'th'n No. 2 fdy., sil. 1.75 to 2.25	$20.00
N'th'n No. 1 fdy., sil. 2.25 to 2.75	20.50
Malleable, not over 2.25 sil.	20.00
High phosphorus	20.00
Lake Super. charcoal, sil. 1.50	27.04
So'th'n No. 2 fdy. (all rail)	$19.51 to 20.51
Low phos., sil. 1 to 2, copper free	29.50
Silvery, sil. 8 per cent	29.79
Bess. ferrosilicon, 14-15 per cent	46.29

Prices are delivered consumers' yards except on Northern foundry, high phosphorus and malleable, which are f.o.b. local furnace, not including an average switching charge of 61c. per gross ton.

Plates.—New sales of plates account for close to 20 per cent of total finished steel purchases for the week. Moreover, new orders for plates are fully equal to shipments, following several weeks of a quiet market after the completion of the bulk of third quarter contracting. While a part of the plate tonnage placed during the week is for building purposes, the bulk of it will go into the manufacture of steel pipe. Since the first of July there has been steady improvement in deliveries, but new business has checked this trend and promises now are not better than seven to eight weeks. Local mills were not willing to obligate themselves for the full tonnage sought, and again sizable orders for plates for delivery in this district have gone to mills east of Indiana. Interest in oil storage tanks centers in specifications against old orders and in inquiries which are enlarged this week by 3000 tons. Tank fabricating shops are busy and their outlook, as gaged by pending tank programs, is unusually favorable. Reports are persistent that Western railroads are planning new car building programs that will take definite shape early in the fall. The Santa Fe is mentioned as one possible purchaser and the trade expects the Chicago & North Western to revive its inquiry for 1000 to 2500 box cars. Western car shops are well engaged, with schedules now arranged into September. Specifications for car material, though smaller than a week ago, are still of fair size.

Warehouse Prices, f.o.b. Chicago

	Base per Lb.
Plates and structural shapes	3.10c.
Soft steel bars	3.00c.

Com. wire nails, base per keg	3.20
Cement c't'd nails, base per keg	3.20

Ferroalloys. — Shipments are in good volume. New buying is quiet, with prices generally steady. Spiegeleisen is quoted $31 to $34 a ton, furnace, with few takers.

Prices delivered Chicago: 80 per cent ferromanganese, $112.56; 50 per cent ferrosilicon, $83.50 to $88.50; spiegeleisen, 19 to 21 per cent, $40.76.

Structural Material.—This market is more impressive from the viewpoint of the pending list than of current awards. Bids have been opened on the Parker School, Chicago, which will require 2300 tons, and also on the 1800 tons for the Fine Arts Building, but the low tenders have not yet been definitely accepted. Contracts ranging up to 1000 tons each have been more numerous in recent weeks and small and medium-sized shops are no longer hard pressed for immediate work. Large shops, while comfortably booked for the present, would feel more secure if a few of the large pending jobs would move faster. Sales of structural material are in good volume against recent lettings. Specifications, at 6000 tons, are close to the weekly average so far this year. Deliveries show improvement, with promises now ranging from five to six weeks. Awards for the week total close to 3000 tons, of which 1100 tons is for the Burnham Avenue bridge and 850 tons for the West Town Bank Building, both in Chicago.

Mill prices on plain material, per lb.: 2.05c. base, Chicago.

Sheets. — Chicago district sheet mills, operating at about 85 per cent of capacity, are still held in check by supplies of raw steel, inasmuch as orders at hand would warrant a higher rate of output. New buying is steady, but for current needs, and prices, as a week ago, are steady locally on all grades with the exception of light-gage galvanized sheets. Deliveries on blue annealed sheets have been advanced to 12 weeks, while the galvanized and black finishes may be had in three to four weeks. Distribution by jobbers is large and their specifications against contracts are liberal.

Base prices per lb., deliv'd from mill in Chicago: No. 24 black sheets, 3.10c.; No. 24 galv., 3.85c.; No. 10 blue ann'l'd, 2.35c. Deliv'd prices at other Western points are equal to the freight from Gary, plus the mill prices, which are 5c. per 100 lb. lower than Chicago delivered prices.

Cast Iron Pipe.—This market is quiet, with few tonnages before the trade, and new developments do not indicate an early turn for the better. Carload orders are more numerous than a week ago, but the change is not significant as a market factor. The

Lynchburg Foundry Co. has been awarded 9600 ft. of 6-in. and 7800 ft. of 8-in. pipe by Royal Oak, Mich., and the McWane Cast Iron Pipe Co. has taken 9000 ft. of 4-in. and 3000 ft. of 6-in. pipe for Naponee, Neb. Aberdeen, S. D., will take bids on 9800 ft. of 12-in., 9700 ft. of 10-in. and 8700 ft. of 8-in. pipe. This municipality also has a supplementary list for about 8500 ft. of 8 to 12-in. pipe and fittings, on which bids may be taken at a later date.

Prices per net ton, del'd Chicago: Water pipe, 6-in. and over, $45.20 to $46.20; 4-in., $49.20 to $50.20; Class A and gas pipe, $3 extra.

Bars.—Sales of mild steel bars have expanded in recent weeks, as widely diversified users have sought additional tonnages. The average rate at which tonnages are being sent to mills in July is above that of June and well above July, 1928. Specifications are fully equal to shipments, which promise to expand around Aug. 1, when some users will need larger quantities. Prices are steady at 2.05c. a lb., Chicago. Slightly smaller specifications for alloy steel bars are leading producers to cut output two to three points this week. Deliveries are improving, but the change is not marked and promises range from three to four weeks. Spot buying is moderately active at current quotations. Small orders for iron bars at 2.05c. a lb., Chicago, are numerous from railroads and other users. The bulk of the immediate needs of car builders has been supplied, and backlogs are light. Local rail steel bar mills are fully engaged and incoming business is ample to support current output. Barn equipment manufacturers have well arranged schedules for several months to come and the bed industry, in contrast with a year ago at this time, is well engaged. Orders for fence posts are seasonably dull.

Bolts, Nuts and Rivets.—This market is quiet and prices are steady. Current specifications are on a level with the average in recent weeks.

Rails and Track Supplies.—Western mills have booked 3000 tons of standard-section rails. About 2000 tons was for the Pennsylvania, which is reported to have placed 13,000 tons with Eastern mills. The Northern Pacific, which the trade expects will take 15,000 tons, may make its needs known about Aug. 1. Orders for track fastenings total 2500 tons, of which 1500 tons was for iron tie plates for use by railroads in and near Chicago. Rail rolling schedules have been revised downward, the average now being close to 75 per cent of capacity.

Prices f.o.b. mill, per gross ton: Standard section open-hearth and Bess. rails, $43; light rails, rolled from billets, $36. *Per lb.:* Standard railroad spikes, 2.80c.; track bolts with square nuts, 3.80c.; steel tie plates, 2.15c.; angle bars, 2.75c.

Old Material.—Heavy-tonnage buyers of scrap iron and steel, evidently influenced by price fluctuations in previous summers, are holding out of this market except for small lots for immediate needs. Dealers, confident of the underlying strength of the market, are bending every effort to cover short positions. However, in at least one grade, namely, heavy melting steel, indications do not bear out ideas of strength. Shipments against orders from the Gary mills have now been completed and new orders have not been forthcoming from that source. In all probability this will mean that the tonnage formerly diverted to Gary will have to be prepared for other mills, which for some time past have been amply supplied. Hydraulic bundles are moving more freely to mills, though one buyer is still taking this grade in limited tonnages. Prices for short rails are stronger as supplies run short and brokers actively bid against offerings by the railroads. The St. Paul is offering a supplementary list of 1000 tons and the Nickel Plate has advertised 3000 tons.

Prices deliv'd Chicago district consumers:

Per Gross Ton

Basic Open-Hearth Grades:	
Heavy melting steel	$14.75 to $15.25
Shoveling steel	14.75 to 15.25
Frogs, switches and guards, cut apart, and misc. rails	16.50 to 17.00
Hydraul. compressed sheets	13.00 to 13.50
Drop forge flashings	10.50 to 11.00
No. 1 busheling	13.00 to 13.50
Forg'd cast and r'l'd steel carwheels	18.25 to 18.75
Railroad tires, charg. box size	18.50 to 19.00
Railroad leaf springs cut apart	18.50 to 19.00
Acid Open-Hearth Grades:	
Steel couplers and knuckles	16.75 to 17.25
Coil springs	19.00 to 19.50
Electric Furnace Grades:	
Axle turnings	14.50 to 15.00
Low phos. punchings	16.50 to 17.00
Low phos. plates, 12 in. and under	16.50 to 17.00
Blast Furnace Grades:	
Axle turnings	10.75 to 11.25
Cast iron borings	9.75 to 10.25
Short shoveling turnings	9.75 to 10.25
Machine shop turnings	7.00 to 7.50
Rolling Mill Grades:	
Iron rails	16.00 to 16.50
Rerolling rails	17.50 to 18.00
Cupola Grades:	
Steel rails less than 3 ft.	17.75 to 18.25
Steel rails less than 2 ft.	18.25 to 18.75
Angle bars, steel	17.00 to 17.50
Cast iron carwheels	14.00 to 14.50
Malleable Grades:	
Railroad	16.75 to 17.25
Agricultural	15.50 to 16.00
Miscellaneous:	
*Relaying rails, 56 to 60 lb.	23.00 to 25.00
*Relaying rails, 65 lb. and heav.	26.00 to 31.00

Per Net Ton

Rolling Mill Grades:	
Iron angle and splice bars	15.00 to 15.50
Iron arch bars and transoms	21.00 to 21.50
Iron car axles	26.00 to 26.50
Steel car axles	16.50 to 17.00
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	13.00 to 13.50
No. 1 busheling	9.00 to 9.50
No. 2 busheling	7.00 to 7.50
Locomotive tires, smooth	14.50 to 15.00
Pipes and flues	10.00 to 10.50
Cupola Grades:	
No. 1 machinery cast	14.50 to 15.00
No. 1 railroad cast	13.75 to 14.25
No. 1 agricultural cast	13.25 to 13.75
Stove plates	12.25 to 12.75
Grate bars	11.75 to 12.25
Brake shoes	10.50 to 11.00

*Relaying rails, including angle bars to match, are quoted f.o.b. dealers' yards.

Reinforcing Bars.—Awards are at the low point of the year and, though the pending list is of good size, only a few projects appear to be near the closing stage. Fresh inquiry also is light. Demand will improve, however, if large building construction expands as it now promises to do. The Chicago, Milwaukee, St. Paul & Pacific is placing small orders—25 to 50 tons each—against an inquiry for 800 tons for track elevation. There is promise that reinforcing bars will be purchased for Illinois road work, funds for which will soon be available from the new gasoline tax. Recent awards and fresh inquiries are given on page 250.

Wire Products.—Price cutting in common wire nails is spreading and common quotations now are $2.60 to $2.75, base, per keg, Pittsburgh or Cleveland, and $1 a ton above these figures in the Chicago district. Prices for other wire products are, on the whole, little disturbed. The demand for nails, which has been below the expectations of the trade all spring and so far this summer, gives no indications of improvement in the near future. Salesmen returning from vacations have made a good showing, orders for wire having shown some improvement this week. However, neither new orders nor specifications equal production at 65 per cent of capacity and stocks in the hands of producers are slowly increasing. The jobbing trade is quiet. Distributers are cautious in placing orders, which usually are small and which are placed at frequent intervals. Crop reports, on the whole, are favorable. The past two weeks has been favorable to corn, cotton and potatoes. Some of the Northeastern States are in need of rain, as is also true in some of the extreme Northwestern States. Much of the country has had plenty of rain, while in some localities there has been an excess. Mill prices for wire and wire products are given on page 235.

Cold-Rolled Strip.—Specifications are lagging behind output, which so far has held to an 85 per cent rate. Producers look for lower output and shipments at an early date unless the market as a whole makes a turn for the better.

Coke.—July shipments are well up to the average in June and all ovens in this district are lighted. Scattered spot sales are going at $8 a net ton at the ovens.

Republic Gets First Order for Electric-Welded Pipe

YOUNGSTOWN, July 23.—Republic Iron & Steel Co. has received its first sizable order for steel pipe produced by the electrical welding method from the Southwestern Gas Co. The order calls for 200 miles of 6-in. tubing, requiring 8000 tons. The Republic Company has one mill in operation under Johnson patents manufacturing pipe up to 7 in. in diameter, and plans to install two additional mills.

International Steel & Iron Co., Evansville, Ind., recently forwarded the first bargeload of structural steel ever billed from that river port. The cargo aggregated 500 tons and was part of a 1500-ton order for a bridge to be constructed at Terryville, Tenn.

New York

Heavier Inquiry for Pig Iron—July Steel Bookings Ahead of Volume Last Year

NEW YORK, July 23.—Pig iron sales are heavier, having totaled 12,000 tons in the past week, and demand is expanding. Including 10,000 tons wanted for various plants of the American Radiator Co., pending inquiry aggregates 20,000 tons. Melt is generally holding its own and in some cases is improving. The operations of foundries making heating equipment are pointing upward as they approach fall and the heavier seasonal demands that will be felt at that time. The Chapman Valve Mfg. Co., Indian Orchard, Mass., has closed for 2000 tons, and the Worthington Pump & Machinery Corporation has bought 200 tons for its Holyoke, Mass., plant. The A. P. Smith Mfg. Co., East Orange, N. J., has placed 600 tons of No. 2 plain and No. 2X for the fourth quarter requirements of its Bloomfield foundry. The Eastern Malleable Iron Co., Naugatuck, Conn., is in the market for 1000 to 2000 tons. The competition of Alabama iron is still more of a threat than an actuality. The only large recent sale reported in this section was 50,000 tons now being shipped by the Tennessee Coal, Iron & Railroad Co. to the Burlington, N. J., pipe plant. This iron is moving by rail to Norfolk, Va., and from there by barge to destination. The proposed reduced rail and water rates from Birmingham via Savannah, Ga., and coastwise ocean vessels to North Atlantic ports have been protested, but not suspended as reported last week. The Interstate Commerce Commission has until Aug. 1 to act on the protests of Northern furnaces. Going prices on Northern pig iron show little change. On No. 2 plain, quotations lower than $17.50, Buffalo, or equivalent, are rarely reported, but silicon differentials on higher grades are frequently waived. The barge movement from Buffalo has increased, although still below the volume of a year ago. A seasonal decline in water shipments of other commodities has caused a downward revision of rates on pig iron, $2 a ton now being readily available on the haul from Buffalo to New York harbor.

Prices per gross ton, delivered New York district:

Buffalo No. 2 fdy., sil. 1.75 to 2.25	$22.41 to $22.91
*Buf. No. 2, del'd east. N. J.	20.78 to 21.28
East. Pa. No. 2 fdy., sil. 1.75 to 2.25	21.39 to 22.52
East. Pa. No. 2X fdy., sil. 2.25 to 2.75	21.89 to 23.02

Freight rates: $4.91 from Buffalo, $1.39 to $2.52 from eastern Pennsylvania.

*Price delivered to New Jersey cities having rate of $3.28 a ton from Buffalo.

Warehouse Business.—Buying since July 1 has been smaller than in June, demand for structural shapes and black and galvanized sheets having declined considerably. Prices are unchanged, but concessions on sheets of $1 to $2 a ton continue. On a recent sizable purchase of blue annealed sheets, subject to the quantity reduction of 40c. per 100 lb. from 3.90c., base, for more than 15,000 lb., the price is reported to have been 3.30c. per lb.

Cast Iron Pipe.—Inquiry from private users has been increasing recently, and there is a small tonnage of municipal business. Most producers of pressure pipe, however, are apparently in need of orders and with competition keen, prices continue from about $31 to $34 per net ton, f.o.b. Northern foundry. The Eastman Kodak Co., Rochester, N. Y., is inquiring for 6240 net tons of 30-in. pipe for delivery to Rochester about Aug. 15. The Water Supply district of Bolton Township, Bolton Landing, N. Y., opened bids July 23 on 193 tons of 6-in., 159 tons of 8-in. and 250 tons of 10-in. water pipe, a total of 612 tons. The Fox Reynolds Co., Inc., general contractor, 81 East 125th Street, New York, is asking for bids on about 14,300 ft. of 3 to 30-in. pipe for Orangeburg, N. Y., and about 4000 ft. of 4 to 30-in. pipe for Wassaic, N. Y.

Prices per net ton deliv'd New York: Water pipe, 6-in. and larger, $32.60 to $34.60; 4-in. and 5-in., $35.60 to $37.60; 3-in., $42.60 to $44.60. Class A and gas pipe, $3 extra.

Reinforcing Bars.—There has been a fair number of small jobs closed, but inquiries are light. The Chevrolet Motor Co. is taking bids on 700 tons of bars for a plant at Tarrytown, N. Y. Prices are reported firm and unchanged.

Billet steel reinforcing bars in 40, 50 and 60-ft. lengths, 2.05c. per lb., Pittsburgh, and 2.30c. per lb., Pittsburgh warehouse, for cut lengths. Out of New York warehouse, 2.90c. per lb. for lots of 5 tons or more, 3.05c. for lots of 2 to 5 tons and 3.30c. for less than 2 tons, all delivered at job.

Finished Steel.—Despite a tapering off in specifications and orders, producers of steel bars and plates declare that July bookings will show a large gain over those in the corresponding month of last year. The tonnage of plates going into the oil industry is causing favorable comment. Two large pipe line contracts, reported last week as pending, have not yet been closed. The revival of interest in shipbuilding also is expected to bring with it a demand for substantial plate tonnages. Structural steel has continued active, both from the standpoint of bookings and of fresh inquiries. The latter included 13,200 tons for section 5, route 108, of the New York subway in Queens, 3800 tons for an office building in Newark, N. J., and 3000 tons for a factory at East Hartford, Conn., for the Pratt & Whitney Aircraft Corporation. Despite a well sustained demand from consumers, the sheet market has developed further weakness. Galvanized sheets have been sold as low as 3.50c., Pittsburgh, a concession of $2 a ton from the previous week's price and a drop of $4 a ton from the level which prevailed two weeks ago. Although considerable business is still being booked at 3.60c., consumers look

Warehouse Prices, f.o.b New York

	Base per Lb.
Plates and structural shapes	3.30c.
Soft steel bars, small shapes	3.25c.

for 3.50c. as an early ruling quotation. Shading has been done in black and blue annealed sheets, but the tendency to grant lower prices has not been common.

Mill prices per lb., deliv'd New York: Soft steel bars, 2.29c.; plates, 2.22½c.; structural shapes, 2.19½c.; bar iron, 2.14c.

Coke.—Although production in the Connellsville district shows no recession despite the season, prices are well maintained. Standard furnace coke is still quoted at $2.75 to $2.85 per net ton, ovens. Special brands of beehive foundry coke are $4.85 per net ton, ovens, or $8.56 per net ton, delivered to northern New Jersey, Jersey City, and Newark, and $9.44 to New York or Brooklyn. By-product coke is quoted at $9 to $9.40 a net ton, Newark or Jersey City, and $10.06, New York or Brooklyn.

Old Material.—About 10,000 tons of No. 1 heavy melting steel has been brought by a cosumer at Coatesville, Pa., at $17 per ton, delivered. Brokers have been quoting $16.50 per ton, delivered Coatesville, on old contracts and have paid up to $16.75 per ton to obtain sufficient material. Machine shop turnings are slightly stronger, with dealers paying $11.25 per ton, delivered to Phoenixville, Pa., and up to $11.50 per ton, delivered to Conshohocken, Pa. Forge fire also shows a slight advance, with $13.75 per ton quoted on deliveries to a Coatesville, Pa., consumer. Cast scrap is rather inactive and brokers are offering about $14.50 per ton, delivered, for heavy breakable cast and $11.50 to $12, delivered, for stove plate.

Dealers' buying prices per gross ton, f.o.b. New York:

No. 1 heavy melting steel	$12.75 to $13.35
Heavy melting steel (yard)	8.00 to 9.75
No. 1 hvy. breakable cast.	10.75 to 11.75
Stove plate (steel works).	8.00 to 8.25
Locomotive grate bars....	8.25 to 8.75
Machine shop turnings....	7.25 to 7.75
Short shoveling turnings..	7.25 to 7.75
Cast borings (blast furn. or steel works).....	7.00 to 7.25
Mixed borings and turnings	6.75 to 7.25
Steel car axles.....	19.25 to 19.75
Iron car axles.....	24.00 to 25.00
Iron and steel pipe (1 in. dia., not under 2 ft. long)	10.75
Forge fire	9.75 to 10.25
No. 1 railroad wrought...	12.00 to 12.50
No. 1 yard wrought, long..	11.00 to 11.50
Rails for rolling.....	13.00 to 13.50
Cast iron carwheels.....	12.25 to 12.50
Stove plate (foundry)....	8.00 to 8.50
Malleable cast (railroad).	14.00 to 14.50
Cast borings (chemical)..	10.00 to 10.50

Prices per gross ton, deliv'd local foundries:

No. 1 machry. cast.....	$17.00
No. 1 hvy. cast (columns, bldg. materials, etc.), cupola size.....	15.00
No. 2 cast (radiators, cast boilers, etc.)	14.50

No. 9 ann'l'd wire, per 100 lb.....	$2.95
No. 9 gal. wire, per 100 lb.....	3.40
Com. wire nails, base per keg.....	2.95

*Net base, including boxing and cutting to length.

Cleveland

High Operations Assured Through August—Automobile Demand One-Third Off From Spring Peak

CLEVELAND, July 23.—The changing over by some of the automobile companies to the manufacture of new models has brought about a further slowing up in shipping orders for the grades of steel the automobile companies use. Sheets and strip steel have been affected to the largest extent. In sheet steel, takings by the automobile industry have declined probably 25 to 35 per cent from the peak rate of the spring, according to some estimates.

New models are being brought out by Buick, Chrysler, Reo and Hudson, and it is expected in the steel trade that orders from these companies will again show an upward trend in August.

Many of the sheet mills still have large backlogs in some finishes, but the need for new business, particularly in the common finishes, is bringing out some price concessions on heavy gage blue annealed material, while on black sheets 2.85c., Pittsburgh, now appears to be the maximum obtainable except in a few special instances where the black sheet base is used for sheets of higher finishes. In products other than those used by the automobile industry, the July demand is holding at a high rate.

In plates, shapes and bars, orders and specifications are keeping pace with the June volume. A leading producer has, in fact, booked more tonnage in these products this month than in the corresponding period in June.

Mill operations are being held at virtually a maximum rate. Orders now on the books, with those which can be counted upon, assure steady output through August, although it may be at a slightly reduced pace. Shipments are greater than incoming business, with resultant reduction in backlogs.

Iron Ore.—Consumption of Lake Superior iron ore declined 303,596 tons in June, as compared with May, according to figures compiled by the Lake Superior Iron Ore Association. The June total was 5,676,652 and that for May was 5,980,248 gross tons. The June consumption was more than 1,000,000 tons greater than that of the same month last year, the figure for June, 1928, having been 4,667,493. Ore on hand as of July 1 at furnaces and on docks was 23,701,011 tons, of which 19,618,611 tons was at furnaces and 4,082,400 tons was on Lake Erie docks. The number of furnaces using Lake ore which were in blast on the last day of June was 197, one more than on the last day of May.

Pig Iron.—Sales of pig iron in the past week, at about 20,000 tons, were almost double those of the preceding week. Shipments as well as sales have gained, although not so much iron is going to consumers as was shipped last month. However, the leading producers are moving as much as they are making. Inquiry is not very heavy, nor is it expected to be within the next 30 days or so, as melters generally are well covered for the quarter and furnaces have substantial backlogs. There was a good-sized carryover tonnage from the second quarter. Not much interest is being shown by melters in the fourth quarter. However, an inquiry for 5000 tons from an Indiana company, which probably will be closed this week, is for shipment over the remainder of the third quarter and all of the fourth quarter. Prices are holding firm at $18.50, Cleveland, for outside shipment, at $19 for local delivery, and $20, Lake furnace, for Michigan territory. While the break in prices of Alabama pig iron may have made buyers cautious, it has had no other effect on the pig iron situation in the Cleveland district. Northern consumers have become educated to the use of pig iron that runs lower in phosphorus and higher in manganese than does the Southern iron, and offers of Southern iron hereabouts have not resulted in much business. Demand for low phosphorus iron is very quiet, but prices are unchanged at $26.50 to $27, furnace.

Prices per gross ton at Cleveland:

N'th'n fdy., sil. 1.75 to 2.25	$19.50
S'th'n fdy., 1.75 to 2.25....$20.00 to	20.50
Malleable	19.50
Ohio silvery, 8 per cent...	28.00
Basic Valley furnace.....	18.50
Stand. low phos., Valley.. 26.50 to	27.00

Prices except on basic and low phosphorus are delivered Cleveland. Freight rates: 50c. from local furnaces; $3 from Jackson, Ohio; $6 from Birmingham.

Semi-Finished Steel.—The leading local producer of semi-finished steel has its entire third-quarter output under contract and has actual specifications on hand for three weeks' rollings. The price situation seems to have become stabilized at $35, Cleveland, Youngstown or Pittsburgh, for billets, slabs and sheet bars.

Reinforcing Steel.—Demand loeally has struck a midsummer lull. A clothing factory for Richman Brothers in Cleveland, on which the general contract has been let, will take 300 tons.

Warehouse Business.—Local warehouses report that business is continuing at a good rate, although it is somewhat less than that done in June. Prices are steady.

Bolts, Nuts and Rivets.—Business in bolts and nuts so far in July is larger than during the same number of days in June. The tonnage in rivets, however, is light, but is running about the same as in June, which showed a falling off from the preceding months. Prices are unchanged.

Plates, Shapes and Bars.—Demand for the heavy hot-rolled products is much better this month than was expected. Consumption of plates by car builders, boiler manufacturers and other leading consumers has shown no marked decline. In fact, a leading seller of these lines has booked more business in July so far than in the same number of days in June. The structural market is quiet in new lettings, but a fair amount of work is in prospect. The jail courts building in Cleveland, on which bids will soon be requested, will take 1500 to 2000 tons and the Akronia Hotel, at Akron, plans for which will be out shortly, will require a thousand tons or more. An inquiry of interest to plate manufacturers is for a small tonnage of 2 to 3 per cent nickel steel plates for the boiler shells for 12 locomotives for the Great Northern Railway. Nickel steel plates for this purpose have been extensively used by the Canadian railroads. Prices of plates, shapes and bars are steady.

Sheets. — Orders from automobile manufacturers and body builders have shown a further decline. Some sellers estimate that current shipping orders represent a drop of 25 to 35 per cent from the peak rate of May and early June. While many sheet mills still have comfortable backlogs, especially in full finished sheets, the need for new tonnage is becoming more of a factor in the common finishes and heavier gages. The weakness in blue annealed sheets, referred to a week ago, affects chiefly the heavy gages now classified as light plates. Although many of the jobbing mills are adhering to 2.20c., Pittsburgh base, for No. 10 gage, sales have been made at 2.10c. and in special instances at 2c. Light blue annealed sheets, which take a 2.35c., Pittsburgh base, are firm. On black sheets, 2.85c., Pittsburgh, is general to nearly all buyers, 2.95c. having virtually disappeared even as an asking price. Galvanized sheets are being quite generally sold at 3.60c., Pittsburgh, to consumers and at 3.50c. to jobbers.

Strip Steel.—Demand for hot-rolled and cold-rolled strip steel has slumped. Mills still have a fair amount of business in hot-rolled on their books, but some cold rollers need orders. The result is that the recent minimum price of 2.75c., Pittsburgh or Cleveland, on cold rolled is now available on lots which had been commanding a premium of $2 a ton.

Wire Products.—Specifications for wire from the automobile industry are considerably lighter. Wire nails are dull and there are some irregularities in prices.

Old Material.—In the absence of new buying by local steel mills the scrap trade is marking time. Continued high operations of the steel mills and the strength in the Pittsburgh and Youngstown markets have given the local market an undertone of strength notwithstanding the slack demand here. Two local consumers of heavy melting steel are still restricting shipments from dealers, partly because of the deliveries they are getting from Detroit by boat. Prices are unchanged.

Prices per gross ton delivered consumers' yards:

Basic Open-Hearth Grades	
No. 1 heavy melting steel	$15.00 to $15.50
No. 2 heavy melting steel	14.50 to 15.00
Compressed sheet steel	14.50 to 15.00
Light bundled sheet stampings	12.00 to 12.50
Drop forge flashings	13.00 to 13.25
Machine shop turnings	9.25 to 9.50
No. 1 railroad wrought	13.50 to 14.00
No. 2 railroad wrought	16.00 to 16.50
No. 1 busheling	13.25 to 13.75
Pipes and flues	9.00 to 9.50

Philadelphia

Steel Buying Smaller But Mill Operations High—Southern Basic Sold In Small Tonnages

PHILADELPHIA, July 23.—Despite the slackening of specifications, usual at this season, steel mill operations are maintained at a high rate. Deliveries range from two to four weeks on bars and plates, but are fairly prompt on shapes and sheets. Prices are firm except on black and galvanized sheets, which have settled about $2 a ton in recent weeks.

Although Southern pig iron continues to offer low-priced competition in this district, eastern Pennsylvania furnaces are maintaining prices at their former level. Strength in the iron and steel scrap market is largely in heavy melting steel.

Pig Iron.—Southern pig iron is freely offered at $13.50 per ton, furnace, for basic and $14.50, furnace for foundry iron, but buying continues rather limited. For barge shipment, via Norfolk, Va., sellers of Birmingham iron have quoted a rail and water rate, loaded on cars Philadelphia of $5 a ton, plus the rail rate to consumer's plant. On basic iron, quotations have been made of $19.63 and $20.13 per ton, delivered, which compares with an eastern Pennsylvania basic price of $20 per ton, furnace. A large user in this district is reported to have closed on a trial tonnage of Southern basic at about $19.50 a ton, delivered. A Pencoyd, Pa., user of basic is reported to be receiving shipment of about 5000 tons of basic iron from Birmingham. In the past week, eastern Pennsylvania pig iron producers have followed the action of eastern railroads in protesting to the Interstate Commerce Commission, reductions of rail and water rates on Southern pig iron to Atlantic Coast ports. Foundry iron demand is small with prospective buyers showing no haste in placing orders in view of the low prices quoted by Birmingham sellers. Thus far eastern Pennsylvania producers have, as a rule, maintained a minimum of $21, furnace, on foundry.

Prices per gross ton at Philadelphia:

East. Pa. No. 2, 1.75 to 2.25 sil.	$21.76 to $22.26
East. Pa. No. 2X, 2.25 to 2.75 sil.	22.26 to 22.76
East. Pa. No. 1X	22.76 to 23.26
Basic (del'd east. Pa.)	20.25 to 21.00
Gray forge	20.50 to 21.00
Malleable	21.25 to 21.75
Stand. low phos. (f.o.b. N. Y. State furnace)	22.00 to 23.00
Cop. b'r'g low phos. (f.o.b. furnace)	23.50 to 24.00
Va. No. 2 plain, 1.75 to 2.25 sil.	24.04
Va. No. 2X, 2.25 to 2.75 sil.	24.54

Prices, except as specified otherwise, are deliv'd Philadelphia. Freight rates: 76c. to $1.64 from eastern Pennsylvania furnaces; $4.54 from Virginia furnaces.

Bars.—Deliveries range from two to four weeks and the price is firm at 1.95c. per lb., Pittsburgh, or 2.27c., delivered Philadelphia. Mills are maintaining a high rate of operation, although since the beginning of the present quarter buying has been smaller.

Reinforcing Bars. — Low bidder for the general contract on the Ridge Avenue subway, which requires 1000 tons of bars, was the Keystone State Construction Co. About 475 tons of reinforcing bars in the Coatesville General Hospital at Coatesville, Pa., have

been awarded to the Truscon Steel Co. Rail steel bars are quoted at about 1.95c., Franklin, Pa., or Tonawanda, N. Y., or 2.27c., delivered Philadelphia, with no extra for cutting to length. Billet steel reinforcing bars are quoted at 1.95c., to 2.05c., Pittsburgh, or 2.27c. to 2.37c., delivered Philadelphia, with $5 extra for cutting to length. Occasionally the extra for cutting is omitted to meet the competition of rail steel bars.

Shapes.—Mills are well engaged, especially on the smaller sizes and deliveries range from a week to three weeks in some instances. Quotations are unchanged at 1.95c. to 2c. and occasionally 2.05c., f.o.b. nearest mill to consumer, or 2.01c. to 2.06c. and occasionally 2.11c., delivered Philadelphia.

Plates.—Buying is well distributed with the railroads and car builders particularly active. The contracts for building merchant ships and the cruisers for the Navy have not yet been formally approved, but mills are so well provided with tonnage at present that the delay is considered desirable, as the tonnage may be needed more later in the quarter than at present. A new avenue of plate consumption appears to be opening in their use for floor construction in buildings. The four-story addition to the Congressional Library in Washington requires about 200 tons of ¼-in. narrow plates. Prices are firm at 2.05c., Coatesville, or 2.15c., delivered Philadelphia.

Sheets.—Automobile body builders in this district are buying a fair tonnage of sheets and radio manufacturers have bought a substantial tonnage of deep drawing and electrical sheets and have not yet satisfied their requirements for this year. Blue annealed sheets, No. 13 gage are 2.35c. per lb., Pittsburgh, or 2.67c., delivered Philadelphia, and light plates, blue annealed, No. 10 gage are 2.20c. per lb., Pittsburgh, or 2.52c., delivered Philadelphia. Black and galvanized sheets are quoted at 2.85c., Pittsburgh, or 3.17c., Philadelphia, for black and 3.60c., Pittsburgh, or 3.92c., delivered Philadelphia, for galvanized. Concessions of about $1 a ton are sometimes obtainable on desirable orders.

Warehouse Business. — Prices are well maintained, but the volume of business this month is appreciably smaller than in June.

Imports.—In the week ended July 20, a total of 4474 tons of chrome ore arrived at this port from Portuguese Africa. Steel imports consisted of 72 tons of steel bars, 78 tons of structural shapes and 29 tons of steel bands from Belgium, 261 tons of structural shapes, 14 tons of steel bands and 13 tons of bars from France and 24 tons of billets and 27 tons of steel rods from Sweden. Scrap arrivals totaled 29 tons from the United Kingdom and 6 tons from Germany.

Old Material. — A large eastern Pennsylvania consumer has closed on upward of 10,000 tons of No. 1 heavy melting steel at $17 a ton, delivered. Supplies of No. 2 steel are not large and brokers with contracts for delivery to Conshohocken and Pencoyd, Pa., are paying up to $14.25 and $14.50 per ton, delivered, to fill their orders. Low phosphorus scrap is lacking in strength, and prices of heavy breakable cast are less firm than the market on other grades of scrap.

Prices per gross ton delivered consumers' yards, Philadelphia district:

No. 1 heavy melting steel	$16.50 to $17.00
Scrap T rails	16.00
No. 2 heavy melting steel	12.50 to 14.25
No. 1 railroad wrought	16.00 to 16.50
Bundled sheets (for steel works)	11.50
Hydraulic compressed, new	14.50 to 15.00
Hydraulic compressed, old	12.00 to 12.50
Machine shop turnings (for steel works)	11.50 to 12.00
Heavy axle turnings (or equiv.)	14.00 to 14.50
Cast borings (for steel works and roll. mill)	11.00 to 11.50
Heavy breakable cast (for steel works)	15.00 to 15.25
Railroad grate bars	12.00 to 12.50
Stove plate (for steel works)	12.00 to 12.50
No. 1 low phos., hvy., 0.04% and under	22.00 to 23.00
Couplers and knuckles	19.50 to 20.50
Rolled steel wheels	19.50 to 20.50
No. 1 blast f'nace scrap	10.50 to 11.00
Wrot. iron and soft steel pipes and tubes (new specific.)	15.00
Shafting	19.00 to 19.50
Steel axles	23.00 to 23.50
No. 1 forge fire	14.00
Cast iron carwheels	16.50 to 17.00
No. 1 cast	16.50 to 17.00
Cast borings (for chem. plant)	14.50
Steel rails for rolling	16.50 to 17.00

The Wean Engineering Co., Inc., Warren, Ohio, has become the selling company in the United States and Canada for the McKay Machine Co., Youngstown, Ohio, maker of roller leveling equipment. Flinn & Dreffein Co., Chicago, is associated with the Wean company as furnace contractors and combustion engineers on continuous pack heating furnaces for sheet and tin mills.

The American Railway Tool Foremen's convention, which will be held this year at the Hotel Sherman, Chicago, Sept. 11, 12 and 13, will be featured by an exhibit in charge of the supply organization subsidiary to the association, of which supply association, C. C. Ziegler, Greenfield Tap & Die Corporation, 611 West Washington Boulevard, Chicago, is secretary.

Methods of investigating individual industrial accidents are presented in a pamphlet issued by the National Safety Council. An appendix sets forth the system used by E. I. du Pont de Nemours & Co., and a description of the court of inquiry conducted by the American Steel & Wire Co.

The first of four new sheet mills of the Continental Steel Corporation plant at Kokomo, Ind., has been started and the remainder will be put in operation shortly.

Railroad Equipment

Wabash Purchases 25 Large Freight Locomotives

PURCHASE of 25 large freight locomotives by the Wabash was the feature of the past week in the railroad equipment market. The Texas & Pacific is inquiring for 15 locomotives. The Great Northern Equipment Co. is taking bids on 300 flat cars and 300 flat car underframes. Details of the week's business follow:

Wabash has ordered 25 large freight locomotives from Baldwin Locomotive Works.

Cearense Railroad of Brazil has ordered three locomotives from Baldwin Locomotive Works.

Campbell River Timber Co. has ordered one locomotive from Baldwin Locomotive Works.

Great Northern Equipment Co. is inquiring for 300 flat cars and 300 flat car underframes.

New York, New Haven & Hartford is asking for bids on 75 coke car bodies of 40 tons capacity each.

Texas & Pacific will buy 15 Texas type locomotives.

Extra Dividend on Jones & Laughlin Stock

Jones & Laughlin Steel Corporation reports net income of $6,051,508 after deductions for Federal taxes, depreciation, depletion and bond interest, for the quarter ended June 30. Net income for the six months ended June 30 is $11,305,687, after preferred and common dividends. The balance carried to surplus in the last quarter was $3,727,273 and $7,233,538 in first half.

Regular quarterly dividends of 1¾ per cent on preferred and 1½ per cent on common stock were declared, and also an extra dividend of 1 per cent on common stock.

Cleveland engineers are planning on an engineers' day during the Cleveland Air Races and Airplane Show which is to be held the latter part of August. The program is under the joint auspices of the Cleveland Engineering Society and the aeronautic division and Cleveland section of the American Society of Mechanical Engineers. One session will be devoted to seaplane and flying-boat development.

A net loss of $61,011.56 for the second quarter was reported for the Virginia Iron, Coal & Coke Co., Roanoke, Va. The first quarter showed a profit of $33,048.15, so that the results of operations for six months ended June 30 is a net loss of $27,963.41.

Radio talks are being given by the Clipper Belt Lacer Co., over the Madison Square Garden Station, W.M.S.G., New York. These talks started on May 25 and will be put on four times a week for a period of six months.

Pacific Coast

Pipe Line Calling for 5000 Tons Placed—Structural Awards Total 7000 Tons—Rivets Active

SAN FRANCISCO, July 20 (*By Air Mail*). — Movement of steel products on the Pacific Coast shows few signs of diminishing, and bookings this week were in fair volume. An award of 5000 tons of plates for a pipe line in Vancouver, B. C., was placed, and bids have been opened on a 3700-ton riveted steel pipe line for Seattle. A number of important reinforcing steel bar projects were placed, including 675 tons for a school in San Francisco and 500 tons for a college building in Berkeley, Cal.

Considerable interest has been aroused in recent reports regarding the acquisition of the Columbia Steel Corporation by the United States Steel Corporation and the contemplated purchase by the latter company of a large industrial site near the Columbia Steel Corporation's present property in Pittsburg, Cal. Verification, however, could not be obtained.

Pig Iron.—Foundry operations are of such a character that demand for foundry iron remains more or less spotty, the majority of sales and inquiries being small. Pig iron quotations are unchanged.

Prices per gross ton at San Francisco:

*Utah basic	$25.00 to $26.00
*Utah fdy., sil. 2.75 to 3.25	25.00 to 26.00
**Indian fdy., sil. 2.75 to 3.25	25.00 to 26.00

*Delivered San Francisco.
**Duty paid, f.o.b. cars San Francisco.

Bars.—Awards of reinforcing bars were the largest of any week of the year to date and brought the total for 1929, for the first time since the early part of April, above the aggregate for the corresponding total of last year. Important bookings included 800 tons for two buildings in Berkeley, placed with the Soule Steel Co.; 370 tons for an apartment in San Francisco, secured by W. C. Hauck & Co., and close to 600 tons for two factories in San Francisco, taken by the Pacific Coast Steel Co. Although most pending inquiries are for less than 100 tons, the West Garfield Street bridge in Seattle calls for 1150 tons. Out-of-stock prices in San Francisco continue at 2.20c. a lb., base, on carload lots, with 2.60c. a lb. applying on smaller tonnages. Los Angeles out-of-stock prices are $2 a ton higher. Merchant bars continue to move in small lots only, and 2.35c. a lb., c.i.f. Coast ports, appears to be general on this class of material.

Plates.—The Vancouver Engineering Works was awarded 5000 tons of plates for a pipe line for Vancouver, B. C. Other lettings of the week included seven steel tanks, ranging in size from 65,000 to 200,000 gal., for the Southern Pacific Co., San Francisco, to be installed at various points in California and Nevada. The Western Pipe & Steel Co. took 125 tons for a siphon for a reclamation project at Vale, Ore., while the Seattle Boiler Works secured 150 tons for a burner at Klamath Falls, Ore., for the Weyerhaeuser Timber Co. Bids were opened this week on 3700 tons for a riveted steel pipe line at Seattle. Prices remain firm at 2.35c. a lb., c.i.f. Coast ports.

Shapes. — Demand for structural shapes is being well maintained, and awards this week exceeded 7000 tons. Most of these projects, however, called for lots of from 100 to 200 tons. The Virginia Bridge & Iron Co. took two bridges for the Pacific Electric Co., Los Angeles, requiring 252 tons. An apartment in San Francisco calls for 200 tons, and a sorting rack for a timber company in Oregon for 250 tons. Plain material is firm at 2.35c. a lb., c.i.f. Coast ports.

Rivets.—Activity among the plate fabricating plants on the Pacific Coast has resulted in a stream of orders for rivets, and business booked so far this year is estimated to be in excess of that entered for the entire year 1928. Prices on large rivets appear to be firm at $3.10 a 100 lb., Pittsburgh.

Cast Iron Pipe.—Only three awards were reported placed this week. The American Cast Iron Pipe Co. took 225 tons for the improvement of West Dravus Street, Seattle. Bert Noble secured 145 tons of 4 to 12-in. Class B pipe for the improvement of Fifty-fifth Street, San Diego, Cal. Newport Beach, Cal., placed 724 tons of 4 to 12-in. Class B pipe for the improvement of Lido Island with the Underground Construction Co. On 1012 tons of 4 to 12-in. Class B pipe for Pasadena, Cal., the United States Pipe & Foundry Co. and the Pacific States Cast Iron Pipe Co. were low bidders, the latter company on the 4-in. pipe. The East Bay Municipal Utility District, Oakland, Cal., has made no award, as yet, on its project calling for 2331 tons of 6 to 20-in. Class B or centrifugal pipe. Bids were opened this week on 185 tons of 4 to 12-in. Class B pipe for the improvement of Broadway, Santa Monica, Cal. Bids were also opened by Alhambra, Cal., for 360 tons of Class B pipe. San Diego will open bids on Aug. 5 for 145 tons of 4 and 6-in. Class B pipe for the improvement of Redwood Street.

Warehouse Prices, f.o.b. San Francisco

	Base per Lb.
Plates and struc. shapes	3.15c.
Soft steel bars	3.15c.
Small angles, ¾-in. and over	3.15c.
Small angles, under ¾-in.	3.55c.
Small channels and tees, ¾-in. to 2¾-in.	3.75c.
Spring steel, ¼-in. and thicker	5.00c.
Black sheets (No. 24)	4.90c.
Blue ann'l'd sheets (No. 10)	3.80c.
Galv. sheets (No. 24)	5.30c.
Struct. rivets, ½-in. and larger	5.65c.
Com. wire nails, base per keg	$3.40
Cement c't'd nails, 100 lb. keg	3.40

Birmingham

Pig Iron Sold in East—Steel Buying Tapers But Mill Output Is Undiminished

BIRMINGHAM, July 23.—Buyers are apparently satisfied that the present base price will continue, as actual requirements are the main factor in current purchases. Buying has been in much smaller volume than was expected by furnace interests when prices were reduced for the second time, early this month. Last week's sales to district consumers were at about the same rate as in the previous week. A good portion of current business consists of spot orders from the smaller foundries. Several sales are reported made to East Coast points pending the establishment of the new combination rail and barge rates to Baltimore, Philadelphia, New York and Boston, which are scheduled to become effective Aug. 12, and it is expected that the movement of iron to those points will be important. The sale of Birmingham iron to the East so far has been of an introductory character. The Tennessee company has been shipping iron for some time to two large foundries in the East, one of which is a subsidiary company. It is reported that 15,000 tons of Birmingham iron will be shipped to the Louisville, Ky., plant of the Standard Sanitary Mfg. Co. The total number of active blast furnaces in this district remains at 17. Nine are on foundry iron, seven on basic and one on recarburizing iron.

Prices per gross ton, f.o.b. Birmingham dist. furnaces:

No. 2 fdy., 1.75 to 2.25 sil.	$14.50
No. 1 fdy., 2.25 to 2.75 sil.	15.00
Basic	14.50

Finished Steel.—A further tapering off in the volume of new business has reduced it to a point where it is not quite equal to present shipments. Operations remain at the highest rate of the year, which is only a little under capacity for most of the mills. Order books are sufficient to support production at the present gait for from three to four weeks without the addition of further tonnage. Inquiries for bars, plates and shapes, though not so brisk as two weeks ago, are still much heavier than is usual for this season. Prices are unchanged. Structural steel fabricators report several important projects in prospect for the next few weeks. New orders of the Nashville Bridge Co. include over 4000 tons for towers for a transmission line near Memphis, Tenn., 200 tons for Alabama highway bridges and 125 tons for a bridge at Aberdeen, Miss. Reinforcing bar orders are in small lots, with

a fairly satisfactory aggregate. Only one open-hearth furnace is idle out of a total of 23, as has been the case for three weeks.

Cast Iron Pipe.—A few inquiries from the Middle West were the main developments in the pressure pipe market during the past week. Included was a project at Chicago, requiring about 1600 tons, to be awarded July 23. The United States Pipe & Foundry Co. is low bidder on 2331 tons of 6 to 20-in. pipe for Oakland, Cal. This company has been awarded 20,800 ft. of 6 and 8-in. pipe for Houston, Miss. The American Cast Iron Pipe Co. has booked 200 tons for Mountain City, Tenn. The placing of about four miles of 8 to 12-in. pipe for Hollywood, Fla., has been postponed until Aug. 15. West Greenville, S. C., will open bids July 30 for 20,000 ft. of 6 and 8-in. pipe. The project at Griffin, Ga., requiring nine miles of 16 to 20-in. pipe will be awarded about Sept. 1. Shipments this month have exceeded those of the comparable period of last month, being a little better than production. Prices are steady at $37 to $38 a net ton, Birmingham.

Coke.—Foundry coke under contract is moving in fairly satisfactory volume for this season. Prices are unchanged at $5 a net ton, Birmingham.

Old Material.—Several of the larger consumers are continuing to specify much less than their usual tonnages and the market remains slow. Smaller consumers are buying small lots as needed for current requirements. Practically no cast iron scrap is being sold. Prices are unchanged but weak.

Prices per gross ton, deliv'd Birmingham dist. consumers' yards:

Heavy melting steel	$12.50
Scrap steel rails	12.50
Short shoveling turnings	9.00
Cast iron borings	9.00
Stove plate	$11.50 to 12.00
Steel axles	21.00
Iron axles	23.00
No. 1 railroad wrought	10.00 to 10.50
Rails for rolling	14.00 to 15.00
No. 1 cast	13.50
Tramcar wheels	13.00
Cast iron carwheels	12.50 to 13.00
Cast iron borings, chem.	13.50 to 14.00

St. Louis

Advances in Scrap—New Business in Finished Steel Light —Demand for Pig Iron Lags

ST. LOUIS, July 23.—Melters seem wary of the pig iron market, in view of recent reductions by the Southern makers, and most purchases are being made only for immediate needs. The St. Louis Gas & Coke Corporation sold only 1850 tons, all for third quarter shipment, including 500 tons to an Iowa jobbing foundry, 300 tons to an Illinois equipment maker and 200 tons to an Illinois melter, all foundry, and 350 tons of malleable to an Illinois concern. The local maker has made no change in its prices despite two recent reductions of 50c. a ton by Southern interests. Shipments continue heavy.

Prices per gross ton at St. Louis:

No. 2 fdy., sil. 1.75 to 2.25, f.o.b. Granite City, Ill.	$20.00
Malleable, f.o.b. Granite City	20.50
N'th'n No. 2 fdy., deliv'd St. Louis	22.16
Southern No. 2 fdy., deliv'd	18.92
Northern malleable, deliv'd	22.16
Northern basic, deliv'd	22.16

Freight rates: 75c. (average) Granite City to St. Louis; $2.16 from Chicago; $4.42 from Birmingham.

Old Material.—For some time shipments to this market have been light, and dealers have increased prices to stimulate the movement. There is said to be a considerable short interest in No. 1 heavy melting steel, and in several other items. Consumers are showing more interest in the market, but dealers are reluctant to book business at present prices. Railroad lists, which are unusually light, follow: Chicago & Alton, 950 tons; International-Great Northern, 6926 tons; St. Louis & San Francisco, 42 carloads; Cotton Belt, 16 carloads; Nashville, Chattanooga & St. Louis, 10 carloads, and Chicago & Eastern Illinois, six carloads.

Dealers' buying prices per gross ton, f.o.b. St. Louis district:

No. 1 heavy melting or shoveling steel	$13.75 to $14.25
No. 2 heavy melting or shoveling steel	12.75 to 13.25
No. 1 locomotive tires	15.00 to 15.50
Miscel. stand.-sec. rails including frogs, switches and guards, cut apart	15.75 to 16.25
Railroad springs	18.00 to 18.50
Bundled sheets	9.50 to 10.00
No. 2 railroad wrought	13.75 to 14.25
No. 1 busheling	10.00 to 10.50
Cast iron borings and shoveling turnings	9.50 to 10.00
Iron rails	15.00 to 15.50
Rails for rolling	16.25 to 16.75
Machine shop turnings	8.00 to 8.50
Heavy turnings	9.75 to 10.00
Steel car axles	19.00 to 19.50
Iron car axles	26.50 to 27.00
Wrot. iron bars and trans.	22.00 to 22.50
No. 1 railroad wrought	13.00 to 13.50
Steel rails, less than 3 ft.	17.50 to 18.00
Steel angle bars	14.25 to 14.75
Cast iron carwheels	14.50 to 15.00
No. 1 machinery cast	15.50 to 16.00
Railroad malleable	15.50 to 16.00
No. 1 railroad cast	15.00 to 15.50
Stove plate	12.50 to 13.00
Agricult. malleable	15.00 to 15.50
Relay. rails, 60 lb. and under	20.50 to 23.50
Relay. rails, 70 lb. and over	26.50 to 29.00

Coke.—A shortage of foundry coke is reported, there being an especially good demand from melters in this area. Shipments of furnace coke to district smelters continue heavy. The usual seasonal dullness prevails in the domestic coke trade.

Finished Steel.—Specifications for plates, shapes and bars are reaching the mills as contracts require, but no new business of consequence is being placed. The demand for tank plates and blue annealed sheets continues good. The American Bridge Co. got the first sizable structural order for some time, 450 tons for a Woolworth building. A number of large projects are being discussed by financial interests, but the largest definitely before the trade is a Mack Truck service station, 350 tons.

Warehouse Prices, f.o.b. St. Louis

	Base per Lb.
Plates and struc. shapes	3.25c.
Bars, soft steel or iron	3.15c.
Cold-fin. rounds, shaftings, screw stock	3.75c.
Black sheets (No. 24)	4.25c.
Galv. sheets (No. 24)	5.10c.
Blue ann'l'd sheets (No. 10)	3.45c.
Black corrug. sheets (No. 24)	4.30c.

Cincinnati

Scrap Stronger—Interest in Pig Iron Lacking

CINCINNATI, July 23.—Sales of pig iron have declined noticeably, and the market generally is dull as buyers feel their way before entering the market. Such iron as has been purchased has been bought quietly in small quantities, chiefly in carload lots. Despite this lull in activity, Northern pig iron continues firm at about $18.50 base, furnace. On the other hand, Southern iron is still weak at $14.50 base, Birmingham, with strong indications that concessions on quantity orders would be granted. The Marmon Motor Car Co., Indianapolis, is inquiring for a quantity of Northern foundry iron, ranging from 2500 to 5000 tons, depending on whether the company takes material only for third quarter or for the entire second half. A Muncie, Ind., consumer is asking for 600 tons of the same grade.

Prices per gross ton, deliv'd Cincinnati:

So. Ohio fdy., sil. 1.75 to 2.25	$19.89 to $20.39
Ala. fdy., sil. 1.75 to 2.75	17.69 to 18.19
Ala. fdy., sil. 2.25 to 2.75	18.19 to 18.69
Tenn. fdy., sil. 1.75 to 2.25	17.69 to 18.19
S'th'n Ohio silvery, 8 per cent	26.89

Freight rates, $1.89 from Ironton and Jackson, Ohio; $3.69 from Birmingham.

Finished Material.—The usual seasonal recession of buying activity is being felt by district sheet mills and, consequently, backlogs are being slowly reduced. Interest in galvanized

Warehouse Prices, f.o.b. Cincinnati

	Base per Lb.
Plates and struc. shapes	3.40c.
Bars, soft steel or iron	3.30c.
New billet reinforc. bars	3.15c.

Cement c't'd nails, base 100 lb. keg	2.85
Chain per 100 lb	8.75

	Net per 100 Ft.
Lap-weld steel boiler tubes, 2-in.	$16.00
4-in.	33.00
Seamless steel boiler tubes, 2-in.	17.00
4-in.	34.00

sheets for roofing is increasing and is tending to offset to a small degree the sagging demand for other lines. Specialty sheets continue to command attention, as manufacturers of electrical devices, steel furniture and partitions are maintaining production at a good rate. On the other hand, demand for blue annealed sheets is off.

Coke.—Except for the sale of 5000 tons of New River foundry coke to an Illinois consumer, new business has been confined to spot shipments for immediate use. However, specifications on current contracts continue at a good rate and in better quantity than last month. Prices on by-product foundry coke, delivered in Cincinnati, will continue at $10.05 during August.

Old Material.—Although no sales of large tonnages have been reported, consumers are taking old material on commitments at a fair rate and dealers are finding it difficult to obtain good scrap to apply on contracts. Dealers are paying 25c. more a ton for heavy melting steel and No. 2 railroad wrought than a week ago. The price on bundled sheets has increased 50c. a ton, while sheet clippings are down 25c.

Dealers' buying prices per gross ton, f.o.b. cars, Cincinnati:

Heavy melting steel	$13.50 to $14.00
Scrap rails for melting	13.75 to 14.25
Loose sheet clippings	9.00 to 9.50
Bundled sheets	11.00 to 11.50
Cast iron borings	9.00 to 9.25
Machine shop turnings	8.50 to 8.75
No. 1 busheling	10.50 to 11.00
No. 2 busheling	6.75 to 7.00
Rails for rolling	14.50 to 15.00
No. 1 locomotive tires	14.25 to 14.75
No. 2 railroad wrought	13.25 to 13.75
Short rails	18.50 to 19.00
Cast iron carwheels	12.75 to 13.25
No. 1 machinery cast	19.25 to 19.75
No. 1 railroad cast	15.25 to 15.75
Burnt cast	10.25 to 10.75
Stove plate	10.25 to 10.75
Brake shoes	10.25 to 10.75
Railroad malleable	15.25 to 15.75
Agricultural malleable	14.25 to 14.75

Youngstown

Specifications Declining in Sheets, Strips and Bars, But Production Remains High

YOUNGSTOWN, July 23. — Although new business has been falling off steadily in the last two or three weeks, Valley district steel makers are still being pressed for deliveries on many products and operations have declined very little from the high rate of April and May. Curtailment in the sheet mills and, to a lesser extent, in open-hearth production has been necessitated by hot weather. Repairs to furnaces are also required from time to time, but not more than two or three of the available open-hearth furnaces in the district are usually allowed to be idle at one time and steel output is at record proportions for the summer season.

The principal declines in specifications have been in sheets and strips and more recently in bars. On sheets, however, mill backlogs are so large, even on the common finishes, that declining tonnage releases will have no effect on output for several weeks and revived automobile specifications are expected to appear before that time. Shipments to the automobile and parts makers serving the Ford and Chevrolet companies have not lessened, the decline in production by Michigan companies being confined largely to the makers of cars in the medium-priced class. On hot and cold-rolled strips backlogs have been generally reduced and business is on the hand-to-mouth basis that usually prevails at this time of the year. On bars deliveries range from two to four weeks, but better shipments are rapidly becoming possible.

The pipe business has been steadily growing more encouraging, and Youngstown companies will have an opportunity of quoting on several hundred thousand tons of line pipe in the next few weeks. Line pipe business now on company books is fairly satisfactory, but standard pipe is below expectations. The Republic Iron & Steel Co. is making shipments from the first unit of its electric-welded pipe plant in sizes up to 6⅝ in. and work is progressing rapidly on the mills that will make larger sizes. The Youngstown Sheet & Tube Co. is also experimenting on electrically-welded pipe and is reported to be making rapid progress in the development of a marketable product.

Tin mills are operating at close to physical capacity and business coming in promises to hold these schedules for several weeks.

Price weakness in sheets and strip is not generally recognized by the larger mills in the district because of their large backlogs on most products. However, business is being taken at 3.60c. and 2.85c., Pittsburgh, respectively on black and galvanized sheets and these figures are more representative of the market than higher quotations. Although prices $1 and $2 a ton under the above figures are growing more common, they are not being met by Youngstown mills, which are also holding firmly to the 2.20c. and 2.35c., Pittsburgh, quotations on light plates and blue annealed sheets. In other districts concessions of $2 a ton have appeared on these products, as well as on the 3c. price on tin mill black plate. Hot-rolled strip is steady at 1.90c. and 2c., Pittsburgh or Cleveland, and the market on cold-rolled strip is now well represented by 2.75c.

On sheet bars, billets and slabs $35 is the ruling quotation, and non-integrated mills have generally contracted for third quarter at that figure. Semi-finished steel is still rather hard to buy in the open market, although contract business is being taken care of satisfactorily.

The pig iron market is firm at $18.50, Valley, for the foundry and basic grades and $19 for malleable and Bessemer. There is little buying except in small lots, but shipments against old contracts are holding up well and furnace stocks are at the lowest point in years. The Cherry Valley stack of the Davison Coke & Iron Co. is expected to be blown in during August, and the Claire furnace of the same company will go out for relining in the near future.

The scrap market reflects the strength of the Pittsburgh district, and sales of heavy melting steel have been made during the last week at $18.50, delivered to Valley mills. Hydraulic compressed sheets are quotable at $17.50 to $18, or about 50c. a ton under No. 1 heavy melting.

Canada

Newfoundland Government Buys 11,000 Tons of Rails—100,000 Tons of Structural Work in Prospect

TORONTO, ONT., July 23.—While the Canadian pig iron markets are still affected by the summer holiday lull, more interest was manifest during the past week. No forward buying was reported, but spot demand was more active. The daily melt continues high, with many foundries operating at 100 per cent of capacity. Prices are strong in most districts, although they have been shaded in some instances on especially desirable business.

Prices per gross ton:

Delivered Toronto	
No. 1 fdy., sil. 2.25 to 2.75	$24.60
No. 2 fdy., sil. 1.75 to 2.25	24.10
Malleable	24.60
Delivered Montreal

Malleable	26.00
Basic	24.50
Imported Iron, Montreal Warehouse	
Summerlee	$33.50
Carron	33.00

Structural Steel. — Demand shows general improvement. Several large bridge contracts are expected to be placed soon. A number of new building projects have been announced for which from 100 to 8000 tons of steel will be required. It is estimated that prospective structural steel work in Ontario and Quebec totals 50,000 and 60,000 tons, while for other parts of the Dominion upward of 50,000 tons is in prospect.

Cast Iron Pipe.—Sewage and waterworks developments are resulting in a growing demand for pipe. At the same time there are large prospective requirements in both steel and cast pipe in connection with oil and gas operations in this country. The Greater Vancouver Water Board, Vancouver, B. C., has awarded a contract to the Vancouver Engineering Works,

519 West Sixth Avenue, to supply seven miles of steel pipe ranging in size from 26 to 36 in. in diameter, at a cost of $292,963. The City Council, Winnipeg, Man., has placed an order with the Canada Iron Foundries, Fort William, Ont., for 3600 ft. of 6-in. pipe, 3600 ft. of 10-in. pipe and 3600 ft. of 12-in. pipe.

Rails.—In addition to the substantial rail orders recently received by the Algoma Steel Corporation, Sault Ste. Marie, Ont., and the Dominion Iron & Steel Co., Sydney, N. S., the latter company has just received an order for 11,000 tons of rails from the New Foundland Government. Other large orders are said to be in consideration by both the Canadian National Railways and the Canadian Pacific Railway.

Old Material.—Business in this market has shown some improvement, in sympathy with the betterment in the general outlook of the iron and steel industry as a whole. A few good tonnage sales were reported in heavy melting steel and turnings in the Toronto district and inquiry is more active than for several weeks. Montreal interests continue to order steel scrap in small lots, but at frequent intervals. Prices are firm but unchanged.

Dealers' buying prices:

	Toronto	Montreal
	Per Gross Ton	
Heavy melting steel.	$10.00	$8.50
Rails, scrap	11.00	9.00
No. 1 wrought	10.00	12.00
Machine shop turnings	7.50	5.00
Boiler plate	7.50	6.00

Cast borings	7.50	5.00
Steel turnings	7.50	6.50
Wrought pipe	6.00	6.00
Steel axles	15.00	20.00
Axles, wrought iron	17.00	22.00
No. 1 machinery cast	....	17.00
Stove plate	....	13.00
Standard carwheels	....	16.00
Malleable	....	13.00
	Per Net Ton	
No. 1 mach'ry cast	$16.00	....
Stove plate	12.00	....
Standard carwheels	15.00	....
Malleable scrap	14.00	....

Coke.—Consumption of by-product foundry coke is running a little ahead of July, 1928, records, and just about on a par with June, this year. The price on New England made fuel remains unchanged at $11 a ton, delivered within a $3.10 freight rate zone. Last week 4000 tons of coke from the Ruhr district of Germany, loaded at Rotterdam, arrived at Providence, R. I., for the Providence Gas Co.

Old Material.—With mills specifying against contracts more freely, with competition among shippers growing, and with most kinds of scrap in limited supply, old material prices continue to have an upward trend. The market for No. 1 heavy melting steel, scrap rails, forge flashings and skeleton is stronger than that for other kinds of scrap. Bethlehem Steel Co.'s representatives are active in the unprepared scrap market. Material bought by them is being shipped direct to consuming point instead of from the company's Quincy, Mass., shipbuilding plant, as heretofore. Owing to the fact that 75 per cent of loading crane equipment is out of commission, making it possible to load not more than 100 tons per day, indications are local scrap exporters will withdraw from the market after this week until loading facilities have been replaced in commission. One steamer is expected to finish loading 3500 tons for Danzig this week. Another 1500 ton contract will probably be held up temporarily.

Buying prices per gross ton, f.o.b. Boston rate shipping points:

No. 1 heavy melting steel	$12.50 to $13.00
Scrap T rails	11.75 to 12.50
Scrap girder rails	10.50 to 11.50
No. 1 railroad wrought	12.00 to 12.50
No. 1 yard wrought	9.50 to 10.00
Machine shop turnings	6.60 to 7.10
Cast iron borings (steel works and rolling mill)	6.50 to 6.60
Bundled skeleton, long	9.50 to 10.50
Forge flashings	†0.25 to 10.75
Blast furnace borings and turnings	6.00 to 6.25
Forge scrap	9.00 to 9.25
Shafting	14.00 to 14.25
Steel car axles	18.00 to 19.00
Wrought pipe 1 in. in diameter (over 2 ft. long)	9.75 to 10.00
Rails for rolling	12.50 to 13.00
Cast iron borings, chemical	10.00 to 10.25

Prices per gross ton deliv'd consumers' yards:

Textile cast	$14.50 to $15.00
No. 1 machinery cast	15.00 to 15.25
No. 2 machinery cast	13.00 to 13.25
Stove plate	11.00 to 11.50
Railroad malleable	18.50 to 19.00

Boston

Pig Iron Sales Larger With Prices Showing No Strength—Scrap Values Advancing

BOSTON, July 23.—The purchase of 2000 tons by a Massachusetts valve manufacturer, 1500 tons by a Massachusetts textile machinery maker, 1000 tons by a Connecticut foundry and numerous small lots brought local pig iron sales the past week up to approximately 9000 tons, the largest total for some weeks. The valve manufacturer business was split three ways. The textile machinery business went largely to a furnace east of Buffalo, as did the 1000-ton Connecticut order. It is understood the textile manufacturer will purchase more iron this week, and there is a possibility of heater makers coming into the market shortly for several thousand tons, although they have not sent out inquiries. Irons sold the past week included Mystic, Buffalo, New York State, western Pennsylvania and Alabama. Prices are still soft, although no business at less than the equivalent of $17 a ton, base Buffalo, is reported. No. 1X iron, however, sold at the equivalent of $17.50 a ton, Buffalo, and a shade higher. Thus furnaces are not holding to 50c. differentials.

Foundry iron prices per gross ton deliv'd to most New England points:

†Buffalo, sil. 1.75 to 2.25	$21.28 to $21.78
†Buffalo, sil. 2.25 to 2.75	21.78 to 22.28
*Buffalo, sil. 1.75 to 2.25	21.91 to 22.41
*Buffalo, sil. 2.25 to 2.75	22.41 to 22.91
East. Penn., sil. 1.75 to 2.25	24.65
East. Penn., sil. 2.25 to 2.75	25.15
Va., sil. 1.75 to 2.25	25.21
Va., sil. 2.25 to 2.75	25.71
Ala., sil. 1.75 to 2.25	21.41 to 23.27
Ala., sil. 2.25 to 2.75	21.91 to 23.77

Freight rates: $4.91 all rail from Buffalo, and $4.28 rail and water; $3.65 from eastern Pennsylvania; $5.21 all rail from Virginia; $6.91 to $8.77 from Alabama.

*All rail rate.

†Rail and water rate.

Reinforcing Steel.—The market for reinforcing steel remains quiet. Sales of billet steel bars the past week aggregated just under 300 tons. Prices are firm at 2.66½c. a lb., base, from stock. Rail steel bars are 2.26½c., base, delivered common Boston freight rate points.

Cast Iron Pipe.—The Boston Consolidated Gas Co. will shortly close on its last quarter 6 to 24-in. pipe requirements, about 2000 tons in all. For estimating purposes, Holyoke, Mass., is asking bids on 1000 tons of 6 to 12-in. pipe. Massachusetts has purchased 350 tons of pipe for various State institutions, and Bedford, Mass., 100 tons of 6-in. stock. Prices quoted openly on domestic pipe are: 4 in., $46.10 to $47.10 a ton, delivered common Boston freight rate points; 6 to 12 in., $40.10 to $41.10; 16 to 20 in., $39.10. A $3 differential is asked on Class A and gas pipe.

Detroit Scrap Firmer

DETROIT, July 23.—There have been no changes in prices on waste material in the district during the past week and there is a decidedly firmer tendency on blast furnace grades, with prices near the high of the range. This is probably due to the fact that the production of scrap has decreased during the present month.

Dealers' buying prices per gross ton, f.o.b. cars, Detroit:

Hvy. melting and shov. steel	$14.00 to $14.50
Borings and short turnings	9.00 to 9.50
Long turnings	8.00 to 8.50
No. 1 machinery cast	12.50 to 13.00
Automobile cast	13.00 to 13.50
Hydraul. comp. sheets	13.75 to 14.25
Stove plate	9.00 to 9.50
New No. 1 busheling	12.50 to 13.00
Old No. 1 busheling	11.00 to 11.50
Sheet clippings	8.75 to 9.25
Flashings	12.75 to 13.25

Buffalo

Pig Iron Inquiries Total 20,000 Tons—One Is for Fourth Quarter—Scrap Scarce

BUFFALO, July 23.—Inquiries totaling 20,000 tons of pig iron have been received. This volume is partially accounted for by the fact that melters who have been operating steadily through the second quarter and thus far into the third quarter on iron purchased early in the year are now running short and must come into the market. Two inquiries from the East are for 3000 tons apiece and one is for 4000. There are several for 1000 tons and similar tonnages. An order placed in Buffalo from the East was for 1600 tons of malleable and foundry. The first fourth-quarter inquiry for 250 tons of foundry has been received. The movement over the canal has been very good. Production of iron in this district is at top notch and one maker reports the heaviest first-half shipments in the history of the company. Buffalo producers believe that furnaces east of here are pretty well sold up and are hopeful of a firm price being maintained along the seaboard.

Prices per gross ton, f.o.b. furnace:

No. 2 fdy., sil. 1.75 to 2.25	$19.50
No. 2X fdy., sil. 2.25 to 2.75	20.00
No. 1 fdy., sil. 2.75 to 3.25	21.00
Malleable, sil. up to 2.25	20.00
Basic	18.50
Lake Superior charcoal	27.28

Finished Iron and Steel.—Manufacturers of reinforcing bars and fabricated structural steel report a steady demand and plenty of inquiries for small size lots, but not many for sizeable tonnages. Bids will be received soon for a post office in connection with the New York Central Terminal in East Buffalo. This building will require 400 tons of structural steel. A water reservoir at Gowanda will require 150 tons of reinforcing bars. Operation of mills is being maintained and the demand shows no sign of tapering.

Old Material.—No. 1 heavy melting steel is unusually scarce and the market is stronger. There has been some purchasing at $17.25, but no large tonnages. There have been a few purchases of No. 1 machinery cast at $15.75 to $16, and an inquiry is out for 2000 tons of stove plate. This consumer wants to buy at about $12.50, but dealers believe the material cannot be had under $13. Railroad lists went to Pittsburgh at a price of $19, Buffalo. There is a strong demand from Weirton for No. 2 heavy melting steel, and dealers are offering $14.25 to $14.50 on old orders here. In one instance $14.75 was paid. Dealers are paying $10 for machine shop turnings on one order, but as the material is taken only on an analysis basis shipments are not being freely made. One small purchase of stove plate is reported at $13. Demand for specialties has picked up, but quite a number of unfilled orders are out and dealers are reluctant to take on new. There has been a decided drop in the production of scrap and demand has been maintained. A few sales of cast iron borings at $11.50 are reported. One of the largest consumers in the district continues to bring in hydraulic sheets from Detroit at the rate of two boatloads a week.

Sustained Industrial Output Forecast by Statisticians

"The past half year established a new high record in industrial production and trade in the United States, and the current rate should continue without serious let-up for some time to come," according to the July report of the Conference of Statisticians in Industry, operating under the auspices of the National Industrial Conference Board, New York. "This achievement is all the more remarkable because it was brought about in the face of extremely unfavorable money conditions, an unsettled agricultural situation, a decline in building construction and a depressed condition in the hide and leather industries."

The report emphasizes especially the favorable balance between production and consumption. "So far this year a very large industrial output has been absorbed by what seems to be an insatiable consumer demand. Commodity stocks on the whole have actually been on the decrease. In spite of the high tempo of production, costs have apparently remained stationary or declined, for net earnings have increased faster than gross income. No important signs of overproduction have as yet appeared."

Although the decline in building construction continues, it appears to be centered, according to the report, chiefly in the larger cities and has affected mainly residential building. The recovery of agricultural prices is pointed to by the report as likely to convert a hitherto unfavorable factor into a stabilizing influence for continued industrial prosperity.

More Steel Castings Made in Half-Year

WASHINGTON, July 23.—Orders for commercial steel castings in June totaled 94,559 tons, representing 65 per cent of the monthly capacity of 145,700 tons of the 127 concerns reporting to the Department of Commerce. This compares with 113,329 tons, or 78 per cent of capacity, for May. Production was 115,411 tons, or 79 per cent of capacity, against 127,189 tons or 87 per cent of capacity in May.

Of the June orders, 35,425 tons was for railroad specialties, being 52 per cent of that class of capacity and 59,134 tons was for miscellaneous castings, representing 76 per cent of such capacity. For the six months ended June, orders totaled 723,292 tons, or 83 per cent of capacity compared with 509,268 tons, or 58 per cent of capacity, for the corresponding period of last year.

June production was made up of 55,493 tons of railroad specialties, or 82 per cent of such capacity, and 59,918 tons of miscellaneous castings, or 77 per cent of such capacity. Production for the first six months of 1929 aggregated 670,685 tons, against 527,265 tons for the corresponding period of 1928. The gain in railroad specialties was much heavier than in the miscellaneous group. It was 43 per cent—from 204,841 tons to 293,120 tons—compared with 17 per cent—from 322,424 tons to 377,565 tons—for miscellaneous castings.

Exhibits of metal products will be shown at the Leipzig Trade Fair at Leipzig, Germany, Aug 25 to 31 inclusive. America's expanding world trade has been responsible for increased participation in the fairs during the past few years. Information concerning the fair can be obtained from American headquarters at 11 West Forty-Second Street, New York.

Non-Ferrous Metal Markets

Tin Sales Heavy, Copper More Active, Zinc Prices Advance

NEW YORK, July 23.

Tin.—The past week was marked by increased buying of Straits tin, total sales having amounted to about 2800 tons. This tonnage put the week among the highest of the year. Demand was about equally divided among dealers and consumers, and deliveries over the remainder of 1929 were specified by most customers. The market was quiet early in the week until a consumer bought 500 tons. This transaction gave impetus to further active trading, which has prevailed the last few days. While business has been of substantial volume, there have been no developments of outstanding interest. The demand for Straits tin is reflected in prices. Quotations have remained fairly steady all week and spot Straits tin was firm today at 47.25c., New York. The London market has been moderately active and prices have not changed much in the past week. Spot standard is quoted at £212 10s., future standard at £216 5s. and spot Straits at £216 5s. An interesting feature is that full prices were paid in the primary market at Singapore, which was quoted today at £220 10s.

Copper.—An upward turn in demand was discernible the past week and indications are that buying on a more liberal scale will continue during the remainder of July. Sales this morning totaled about 1200 tons and average daily bookings in the last seven days have been more than 1100 tons, or twice those of the preceding week. Practically all of the gain has been confined to foreign users, for domestic consumers still are refraining from buying, except in extremely meager lots. Producers, however, are confident that the time is rapidly drawing near when domestic companies will be forced into the market from the sheer necessity of meeting immediate needs. Although the increased sales have bolstered the market, it must be remembered that demand still is far below normal. Producers must book about 2000 tons daily in order to find an outlet for normal accumulation of stocks. It is evident, therefore, that business during July has been far from satisfactory, even though the month is ending more satisfactorily than it began. Prices are firm and unchanged, with

THE WEEK'S PRICES. CENTS PER POUND FOR EARLY DELIVERY

	July 23	July 22	July 20	July 19	July 18	July 17

List Prices, Per Lb., f.o.b. Mill

On Copper and Brass Products, Freight up to 75c. per 100 Lb. Allowed on Shipments of 500 Lb. or Over

Sheets—
- High brass ..... 23.25c.
- Copper, hot rolled ..... 26.75c.
- Zinc ..... 10.25c.
- Lead (full sheets) ... 11.00c. to 11.25c.

Seamless Tubes—
- High brass ..... 28.25c.
- Copper ..... 29.25c.

Rods—
- High brass ..... 21.25c.
- Naval brass ..... 24.00c.

Wire—
- Copper ..... 19.87½c.
- High brass ..... 23.75c.

Copper in Rolls ..... 26.75c.
Brazed Brass Tubing ..... 30.87½c.

Aluminum Products in Ton Lots

The carload freight rate is allowed to destinations east of Mississippi River and also to St. Louis on shipments to points west of that river.

Sheets, 0 to 10 gage, 3 to 30 in. wide ..... 33.00c.
Tubes, base ..... 42.00c.
Machine rods ..... 34.00c.

Chicago Warehouse

(Prices Cover Trucking to Customers' Doors in City Limits)

Sheets—	Base per Lb.
High brass	23.25c.
Copper, hot rolled	27.75c.
Copper, cold rolled, 14 oz. and heavier	30.00c.
Zinc	10.00c.
Lead, wide	11.90c.
Seamless Tubes—	
Brass	28.25c.
Copper	29.25c.
Brass Rods	21.25c.
Brazed Brass Tubes	31.00c.

New York or Cleveland Warehouse

Delivered Prices, Base Per Lb.

Zinc sheets (No. 9), casks	10.50c.	to 11.00c.
Zinc sheets, open	11.50c.	to 12.00c.

Metals from New York Warehouse

Delivered Prices, Per Lb.

Tin, Straits pig	48.50c. to 49.50c.
Tin, bar	50.50c. to 51.50c.
Copper, Lake	19.50c.
Copper, electrolytic	19.25c.
Copper, casting	19.00c.
Zinc, slab	7.75c. to 8.25c.
Lead, American pig	7.50c. to 8.00c.
Lead, bar	9.50c. to 10.00c.
Antimony, Asiatic	10.50c. to 11.00c.
Aluminum No. 1 ingots for remelting (guaranteed over 99% pure)	25.00c. to 26.00c.
Alum. ingots, No. 12 alloy,	24.00c. to 25.00c.
Babbitt metal, commercial grade,	30.00c. to 40.00c.
Solder, ½ and ⅓	31.00c. to 32.00c.

Metals from Cleveland Warehouse

Delivered Prices Per Lb.

Tin, Straits pig	52.00c
Tin, bar	54.00c.
Copper, Lake	19.50c.
Copper, electrolytic	19.25c.
Copper, casting	18.75c.
Zinc, slab	7.75c. to 8.00c.
Lead, American pig	7.50c. to 7.75c.
Lead, bar	9.75c.
Antimony, Asiatic	16.00c.
Babbitt metal, medium grade	18.75c.
Babbitt metal, high grade	56.50c.
Solder, ½ and ½	31.75c.

Old Metals, Per Lb., New York

Buying prices represent what large dealers are paying for miscellaneous lots from smaller accumulators and selling prices are those charged customers after the metal has been properly prepared for their uses.

	Dealers' Buying Prices	Dealers' Selling Prices
Copper, hvy. crucible	14.50c.	16.00c.
Copper, hvy. and wire	14.25c.	15.75c.
Copper, light and bottoms	12.50c.	13.50c.
Brass, heavy	8.50c.	9.50c.
Brass, light	7.50c.	8.50c.
Hvy. machine composition	11.50c.	12.75c.
No. 1 yel. brass turnings	9.50c.	10.25c.
No. 1 red brass or compos. turnings	11.25c.	12.25c.
Lead, heavy	5.25c.	5.75c
Lead, tea	4.25c.	5.25c.
Zinc	3.50c.	4.25c.
Sheet aluminum	14.00c.	16.00c.
Cast aluminum	12.25c.	14.25c.

electrolytic copper quoted at 18c., delivered in the Connecticut Valley, and at 18.30c., c.i.f. usual European ports. Lake copper is steady at 18c. to 18.12½c., delivered.

Zinc.—At the beginning of the week producers sold considerable tonnages of prime Western zinc at 6.70c., East St. Louis, and then raised the price to 6.80c. All sellers are now quoting on the latter basis. The bulk of the week's business, of course, was done prior to the advance, and therefore sales the past few days have been somewhat light.

Lead.—Considerable buying was reported the past week, with total sales in the United States approximating 12,000 tons. During the middle of the week there was a slight drop in quotations to 6.52½c., St. Louis, but later the market recovered its strength and producers are now holding to 6.55c. The American Smelting & Refining Co. is asking 6.75c., New York.

Antimony.—The crisis in Chino-Russian relations which developed the past week precipitated a rush of consumer buying of Chinese metal. The result has been a general firming up of prices, with spot selling at 8.75c. and futures at 8.62½c., duty paid, New York.

Nickel.—Ingot nickel is selling at 35c. a lb., shot nickel at 36c. and cathodes of electrolytic nickel at 35c.

Aluminum.—Virgin metal, 98 to 99 per cent pure, is priced at 23.90c. a lb., delivered.

Non-Ferrous Metals at Chicago

CHICAGO, July 23.—Prices have advanced on all metals except copper and lead. Sales are in fair volume and releases against old orders are liberal. The old metal market is steady and moderately active.

Prices per lb., in carload lots: Lake copper, 18.50c.; tin, 48c.; lead, 6.65c.; zinc, 6.90c.; in less-than-carload lots, antimony, 9.62½c. On old metals we quote copper wire, crucible shapes and copper clips, 14c.; copper bottoms, 11.50c.; red brass, 11.50c.; yellow brass, 8c.; lead pipe, 4.50c.; zinc, 3.25c.; pewter, No. 1, 24.50c.; tin foil, 26c.; block tin, 36c.; aluminum, 12.87½c.; all being dealers' prices for less-than-carload lots.

New Trade Publications

Wrought Iron—Mesker Brothers Iron Co., St. Louis. Treatise on wrought iron, describing metal sash of this material and the reasons why it is immune to progressive corrosion. Wrought iron sash made by this company may be had in center-pivoted or projected types. The sections are exceptionally heavy, being 1½ in. deep and weighing more than 1 lb. a foot.

Valves.—Homestead Valve Mfg. Co., Coraopolis, Pa. Catalog of 52 pages, identified as catalog No. 35, contains information and illustrations of various types of valves manufactured by the company. Features shown for the first time are 8-in. and 10-in. straight-way valves, 12-in. three-way valves and a special two-way protected seat hydraulic operating valve, which may be used as a spray valve or as a tube tester relief valve. To illustrate the company's ability to handle special engineering and industrial requirements, a complicated type of cast steel valve designed to meet unusual pressure and temperature requirements is shown.

Unit Heater.—Young Radiator Co., Racine, Wis. The Young unit heater in a recirculating box is described in a four-page circular. This is a particularly interesting development for automobile factories, garages, warehouses and machine shops.

Furnace Construction.—Standard Arch Co., Frostburg, Md. Booklet of 20 pages illustrating and describing an arch suspended roof, flat suspended roof and sectional supported sidewall construction for furnaces of either the industrial or the boiler type, and for a wide variety of fuels. Methods of installation and repair are detailed.

Refractories.—Charles Taylor Sons Co., Cincinnati. Booklet of four pages describing Tayco X refractories for special furnace requirements. Strength at high temperatures is stressed.

Ball Bearings.—New Departure Mfg. Co., Bristol, Conn. Loose-leaf pages of engineering reference book, general industrial edition. These cover 26 pages with an index and introduction. They are illustrated. A considerable amount of tabular matter is included.

Piling Case Goods.—Revolvator Co., 352 Garfield Avenue, Jersey City. Bulletin 85A, illustrated, shows the use of portable stacking elevators for putting boxes of goods into storage and taking them out again.

Locomotive Cranes.—Link-Belt Co., 910 South Michigan Avenue, Chicago. Booklet of 48 pages describing cranes, shovels and drag lines operated by electric motor or by steam, gasoline or Diesel engines. Capacities are from ¾ yd. to 2 yd. Crawler cranes and shovels are featured.

Water-Level Indicator.—Combustion Engineering Co., 200 Madison Avenue, New York. Folder of four pages illustrating and describing a water-level indicator for boilers, which is easily readable from the floor, regardless of the height of the boiler.

Floodlight.—Crouse-Hinds Co., Syracuse, N. Y. Bulletin 2134 of four pages illustrates and describes a floodlight for universal service, either industrial or otherwise.

Silent Chain Drives.—Ramsey Chain Co., Albany, N. Y. Catalog of 88 pages, profusely illustrated, describing a line of chain drives for application to all types of machinery. The illustrations are largely drawn from widespread installations. Tabular matter gives dimensions and list prices for a considerable variety of equipment.

Mechanical Stokers.—American Engineering Co., Philadelphia. Pamphlet of 16 pages illustrating and describing Taylor stokers, with particular reference to units going into the Delray No. 3 station of the Detroit Edison Co.

Motor-Generator Set.—General Electric Co., Schenectady, N. Y. Bulletin GEA-394A covers in two pages a small induction motor-generator set obtainable in sizes from ⅞ kw. to 35 kw. and giving 125 or 250-volt direct current.

Reinforcing Steel

Lettings Total 5500 Tons And Inquiries Are Light

REINFORCING steel lettings the past week totaled only 5500 tons, consisting mostly of miscellaneous jobs ranging from 100 to 300 tons. Inquiries for about 1800 tons were among the smallest of the year. They included 700 tons for a plant at Tarrytown, N. Y., for the Chevrolet Motor Co.

SAYREVILLE, N. J., 200 tons, Eastern New Jersey Power Co., to Truscon Steel Co.

COATESVILLE, PA., 475 tons, Coatesville General Hospital, to Truscon Steel Co.

CINCINNATI, 200 tons, sewer construction, to West Virginia Rail Co.

GRAND RAPIDS, MICH., 800 tons, sewage treating plant, to an unnamed bidder.

GRAND TRUNK RAILROAD, 500 tons, grade separation work at Pontiac, Mich., to Jones & Laughlin Steel Corporation.

DES MOINES, IOWA, 300 tons, Montgomery Ward Co., to Sheffield Steel Corporation.

PHOENIX, ARIZ., 168 tons, paving Douglas-Rodeo Highway, to unnamed bidder.

SAN FRANCISCO, 277 tons, factory, Howard and Montgomery Streets, to Pacific Coast Steel Co.

SAN FRANCISCO, 287 tons, factory, Yosemite and Lane Streets, to Pacific Coast Steel Co.

SAN FRANCISCO, 370 tons, apartment building, O'Farrell and Leavenworth Streets, to W. C. Hauck & Co.

SAN FRANCISCO, 675 tons, school, Twenty-ninth and Geary Streets, to Pacific Coast Steel Co.

HAYWARD, CAL., 150 tons, warehouse for California Conserving Co., to Pacific Coast Steel Co.

BERKELEY, CAL., 500 tons, Giannini Hall, University of California, to Soule Steel Co.

BERKELEY, 300 tons, dormitory, Bancroft and Piedmont Avenue, to Soule Steel Co.

SANDPOINT, WASH., 150 tons, barracks, to Northwest Steel Rolling Mills.

OLYMPIA, WASH., 250 tons, highway work, to Northwest Steel Rolling Mills.

OLYMPIA, 200 tons, highway work, to Pacific Coast Steel Co.

PORTLAND, ORE., 100 tons, highway work, to Northwest Steel Rolling Mills.

Reinforcing Bars Pending

Inquiries for reinforcing steel bars include the following:

TARRYTOWN, N. Y., 700 tons, plant addition for Chevrolet Motor Co.

GOWANDA, N. Y., 150 tons, water reservoir for village.

PHILADELPHIA, 1000 tons, Ridge Avenue subway; Keystone State Construction Co., low bidder for general contract.

CLEVELAND, 300 tons, clothing factory for Richman Brothers.

CHICAGO, tonnage not stated, Gateway theater; Rapp & Rapp, architects.

TACOMA, WASH., 290 tons, cold storage plant; bids being taken.

SAN FRANCISCO, 300 tons, Shell Oil Building; bids being taken.

American Hoist & Derrick Co., St. Paul, Minn., manufacturer of hoisting machinery, has removed its San Francisco office to 5515 Doyle Ave., Emeryville, Oakland, Cal. Boyd Nixon continues in charge.

PERSONAL

HAROLD W. SCHROEDER has been appointed district sales manager at New York for the Wheeling Steel Corporation, succeeding C. E. Scofield, who died July 9. Mr. Schroeder was born in Montclair, N. J., in 1894 and was graduated from Harvard University in 1915 with the bachelor of science

H. W. SCHROEDER

degree. He worked for several years in the Steubenville, Ohio, mill of the LaBelle Iron Works, and in July, 1919, became associated with the New York sales office of that company. When the LaBelle company merged with the Wheeling Steel Corporation in 1921, Mr. Schroeder continued in the New York office of the consolidated companies, in 1925 being appointed manager of the export department. In 1927 he added to his work the duties of assistant manager of sales for the New York district. In conjunction with his activities as district sales manager he will continue as manager of the export department, in which capacity he has charge of all of the company's foreign sales.

—

HARRY A. BLACK, president, Black Hardware Co., Galveston, Tex.; HAROLD C. SMITH, president, Illinois Tool Works, Chicago; FREDERICK M. FEIKER, managing director, Associated Business Papers, Inc., New York, and ALFRED REEVES, general manager, National Automobile Chamber of Commerce, New York, are members of a committee of the Chamber of Commerce of the United States to assist trade groups in relation to trade association activities.

—

F. A. WEYMOUTH, for a number of years engineer of tests of the former Maryland Steel Co., Sparrows Point, Md., and later sales metallurgist, Bethlehem Steel Co., has been appointed chief metallurgist of the Colorado Fuel & Iron Co., Pueblo, Colo.

HAROLD S. FALK, vice-president and works manager of the Falk Corporation, Milwaukee, has been appointed chairman of the committee on industrial education of the National Metal Trades Association. During the last seven years he has been chairman of the apprenticeship committee of the Milwaukee branch of the National Metal Trades Association and under his direction the number of apprentices in the Milwaukee district has grown from 460 to well over 1000. Mr. Falk is also a member of the committee on education and training for industries of the American Society of Mechanical Engineers.

—

ADOLFO PRIETO, president, Monterey Iron & Steel Co., Monterey, Mexico, sailed from New York July 19 on the Alfonso XIII for Spain. He spent several days in New York as the guest of WILLIAM G. MOLER, New York representative of the Monterey company. Mr. Prieto was also entertained by the Mexican Chamber of Commerce of the United States in New York. He is president of La Victoria, one of the largest cotton and woolen mills in Mexico, and is director of industrial, financial and commercial institutions, including the Bank of Mexico.

—

J. C. WILLIAMS, vice-president and general manager, Weirton Steel Co., Weirton, W. Va., sailed on July 15 for a six-weeks vacation in Europe.

—

W. K. STAMETS, Pittsburgh machinery dealer, is returning this week from a three-months tour of Europe.

—

J. S. ELVERSON, who for more than 25 years has specialized in chilled iron casting work, has been honored by the Fuller Lehigh Co., Fullerton, Pa., which has adopted the trade name Elverite as a designation for its chilled iron products. Mr. Elverson is the Fuller Lehigh Co.'s metallurgist. After his graduation from the University of Pennsylvania in 1887, he worked for a number of years in ore surveys, was ore agent for the Crane Iron Works, and later president of the Catasauqua Mfg. Co., manager of the Oxford mines and furnaces of Empire Steel & Iron Co. and president of the Lehigh Foundry Co.

—

E. A. WEAVER, heretofore district manager of the Boston office of the Surface Combustion Co., has been transferred to the home office at Toledo. He will be succeeded by JOHN R. WALTMAN.

—

E. P. DILLON, since 1918 general manager of the Research Corporation of New York, has been appointed vice-president and associate engineer of the E. Y. Sayer Engineering Corporation, New York. He has been engaged in power plant design and construction work since his graduation from the University of Colorado in 1899.

—

WALTER M. SUTTON, formerly in charge of the St. Louis office of the W. A. Jones Foundry & Machine Co., Chicago, has been appointed manager of the Pittsburgh office of the company.

—

BENJAMIN DIXON, who has been sales manager of the Industrial Works of Bay City, Mich., has become district sales manager of the Detroit and Chicago offices of the Ohio Locomotive Crane Co., Bucyrus, Ohio. He will make his headquarters in Detroit.

—

E. G. CRAIG has been placed in charge of the New York office, 342 Madison Avenue, of the Hevi Duty Electric Co., Milwaukee.

—

THOMAS L. THOMAS, formerly vice-president of the McKay Machine Co., Youngstown, Ohio, will take an executive position with the Wean Engineering Co., Inc., Warren, Ohio, which recently arranged to handle sales exclusively for the iron and steel industry for the McKay Machine Co.'s roller leveling equipment.

—

H. S. RAWDON has taken up his duties as chief of the division of metallurgy, Bureau of Standards, Washington, succeeding Dr. H. W. GILLETT, who resigned to become director of the Battelle Memorial Institute, Columbus, Ohio. Mr. Rawdon has been in charge of the section of optical metallurgy at the Bureau of Standards.

—

C. W. NIXON, formerly assistant to the general manager of the Central Foundry Co., Holt, Ala., has been named manager of operations of the southern plants of the company, with headquarters at Bessemer.

—

E. K. MILLER has resigned as superintendent of the Fairfield blast furnaces of the Tennessee Coal, Iron & Railroad Co. He has been succeeded by G. M. HARRIS, formerly assistant superintendent.

—

WILMER C. HANSON, who was formerly vice-president of W. Tyrie Stevens, Inc., New York, has opened his own office at 30 Church Street, New York, as export manager, specializing in engineering and construction machinery and equipment.

—

JESSE GURNEY VINCENT, vice-president of engineering, Packard Motor Car Co., received the honorary degree of master of engineering from the University of Michigan at the commencement exercises on June 17.

—

RAY C. CROUCH, mechanical engineer, Riter-Conley Mfg. Co., Pitts-

burgh, has become works manager of Reeves Brothers Co., Birmingham.

—

JOHN A. ROSS, JR., professor of mechanical engineering, Clarkson College of Technology, Potsdam, N. Y., has been appointed to the newly created position of dean of administration.

—

E. J. SCHWANHAUSSER, assistant manager of the Harrison works, Worthington Pump & Machinery Corporation, is taking a combined business and pleasure trip through Europe.

—

ROBERT K. PLUMMER, who has been in charge of the Indianapolis office of Gears & Forgings, Inc., Cleveland, has been made assistant sales manager of the company. GEORGE W. DAVIS, formerly of the Chicago office, has been transferred to Indianapolis as district manager.

Ohio Foundrymen To Take Boat Trip

If a sufficient number of advance reservations are received, the Ohio Foundries Association, Penton Building, Cleveland, will hold its 1929 convention on an Ohio River boat. The plan is to leave from Cincinnati shortly after Sept. 15 for a trip to Ashland Ky., and return. The cost of the trip will be $30 a person. Arrangements will be made to visit a plant during the stop at Ashland.

Obituary

JOHN S. TURNER, since 1904 a member of the sales organization of the Pressed Steel Car Co., died on July 15 at his home in Brooklyn, aged 70 years. He spent about 25 years in the employ of various railroads. In 1901 he entered the sales department of the Standard Coupler Co., and a few years later joined the New York sales organization of the Pressed Steel Car Co.

—

HARRIS BOTWINIK, president, Botwinik Brothers, Inc., New Haven, Conn., died July 12.

—

THOMAS E. MURRAY, for years a vice-president of the New York Edison Co. and head of an engineering firm of his own name, an inventor of note largely in the electrical field and a man identified particularly with the engineering of central station power plants, died of heart disease at his home at Wickapogue, L. I., July 21, aged 68 years.

Examinations are to be held by the Civil Service Commission for associate and assistant metallurgists. The entering salaries are, respectively, $3,200 and $2,600 a year. Applications will close Aug. 28. Full information may be obtained from the commission, at Washington, or at the post office or custom house in any city.

Non-ferrous Meetings for Metal Congress Week

The Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers has announced papers to be presented during its annual fall meeting at Cleveland in the week of Sept. 9 during the National Metal Congress. Simultaneously with this meeting of the Institute of Metals will be presented programs by four other national technical societies, including the American Society for Steel Treating, the American Welding Society and the iron and steel divisions of the American Institute of Mining and Metallurgical Engineering and the American Society of Mechanical Engineers.

The papers to be presented include:

Metallography of Commercial Thorium, by E. S. Davenport, Westinghouse Lamp Works, Bloomfield, N. J.

The System Cadmium-Mercury, by Robert F. Mehl and Charles S. Barrett, Naval Research Laboratory, Anacostia, D. C.

Crystal Structure of the Alpha Copper-Tin Alloys, by Robert F. Mehl and Charles S. Barrett.

Cold Working of Metals, by R. L. Templin, Aluminum Co. of America, New Kensington, Pa.

Eutectic Composition of Copper and Tin, by G. O. Hiers and G. P. deForest, National Lead Co., Research Laboratory, Brooklyn, N. Y.

Effect of Alloying on the Permissible Fiber Stress in Corrugated Zinc Roofing, by E. A. Anderson, New Jersey Zinc Co., Palmerton, Pa.

Determining the Orientation of the Crystal in Rolled Metal from X-Ray Patterns Taken by the Monochromatic Pinhole Method, by Wheeler P. Davey, C. C. Nitchie and M. L. Fuller, New Jersey Zinc Co., Palmerton, Pa.

Metal Recoveries in Secondary Aluminum Practice, by Dr. R. J. Anderson, Fairmont Mfg. Co., Fairmont, W. Va.

Reclaiming Non-Ferrous Scrap Metals at Metal Manufacturing Industries, by Francis N. Flynn, Milwaukee.

Manufacture of Wire Bars from Secondary Copper, by W. A. Scheuch and J. Walter Scott, Western Electric Co., Hawthorne Station, Chicago.

Secondary Bronze, by H. M. St. John, Detroit Lubricator Co., Detroit.

Battery Lead, by F. F. Colcord, U. S. S. Lead Refinery, New York.

Reclaiming White Metal Waste, by Mr. Potter, Federal Mogul Corporation.

Cuppy Wire, by Mr. Remmers, Western Electric Co., Hawthorne Station, Chicago.

Scrapped 1700 Machines in Rebuilding Business

"When we put our house in order, business came back," says Col. F. H. Payne, President Greenfield Tap & Die Corporation, Greenfield, Mass., in an article in the July issue of the Executives Service Bulletin, published by the Metropolitan Life Insurance Co., New York. Colonel Payne says in this article that when the break in business came in the fall of 1920 the Greenfield Tap & Die Corporation decided to revamp its entire plant. Since that time more than 1700 machines of various types have been scrapped and about $2,000,000 has been spent on new buildings and equipment.

"We were facing a period of lean business some years ago," says Colonel Payne. "That spurred us on —made us go in for a costly program of reconstruction. The results have shown that we were right. It pays to go at a job of house cleaning as thoroughly as possible and there is never an end to it because American initiative never stands still. We did not miss the 1700 machines that we threw away when we saw that our real job was ahead of us."

June Sheet Production Far Below May

Production and shipments of steel sheets by independent makers in June dropped sharply from the high record of May, according to the monthly report of the National Association of Flat Rolled Steel Manufacturers. Production amounted to 337,841 net tons, compared with 393,430 tons during May. Shipments were 347,989 tons, compared with 392,336 tons in the previous month.

Sales, which amounted to 307,911 tons, showed a good gain over the 279,783 tons of May, which was more than 100,000 tons below April. With smaller shipments and heavier sales, the unfilled tonnage declined much less sharply, as sales were within about 40,000 tons of shipments. The mills still had a large tonnage of unfilled orders on their books July 1. The June report and comparisons, in net tons, follow:

	June	May	April
Total number of mills	722	722	722
Capacity per month	451,125	502,600	482,000
Percentage reporting	67.8	67.6	67.6
Sales	307,911	279,783	398,206
Production	337,841	393,430	375,256
Shipments	347,989	392,336	377,274
Unfilled orders	676,568	713,568	835,801
Unshipped orders	111,333	119,535	121,164
Unsold stocks	52,274	48,334	54,142
Percentages of Capacity			
Sales	100.6	82.4	122.3
Production	110.4	115.8	115.2
Shipments	113.7	115.5	115.9
Unfilled orders	221.1	210.1	256.8
Unshipped orders	36.4	35.2	37.2
Unsold stocks	17.1	14.2	16.6

Manganese Producers Meet in September

The annual convention of the American Manganese Producers Association will be held at the Mayflower Hotel, Washington, Sept. 9 and 10. A review of the industry will be presented. All persons interested in the development of domestic manganese are expected to be present. Harold A. Pumpelly, Metropolitan Bank Building, Washington, is secretary of the association. Richard H. Brown is chairman of the board of directors, J. Carson Adkerson, is president and John H. Cole, first vice-president.

Quiet Prevails in European Markets

Hot Weather and Holiday Season Exert Retarding Influence—Swedish Ore More Active—May Establish Thin-Sheet Cartel

(*By Cable*)

LONDON, ENGLAND, July 22.

INCREASING costs of iron ore and fuel are stiffening Cleveland pig iron prices and consumers are hastening to place their last quarter requirements. Deliveries earlier than September are obtainable only in small lots from merchants at more than market prices. Pig iron activity is consequently greater than is usual in the summer months.

Hematite iron is moving freely and prices are tending upward. Steel business is quiet as Scottish plants have closed for the holidays and English plants are preparing for vacations. Most Northeast Coast works are well occupied and plate mills are in a better position.

Japan is purchasing moderately, but Chinese demand has been hindered by the political situation in Manchuria.

Tin plate inquiry is good, but business is still restricted and mills are closing down at intervals under the restriction of output plan. Production is further curtailed by the hot weather. It is expected that the July production quota will be further reduced, which will entail more mills stopping. Consequently prices are considered more likely to be advanced in the near future.

Galvanized sheets are quiet but Indian reports are more optimistic and buying is expected to develop before long. Japan is buying a few small tonnages of light-gage black sheets.

Redpath, Brown & Co., Ltd., Edinburgh, have secured a £250,000 ($1,212,500) contract for the steelwork in the new Ford Motor Co. plant at Dagenham.

Continental markets are weak as a result of the general absence of large orders and increasing activity of mills seeking to replace contracts which are expiring. Prices of semi-finished material and merchant bars are especially easy, but plates and shapes are steady.

Collapse of the International Hoop Cartel has caused disorganization of prices, which are now about £6 to £6 2s. 6d. per ton, base (1.30c. to 1.32c. per lb.).

Swedish Company Mining Chrome Ore in Turkey

HAMBURG, GERMANY, July 3.—Seeking a source of chrome ore supply other than from the South Rhodesian Chrome Ore Mining Co., Swedish steel companies, including the Forsbacka Jernverks A. B. at Forsbacka, Avesta Jernverks A. B. at Avesta and the Fagersta Bruks A. B. at Fagersta, have formed a company with headquarters at Stockholm, Sweden, which has obtained a concession from the Turkish Government for mining chrome ore. The deposits, which are near Angora, are reported to be rich and a small tonnage has been shipped to Sweden. It is believed in some quarters that by 1931 the new mines will be able to supply an important tonnage to European consumers and some ore may be available for shipment to the United States.

May Form Continental Thin-Sheet Cartel

HAMBURG, GERMANY, July 8.—Establishment of the French Black Sheet Comptoir has not yet affected the market, but French prices are higher than formerly, and there has been a general slackening of demand. The German sheet market showed no upward tendency of prices after formation of the French comptoir or the German Feinblechkontor. The German association controls only about 50 per cent of the German sheet production.

Since formation of the Feinblechkontor, it is reported that Continental mills rolling thin-gage sheets, No. 28 and 30 gage, such as are bought by the Japanese market, are considering establishment of a separate syndicate and have approached British and American sellers with a view to formation of an international cartel or loose agreement covering these thin gages. Most of these mills in Germany are in the present Feinblech-

British and Continental European Export prices per gross ton, f.o.b. United Kingdom Ports, Hamburg and Antwerp, with the £ at $4.85

*Open-hearth steel, 10s. ($2.42) per ton extra.

kontor, but that association states that it has no intention at present of participating in an international sheet agreement.

Columeta in Luxemburg and the Paris sales offices of the Luxemburg mills have advanced their prices on black sheets and are now quoting on a level with British mills, which are leading at present in sheet exports to Japan. The present price is £12 10s. ($60.62) per ton, f.o.b. Antwerp, with the possibility of a concession of 1s. 6d. (36c.) per ton on large orders. This is also the price quoted in Germany, so that, although there is no cartel or agreement in force at present, prices are uniform, an unusual situation for any commodity in the Continental steel market.

Sweden Increasing Iron Ore Exports

STOCKHOLM, SWEDEN, July 6.—Producers of iron ore, including the Grangesberg Corporation, have informed Continental consumers that exports of iron ore in the first half of this year totaled 4,153,000 tons, and it is planned to export 9,000,000 tons in 1930 and about 9,500,000 tons in 1931. The schedule of next year's exports of iron ore includes estimated shipments of 6,000,000 tons by the Kiruna-Narvik mines, 200,000 tons by the Kiruna-Luleo mines, 2,250,000 tons by the Malmberget-Luleo mines and 500,000 tons by others. Of the total shipments of ore in the first half of this year about 90 per cent went to German consumers.

Germany Replacing Copper Wire with Aluminum

HAMBURG, GERMANY, July 8.—Aluminum wire is now being used extensively by the German telephone and telegraph department and in other Continental countries for overland lines. In Great Britain, especially, there is an increasing use of aluminum wire for transmission purposes. Copper products manufacturers in Germany claim that they have lost more customers in the past year than at any previous time, and that their business has declined to such a degree that their requirements are being covered by the present small orders and it will be unnecessary to buy more heavily in the future unless consumers using other metals return to the use of copper.

German Non-Ferrous Exports Up

HAMBURG, GERMANY, July 8.—German exports of semi-finished nonferrous products for the first five months of this year were 39,108 tons, compared with 31,983 tons in the same period of 1928. This is the largest total of exports that has been reached. Brass and copper semi-finished products constituted 89.7 per cent of the total.

German Scrap Quiet After Heavy Buying Movement

HAMBURG, GERMANY, July 8.—Iron and steel scrap is quieter following the recent heavy demand and upward movement of prices, which began in May. The Vereinigte Stahlwerk A. G., Düsseldorf, has succeeded in covering its heavy melting steel requirements for the rest of this year on contracts at about 67 m. ($15.96) per metric ton, delivered to the works, but other consumers paid higher prices. Buying has declined since the middle of June and prices are easier, but stocks of scrap in Germany are small and exports have been reduced to a few small tonnages.

Joint Sales Company Formed by German Motor Builders

HAMBURG, GERMANY, July 8.—The Junkerswerke, Dessau, and the Berlin-Tegel locomotive and motor works have formed a sales company under the name Vereinigte Deutsche Industriewerke Junkers-Borsig-Hall, with headquarters in Berlin. The company will establish sales agencies in the Near East, the first offices opened probably being in Egypt, Palestine, the Sudan and Cyprus. It will handle the sales of complete pumping stations and Diesel engines. Eventually the company will also operate agencies in the Far Eastern markets.

Japan Inquires for Rails—Buys Welsh Tin Plate

NEW YORK, July 22.—Export to the Far East is still rather small. The Nippon Oil Co. in Japan recently closed on about 25,000 base boxes of tin plate with Welsh mills, the second successive order from this company to go to British makers. Tokio municipality is opening bids on about 3000 tons of grooved rails. Japanese consumers of billets and sheet bars have not inquired for some months, following an active period of buying last fall and early this spring. Chinese merchants are inquiring for wire shorts, tin plate waste waste, bar crop ends and plate cuttings, but in most instances are unwilling to pay the prices quoted by American sellers of such material.

Russian Machinery Buying Has Increased

The Soviet Union purchased industrial machinery valued at $18,000,000 from American manufacturers in the first nine months of the current Soviet fiscal year, beginning Oct. 1, 1928, states the Amtorg Trading Co. Adding the value of tractors ordered recently, the total for slightly more than nine months is about $40,000,000. Purchases for the entire fiscal year 1927-1928 amounted to $33,000,000. In addition to transactions for immediate delivery, the Amtorg company has contracted for industrial and agricultural machinery aggregating $75,000,000 to be delivered in the next few years.

Not Many Locomotives Need Repairs

Fewer locomotives were in need of repair on the Class I railroads of the United States on July 1 than at any time since the railroads began the compilation of these reports in 1920. They totaled 7453, or 13 per cent of the number on line, according to the American Railway Association. This was a reduction of 350 locomotives or 4.5 per cent compared with the best previous record, established on June 1, 1929, at which time there were 7803 locomotives, or 13.6 per cent, awaiting repairs.

Class I railroads on July 8 had 204,308 surplus freight cars in good repair and immediately available for service. This was a reduction of 13,349 cars compared with June 30, at which time there were 217,657 cars.

Engineers to Discuss Industrial Trend

"Trends in Industry" will be the major theme of the sixteenth national convention of the Society of Industrial Engineers, to be held at the Hotel Statler, Cleveland, Oct. 23, 24 and 25.

Sessions will be held each morning and evening and plant inspection trips are planned for each afternoon. George C. Dent, 205 West Wacker Drive, Chicago, is executive secretary of the society.

Canadian Steel Output for Half Year Shows Gain

Canadian production of steel ingots and direct steel castings during June dropped to 119,505 gross tons from 126,372 tons in the previous month, but was slightly higher than the 116,530 tons reported for June last year. Compared with figures for May, the output in June showed a decline in steel ingots to 113,341 tons from 120,015 tons in May, while the output of steel castings showed little change at 6164 tons from 6357 tons in the previous month.

For the six months ended with June 30 the production of steel ingots and direct steel castings amounted to 738,842 gross tons, or an increase of 14 per cent over the 648,338 tons made during the corresponding six months of last year, and was 52 per cent greater than the 487,310 tons produced in the first half of 1927. This year's output to the end of June included 703,600 tons of ingots and 35,242 tons of direct steel castings.

Service Steel Co., Detroit, has opened a warehouse in Buffalo, where a stock of seamless steel tubing will be carried.

Steel Companies' Profits Rise Sharply

Youngstown Sheet & Tube Co.'s Gain About 38 Per Cent in Second Quarter Over First—Republic Iron & Steel Co. Also Makes Substantial Gain

STEEL companies' profits rose sharply in the second quarter of the year. Only a few companies have so far announced their figures for the quarter and first half, but the profits statements that have been published point unmistakably to the fact that the first six months of 1929 have broken all records for earnings in peace times.

The Youngstown Sheet & Tube Co. reported a net income for the June quarter of $6,107,057, allowing for interest, depreciation, Federal taxes, etc., equivalent after dividend requirements on the preferred stock to $5.90 a share on the 1,000,000 shares of the common stock. This compares with $4,430,316, or $4.22 a share on common shares in the first quarter and $2,490,891 or $2.24 a share of common in the June quarter of 1928.

Net income for six months ended June 30, this year, totaled $10,537,373, after above charges, equal to $10.12 a share on common stock, comparing with $4,154,407 or $3.65 a share in the first half of 1928.

The gain in Youngstown's profits in the second quarter over those of the first quarter was $1,676,741, or almost 38 per cent, a surprising record in view of the fact that a considerable portion of the company's capacity is in pipe, which has not been in as great demand during the past quarter as some of the other rolled products.

Donner Had Good First Half

The Donner Steel Co. made only a slight gain in the second quarter over the first, but its net income for the entire first half was more than three times that of the corresponding period last year. Donner's second quarter net income was $644,320 against $634,625 in the first quarter. After charges for depreciation, interest, Federal taxes, etc., this amount, after allowance for dividends on prior preference stock, was equal to $1.29 a share on the common stock, compared with $1.27 in the first quarter.

Net income for the six months of this year totaled $1,278,945 after above charges, equal to $2.56 on the common, against $391,218, or 61c. a share, on the common in the first half of 1928.

Republic's Gain Substantial

The Republic Iron & Steel Co., with a net gain of $386,182 in its second quarter profits over those of the first quarter, or about 13 per cent, did not do quite so well as its next-door neighbor, Youngstown Sheet & Tube Co. Republic's net profit for the second quarter was $3,263,309, after charges for interest, depreciation, Federal taxes, etc., equivalent after dividends on the preferred stock to $3.44 a share on the 819,865 shares of common stock outstanding.

In the first quarter Republic's net profits were $2,877,127, or $3.03 a share on 804,568 shares of common. In the June quarter of 1928 Republic made $1,053,855, or $1.03 a share on the 596,030 shares of common then outstanding. Republic profits for the first half of the year totaled $6,140,435, equal to $6.42 a share on 819,865 shares against $1,541,187 or $1.11 a share on the 596,030 shares in the first half of 1928. Profits for the first half of 1928 included earnings of the Trumbull Steel Co. only for the June quarter.

Reflects Good Situation in Sheets

The Michigan Steel Co.'s profits illustrate the good situation during the first half in the manufacture of sheet steel, which is this company's only product. The net profit for the first half is estimated at $1,185,000 after the usual charges, equal to $5.38 a share on 220,000 shares of common stock. This record is better than the profits of any previous full year. Net profits in 1928 were $1,049,902, or $4.77 a share.

Net Income of Steel and Pig Iron Companies in First Half Much Higher Than in First Half of Last Year

	1929 First Half	1928 First Half	Per Cent of Gain
Youngstown Sheet & Tube Co.	$10,537,373	$4,154,407	153.6
Republic Iron & Steel Co.	6,140,435	1,541,187	298.4
Newton Steel Co.	1,519,889	1,356,933*	...*
Michigan Steel Co.	1,185,000 (estimated)	1,049,902*	...*
Colorado Fuel & Iron Co.	1,384,164†	720,529†	92.1
Donner Steel Co.	1,278,945	391,218	226.9
Acme Steel Co.	1,730,671	1,014,590	70.6
Gulf States Steel Co.	759,885	541,802	40.2
McKeesport Tin Plate Co.	1,084,562	852,974	27.2
M. A. Hanna Co.	1,733,454	446,659	288.1
Columbia Steel Corporation	1,066,737	679,761	56.9
Otis Steel Co.	2,798,398	1,743,066	60.6
Central Alloy	3,324,277	2,240,359	48.4
Superior Steel Corporation	181,377	—32,357	...

*Newton Steel Co. and Michigan Steel Co. did not report earnings for the first half of 1928, so the figures for all of 1928 are used. Both companies made materially more in the first half of this year than in all of last year.

†Colorado Fuel & Iron Co.'s figures are before allowance for Federal taxes.

The Colorado Fuel & Iron Co. did not do as well in the second quarter as in the first quarter. In the first quarter the company earned $918,677 and in the second quarter $465,487.

Ore and Pig Iron More Profitable

Improved conditions this year in the ore and pig iron trades are reflected in the report of the M. A. Hanna Co., which in the June quarter earned $1,351,714, after charges for depreciation, interest, Federal taxes, etc. This compares with $381,739 in the first quarter and $558,425 in the June quarter of last year. The Hanna company's second quarter profits were equal to $12.07 a share on 111,994 shares of 7 per cent preferred stock, on which there are accumulated back dividends. For the first half Hanna's profits were $1,733,454 after above charges, equal to $15.47 a share on preferred.

Otis Steel Earnings

Net earnings of The Otis Steel Co. after all charges, including estimated Federal taxes, were $1,630,218 for the second quarter of 1929, compared with $907,536 for the second quarter of 1928, an increase of 79 per cent.

For the first six months of 1929, after similar charges, the company reported $2,798,398, compared with $1,743,066 for the first six months of 1928, an increase of 60 per cent. Earnings for the first half of 1929 were equivalent to $2.94 a share on the common stock, compared with $1.64 for the first six months of 1928.

President E. J. Kulas reports that the company's output continues practically at capacity, with large bookings indicating considerably less than the usual seasonal slackening.

Central Alloy Steel Corporation

Earnings of the Central Alloy Steel Corporation for the second quarter of 1929 were $1,892,934 after all charges including depreciation and estimated federal taxes. This was equivalent to $1.32 a share on the 1,296,371 shares of common stock outstanding. In the second quarter of 1928, the company reported $1,265,230, after similar charges, or 84 cents a share on the common stock.

For the first half, earnings for the company were $3,324,277, equal to $2.29 a share on common compared with $2,240,359, or $1.46 a share, in the first half of 1928.

The Consolidated Steel Corporation, a combination of the Baker Iron Works, Union Iron Works and Llewellyn Iron Works, reports for six months ended June 30, 1929, net profit

of $366,468 after charges and Federal taxes, equivalent to 85 cents a share on 240,000 no-par shares of common stock after dividends on $1.75 no-par preferred stock. The consolidation of the three Los Angeles companies was effected December, 1928.

Net profit of the Superior Steel Corporation for six months ended June 30 was $181,377, after taxes and charges, against net loss of $32,357 the first half of 1928. Net profit for the June quarter was $73,025, after taxes and charges, against $30,760 in June quarter of the previous year, also after taxes and charges.

Fabricated Structural Steel

One-Half of Past Week's Awards Were for Industrial Projects and Railroad Work

ALMOST one-half of the structural steel awards of the past week totaling 38,000 tons, were for industrial projects and railroad work and a substantial portion of fresh inquiries is for similar classes of jobs. New work which appeared for bids was far below that of the previous week, amounting to less than 34,000 tons.

Outstanding among lettings were 4200 tons for a telephone building in New York, 4000 tons for transmission line towers at Memphis, Tenn., and 3000 tons each for an office building at Boston and for a structure in Baltimore, Md., for the Western Electric Co. The largest inquiry was for 13,200 tons for a subway section in New York, 3800 tons for an office building in Newark, N. J., and 3000 tons for a plant for the Pratt & Whitney Aircraft Corporation at East Hartford, Conn. Awards follow:

MONTREAL, 1500 tons for Legault bridge, to Dominion Bridge Co.

MILLINOCKET, ME., 630 tons, paper mill, to Megquier & Jones Co.

BOSTON, 3000 tons, office building, Franklin and Federal Streets, to McClintic-Marshall Co.

CAMBRIDGE, MASS., 275 tons, Radcliffe College building, to New England Structural Co.

JAMAICA-WARREN, VT., 190 tons, two State bridges, to unnamed fabricator.

MEDFORD, MASS., 160 tons, school, to New England Structural Co.

BROOKLINE, MASS., 120 tons, school, to New England Structural Co.

SOUTH BRAINTREE, MASS., 100 tons, gasoline still supports, to New England Structural Co.

BOSTON & MAINE RAILROAD, 100 tons, west wing of North Station in Boston, to New England Structural Co.

BOSTON & MAINE RAILROAD, 115 tons, bridge at Andover, Mass., to Boston Bridge Works.

NEW YORK, 600 tons, theater on West Fifty-first Street, to Harris Structural Steel Co.

NEW YORK, 4200 tons, building on West Eighteenth Street for New York Telephone Co., to McClintic-Marshall Co.

NEW YORK, 300 tons, Seaboard Bank Building on West Thirty-fourth Street, to Levering & Garrigues Co.

EDWARDS, N. Y., 500 tons, building for St. Joseph Lead Co., to Kellogg Structural Steel Co.

BUCKHILL FALLS, PA., 450 tons, addition to Inn, to McClintic-Marshall Co.

WILKES-BARRE, PA., 280 tons, Kirby Memorial Hospital, to Bethlehem Fabricators.

PENNSYLVANIA RAILROAD, 700 tons, bridges, to Bethlehem Steel Co. and American Bridge Co.

PHILADELPHIA, 360 tons, repairs to Spring Garden Street bridge for Department of Public Works, to Shoemaker Bridge Co.

NORFOLK & WESTERN RAILROAD, 1200 tons, bridges, to Virginia Bridge & Iron Co.

NORFOLK & WESTERN RAILROAD, 875 tons, bridges, to Mount Vernon Bridge Co.

BALTIMORE, 3000 tons, insulated wire building for Western Electric Co., to unnamed fabricator.

BALTIMORE & OHIO RAILROAD, 350 tons, signal bridges, to McClintic-Marshall Co.

BALTIMORE & OHIO RAILROAD, 400 tons, bridges in Ohio, to American Bridge Co.

LOUISVILLE & NASHVILLE RAILROAD, 800 tons, addition to office building at Louisville, Ky., to Louisville Bridge & Iron Co.

MEMPHIS, TENN., 4000 tons, transmission line towers, to Nashville Bridge Co.

MONTGOMERY, ALA., 200 tons, State highway bridges, to Nashville Bridge Co.

GADSDEN, ALA., 325 tons, dirigible hangar for Goodyear Tire & Rubber Co., to Decatur Iron & Steel Co.

ABERDEEN, MISS., 125 tons, bridge over Tombigbee River, to Nashville Bridge Co.

PITTSBURGH, 1300 tons, recreation building for H. J. Heinz Co., to McClintic-Marshall Co.

ERIE, PA., 450 tons, grain elevator for Pennsylvania Railroad, to Pittsburgh Bridge & Iron Works.

MONACA, PA., 350 tons, Pittsburgh Tube Co., to Pittsburgh Bridge & Iron Works.

MICHIGAN CENTRAL RAILROAD, 300 tons, bridges, to American Bridge Co.

MIDDLETOWN, OHIO, 300 tons, Middletown Bank & Deposit Co. building, to Dayton Structural Steel Co.

CLEVELAND, 1000 tons, City Hospital, to unnamed fabricator.

STATE OF INDIANA, 700 tons, miscellaneous work, to Indiana Bridge Co.

WAUKESHA, WIS., 250 tons, additions for Glancy Malleable Iron Corporation, to Worden-Allen Co.

KENOSHA, WIS., 100 tons, shipping platform for Nash Motors Co., to Worden-Allen Co.

STEVENS POINT, WIS., 132 tons, insurance building, to Duffin Iron Co., Chicago.

CHICAGO, 850 tons, West Town Bank building, to Midland Structural Steel Co.

CHICAGO, 190 tons, Goodman Mfg. Co., to Duffin Iron Co.

CHICAGO, 250 tons, manufacturing building, to Duffin Iron Co.

CHICAGO, 1100 tons, Burnham Avenue bridge, to an unnamed bidder.

UNION PACIFIC, 200 tons, foot-bridge, to McClintic-Marshall Co.

CHICAGO & ALTON, 240 tons, bridge work, to American Bridge Co.

ST. LOUIS, 450 tons, Woolworth Building, to American Bridge Co.

GALENA, KAN., 600 tons, building for Eagle-Picher Co., to Illinois Steel Bridge Co., Jacksonville, Ill.

SAN ANTONIO, TEX., 1800 tons, Nix Building, to Orange Car & Steel Co.

LOS ANGELES, 250 tons, bridges for Pacific Electric Co., to Virginia Bridge & Iron Co.

LOS ANGELES, 150 tons, packing plant, 803 Macy Street, to Consolidated Steel Corporation.

LOS ANGELES, 150 tons, hangar for Goodyear Zeppelin Co., to McClintic-Marshall Co.

SAN FRANCISCO, 200 tons, apartment building, Haight and Buchanan Streets, to Golden Gate Iron Works.

SAN FRANCISCO, 140 tons, apartment building, Vallejo and Laguna Streets, to Western Iron Works.

SAN FRANCISCO, 100 tons, alteration to Orpheum Theater, to Western Iron Works.

SAN FRANCISCO, 250 tons plates, seven tanks for Southern Pacific Co., to Chicago Bridge & Iron Works.

BERKELEY, CAL., 125 tons, factory for California Corrugated Culvert Co., to Pacific Coast Engineering Co.

PORTLAND, ORE., 250 tons, sorting racks for Hines Lumber Co., to Poole & McGonigle.

VALE, ORE., 125 tons plates, siphon, to Western Pipe & Steel Co.

KLAMATH FALLS, ORE., 150 tons plates, burner for Weyerhaeuser Timber Co., to Seattle Boiler Works.

Structural Projects Pending

Inquiries for fabricated steel work include the following:

MIDDLETON, MASS., 100 tons, hospital addition.

EAST HARTFORD, CONN., 3000 tons, building for Pratt & Whitney Aircraft Corporation.

NEW YORK CENTRAL RAILROAD, 2400 tons, work at Harmon, N. Y.

STATE OF NEW YORK, 1600 tons, highway bridge at Batchelorville, N. Y.; Pittsburgh-Des Moines Steel Co., low bidder.

NEW YORK, 13,200 tons, section 5, route 108 of subway in Queens.

NEWARK, N. J., 3800 tons, building for American Insurance Co.

ATLANTIC CITY, N. J., 175 tons, addition and alterations to Hotel Flanders, 127 St. James Place.

PENNSYLVANIA RAILROAD, 1000 tons, six bridges.

QUEBEC, Department of Public Works, 2000 tons, bridge between Lachine and Coughnawaga.

QUEBEC, Department of Roads, 200 tons, bridge over St. Jacques River.

HAMILTON, ONT., 1250 tons, four school buildings.

TORONTO, 150 tons, bridge over ship channel at Cherry Street for Harbor Commission.

BUFFALO, 400 tons, post office for New York Central terminal.

BUFFALO, 1000 tons, New York State office building.

CLEVELAND, 450 tons, Christian Science Church.

NILES, OHIO, 200 tons, building for Niles Trust Co.

CHICAGO, 1800 tons, Rosenwald Industrial Museum; R. C. Wieboldt Co., general contractor.

ST. LOUIS, 350 tons, service station for Mack Truck Co.

KANSAS CITY, MO., tonnage not stated, university building.

DALLAS, TEX., 1500 tons, Southwestern Bell Telephone Co. building.

BOISE, IDAHO, 257 tons, reclamation work; bids opened.

Machinery Markets and News of the Works

Tool Buying Well Sustained

Sales Have Been Above Normal and Inquiries Are of Substantial Volume

MACHINE tool buying has been sustained at a rate higher than normal for this time of the year. Sales have run considerably ahead of those in the corresponding period of last year, though not up to the June volume.

The absence of transactions on a large scale has been offset by the steady flow of orders for one or two tools each. Almost all consuming industries have contributed to recent business, which has been well distributed throughout the country. The New York district has been especially active in this respect.

Sales of brakes and presses for manufacture of sheet metal products have attracted attention because of the liberal volume.

Inquiries are sufficiently impressive to indicate that there will be no marked diminution in business during the remainder of the summer. Meanwhile, machine tool plants are operating at capacity to reduce unfilled orders and secure easier deliveries.

United Dry Docks, Inc., New York, is in the market for equipment for a tank shop. A French commission is expected to buy automatic lathes for boring cylinders of airplane motors.

An advance of from 5 to 10 per cent in the prices of some planer builders is noted. One line of engine lathes and a line of milling machines have been increased about 10 per cent.

New York

NEW YORK, July 23.—Although machine tool buying has slowed up a bit, as compared with the peak activity of the past few months, it is still at an unusually high rate for July. No large buying is reported, but there is a steady flow of orders for one or two machines, and local offices are quoting on a good deal of prospective business. This has been an exceptional season for the sale of brakes for sheet metal work. United Dry Docks, Inc., New York, is in the market for complete equipment for a tank shop. Some manufacturers of planers have announced advances in prices ranging from 5 to 10 per cent.

Plans are under way by Third Avenue Railway Co., 2396 Third Avenue, New York, for a two-story addition to mechanical and motor bus repair shop, to cost about $40,000 with equipment. E. H. Faile & Co., 441 Lexington Avenue, are architects.

Mutual Sunset Lamp Mfg. Co., 21 East Houston Street, New York, has leased space in Trade Facilities Building, Brooklyn, totaling 60,000 sq. ft. floor area, and will establish new plant. It is understood that New York factory will be removed to new site.

Brooklyn Borough Gas Co., Mermaid Avenue and West Seventeenth Street, Brooklyn, is said to be planning call for bids on general contract early in August for new shop, automobile service and garage building, 157 x 200 ft., for company cars, to cost more than $200,000 with equipment. Block & Hess, 18 East Forty-first Street, New York, are architects.

Continental Can Co., 1 Pershing Square, New York, is planning an expenditure of about $2,000,000 during next six months for extensions and improvements in plants, including additions to can-manufacturing plant at San Jose., Cal., and enlargement of works at Seattle.

Lehigh Valley Railroad Co., 143 Liberty Street, New York, is planning electrification of lines between Mauch Chunk and Wilkes-Barre, Pa., to cost about $8,500,000 with equipment.

Delaware, Lackawanna & Western Railroad Co., 90 West Street, New York, has awarded general contract to Turner Construction Co., Graybar Building, for new coal pocket and distributing plant, 40 x 308 ft., at South Brooklyn, with conveying, loading and other mechanical equipment, to cost more than $100,000.

Rubel Coal & Ice Corporation, 937 Fulton Street, Brooklyn, is planning expansion in ice-manufacturing division, and will build a group of new plants in Brooklyn, to cost over $5,000,000 with machinery. Company has disposed of coal business and will concentrate activities in future largely in ice production.

United Aircraft & Transport Corporation, operating Chance-Vought Corporation, Long Island City, manufacturer of aircraft equipment, and other interests, has purchased Sikorsky Aviation Corporation, specializing in production of military and other aircraft, with plant at College Point, L. I., and new factory nearing completion at Bridgeport, Conn., and will consolidate. First noted plant will be continued at present location and later will be consolidated with works at Bridgeport. A. C. Dickinson is president.

Atlantic Basin Iron Works, Inc., Van Brunt, Summit and Bowne Streets, Brooklyn, manufacturer of marine engines, valves, forgings, etc., plans rebuilding part of plant destroyed by fire July 17, with loss more than $75,000, including equipment.

Western Electric Co., 195 Broadway, New York, with plant at Kearny, N. J., manufacturer of radio equipment, telephone apparatus, etc., has leased one and three-story plant, 175 x 210 ft., totaling about 45,000 sq. ft. floor space at 132-52 Tichenor Street, Newark, for a tool-making division.

Essex County Vocational Schools, 960 Broad Street, Newark, N. J., will take bids at once for three-story boys' vocational school at Bloomfield, N. J., to cost over $400,000 with equipment. Guilbert & Betelle, 24 Branford Place, Newark, are architects.

V. J. Burnelli, Keyport, N. J., has leased part of local plant of Aeromarine-Klemm Corporation manufacturer of aircraft, for the production of special transport airplanes, including parts manufacture and assembling.

Flintkote Co., East Rutherford, N. J., manufacturer of roofing products, is said to have plans for a two-story addition, to cost more than $40,000 with equipment. Headquarters are in Park Square Building, Boston.

C. M. Gray Mfg. Co., 358 Central Avenue, East Orange, N. J., manufacturer of die-castings, is considering plans for a three-story addition, to cost about $70,000 with equipment.

Board of Education, Cranford, N. J., is considering installation of manual training equipment in new two-story senior high school to cost $700,000, for which plans are being drawn by H. B. Brady, Inc., 333 North Broad Street, Elizabeth, N. J., architect.

New Standard Aircraft Corporation, 230 East Sixteenth Street, Paterson, N. J., is disposing of an additional stock issue, part of funds to be used for expansion. Company is arranging for early production of a new training plane on maximum basis, including parts manufacture and assembling.

United Dry Docks, Inc., 11 Broadway, New York, recently organized to merge several shipbuilding and dry dock plants in New York district, is contemplating erection of new tank shop to cover about 2¼ acres. Company is in market for plate bending rolls, angle bending rolls, a flanging press, electric welding machines and overhead electric cranes. Harry Lindemann, of tank and fabricated steel department, Staten Island, is in charge of prospective work.

Plastic Die & Molding Co., 249 Verona Avenue, Newark, N. J., has been organ-

ized to make stamping and forming dies and permanent molds by a new process. A. B. Strickler is secretary.

Great Neck Manufacturers, Inc., Great Neck, N. Y., has begun manufacture of tungsten hack saw blades under brand name of Monarch. Sales offices are at 162 Chambers Street, New York.

Philadelphia

PHILADELPHIA, July 22.—Bids have been asked on general contract by Schuch Machine Co., 235 New Street, Philadelphia, for one-story plant to cost more than $30,000 with equipment. Charles E. Oelschager, 1615 Walnut Street, is architect.

Kensington Shipyard & Drydock Corporation, Philadelphia, recently organized by Francis J. McDonald, president of Baltimore & Philadelphia Steamboat Co., Pier 3, South Delaware Avenue, and associates, has acquired shipbuilding plants and repair yards of Philadelphia Ship Repair Co., Kensington Shipyard & Drydock Co., Camden Shipbuilding Corporation, Camden, and Noecker & Ake Shipbuilding Co., Camden. New owner will consolidate and operate different properties, and plans expansion. Another plant, also, is projected on waterfront property at Philadelphia, to consist of two graving docks, each with capacity for vessels up to 16,000 tons, 700 ft. and longer, with machine and other shops for repair work, to cost more than $1,000,000.

Bendix Brake Service Co., 3914 North Broad Street, Philadelphia, automobile brakes and equipment, a subsidiary of Bendix Brake Co., South Bend, Ind., will take bids on revised plans for two-story and basement factory branch, service and repair plant, 75 x 175 ft., to cost $150,000 with equipment. H. G. Christman Co., 306 South Notre Dame Avenue, South Bend, is architect.

Fayette R. Plumb Co., Inc., 4837 James Street, Philadelphia, manufacturer of edged tools, plans rebuilding part of plant destroyed by fire July 13.

Board of Trustees, National Farm School, Doylestown, Pa., is taking bids until July 31 for a new farm machanics' building, to cost more than $30,000 with equipment. Edwin H. Silverman and Abraham Levy, Thirteenth and Chestnut Streets, Philadelphia, are architects.

American Radiator & Standard Sanitary Corporation, 40 West Fortieth Street, New York, has purchased plant and business of Thomas Maddock's Sons Co., Trenton, N. J., manufacturer of sanitary ware, and will operate as unit of organization. It is proposed to build addition to Maddock plant at Hutchinson's Mills, to cost more than $300,000. Present officials of Maddock company will continue with purchasing organization.

S. Arthur Fisher and Paul M. Cheesman, 844 High Street, Williamsport, Pa., have organized S. Arthur Fisher Body Co., capitalized at $60,000, to establish plant to manufacture automobile bodies, including truck bodies, a repair division will be provided. Balser Weber, Howard, Pa., is also interested in new organization.

Anthracite Combustion & Engineering Co., Inc., 5120 Wakefield Street, Philadelphia, has been incorporated to manufacture full line of blower equipment for use in homes, schools, churches and institutions. Company has provided manufacturing facilities. It will buy motors, blower castings, fans and temperature controls. F. E. Whitney is president.

Empire Steel Castings, Inc., Reading, Pa., has been incorporated to take over Empire Steel Casting Co. and will carry on business developed by its predecessor in electric alloy and carbon steel castings. Officers of new organization are: President, Frank Hodson; directors, Charles Shipman Payson, Wallace E. Belcher, D. W. Phillips; secretary-treasurer, J. E. Horton. Company has recently completed extensions to its foundry and further additions will be made in near future.

The Crane Market

INQUIRY for overhead traveling cranes is still rather limited and prospective buyers are slow to act on outstanding business. Some locomotive crane buying is reported, contractors beginning to close on some small capacity equipment. The Mallory Machinery Corporation, 522 Light Street, Baltimore, is inquiring for a used 5 to 10-ton, 80-ft. span, 3-motor, overhead crane. The Laclede Steel Co., St. Louis, is inquiring for three 5-ton, 105-ft. span, 3-motor, overhead cranes for its Alton, Ill., plant. The cranes for the new plant of the Great Lakes Steel Corporation at Ecorse, Mich., are reported to have been awarded to the Morgan Engineering Co.

Among recent purchases are:

New York Central Railroad, New York, two 25-ton locomotive cranes from Industrial-Brownhoist Corporation.

B. Levitt, Rome, N. Y., 7½-ton crawl-tread crane from Browning Crane Co.

James Stewart & Co., 230 Park Avenue, New York, two small crawl-tread cranes from Moore Speedcrane Co., 30 Church Street, New York.

Arthur A. Johnson Corporation, Long Island City, New York, small crawl-tread crane for subway work from Koehring Co., New York.

Gulf States Steel Co., Alabama City, Ala., one 40-ton, 73-ft. 3-in. span, blooming mill crane, one 40-ton, 92-ft. span and one 15-ton, 92-ft, span plate mill cranes and one 15-ton, 100-ft. span billet yard crane, from Alliance Machine Co.

South Atlantic

BALTIMORE, July 22.—Plans are under way by Flynn & Emrich Co., 301 North Holliday Street, Baltimore, manufacturer of mechanical stokers, parts, etc., for one-story foundry unit, to cost about $75,000 with equipment. W. S. Austin, Maryland Trust Building, is architect and engineer. James F. Turner is general manager.

Public Improvement Commission, City Hall, Baltimore, is said to be planning installation of manual training equipment in three-story junior high school to cost about $425,000, for which plans will be drawn by Taylor & Fisher, Union Trust Building, architects.

General Electric Co., Schenectady, N. Y., has awarded general contract to Flagler Co., Red Rock Building, Atlanta, Ga., for one-story and basement addition to motor and motor equipment factory branch and service works at Atlanta, 55 x 200 ft., to cost about $50,000 with equipment.

Southern Aviation Enterprises, Inc., Atlanta, Ga., recently formed by R. E. L. Cone, Palmer Building, and associates, is reported planning establishment of aircraft manufacturing plant near Birmingham, including parts and assembling departments for production of five-passenger type airplanes, initial unit to cost more than $65,000 with equipment.

Board of District Commissioners, District Building, Washington, has awarded general contract to English Construction Co., 1311 H. Street, N. W., for extensions and improvements in power plant at district training school at Laurel, Md., to cost about $35,000. Additional equipment will be installed.

Manufacturers' Light & Heat Co., Columbia Bank Building, Pittsburgh, has secured franchise for natural gas supply from properties in western Pennsylvania to Berlin, Grantsville, Meyerdale, Md., and vicinity, and plans installation of pipe lines and systems. It is also proposed to furnish service at Salisbury and adjoining communities.

Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, is making ready to begin work on hydroelectric power project on Little Tennessee River, near Bryson City, N. C., where engineering office has been established. Project will include construction of three power dams, generating stations, switching plants and transmission lines, and is reported to cost more than $12,000,000 with machinery.

Kil Mfg. Co., incorporated for $50,000, has erected a plant at Kilmarnock, Va., to manufacture septic tanks, gutter and spouting, metal cornice, etc. Plant is 50 x 100 ft., two stories. A. W. Wagenseller is president.

New England

BOSTON, July 22.—Sales of machine tools were smaller than those of the previous week, although the majority of dealers did a fair business in single machines. New England sales for the first half of July ran ahead of those for the first half of June, owing primarily to activity in Connecticut. An encouraging feature is that additional inquiries are in hand with a sizable backlog of prospects to work on for the remainder of the year. It is believed that many metal-working plants will place requirements in August to obtain 1929 deliveries on certain types of tools. New England machine tool builders in general are operating at capacity on day shifts, with some maintaining night shifts in certain departments.

Maxium Fire Engine Co., Middleboro, Mass., has started work on a plant to cost $25,000.

John Alden Coal Co., Inc., Gloucester, Mass., will build coal pockets. Handling equipment is required.

Lever Brothers Co., 164 Broadway, Cambridge, Mass., has closed bids on a coal hopper. Conveyor equipment will be needed.

Stone & Webster, Inc., Boston, has preliminary plans for a power house for Everett, Mass., to be built by Edison Electric Illuminating Co. of Boston.

Maine Coal & Dock Co. will build a coaling plant at Bucksport, Me. A hoisting engine of 500 tons per hr. capacity and conveyor belts will be purchased.

City of Bloomfield, Conn., closes bids Aug. 1 for a high school to cost $140,000 with equipment. A manual training department is included.

City of Pittsfield, Mass., has plans for a high school to cost $2,200,000 with equipment. Manual training departments are contemplated.

CARNEGIE LIBRARY OF ATLANTA

Worcester Wire Works, 379 Main Street, Worcester, Mass., has started work on a one and two-story manufacturing unit, 20 x 68 ft.

United Aircraft & Transportation Co., Inc., Hartford, has started work on a plant to cost $2,000,000 with equipment.

Contract has been let by Scovill Mfg. Co., Waterbury, Conn., manufacturer of brass pipe, condenser tubing and kindred products, to Tracy Brothers Co., local, for four-story addition, 21 x 165 ft. to cost more than $65,000 with equipment. H. L. Thompson, Waterbury, is architect.

Plantsville Foundry, Inc., Plantsville, Conn., recently formed with capital of $50,000, will take over and operate former local foundry of Stewart-Walker Co., which recently filed petition in bankruptcy. Victor E. Walker, Meriden, Conn., formerly president of Stewart-Walker Co., will be identified with new organization.

Fairhaven Iron Foundry Co., Fairhaven, Mass., has awarded general contract to Macomber Street Co., 1925 Tenth Street, N. E., Canton, Ohio, for rebuilding one and two-story foundry, 50 x 100 ft., recently destroyed by fire, to cost about $45,000 with equipment.

Board of Education Providence, R. I., plans installation of manual training equipment in new three-story and basement junior high school to cost $1,200,000, for which bids have been asked on general contract. Commissioner of Public Buildings, City Hall, in charge.

Pratt & Whitney Aircraft Co., Hartford, Conn., manufacturer of Wasp aircraft engines, will break ground at once for new plant at East Hartford, with main unit one-story, 400 x 1000 ft.; two-story engineering building, and other one and two-story structures, entire group to cost about $2,000,000 with machinery. Albert Kahn, Inc., Marquette Building, Detroit, is architect and engineer.

Cadillac-LaSalle Co., 563 State Street, Springfield, Mass., representative for Cadillac and LaSalle automobiles, is having revised plans drawn for one and two-story and basement service, repair and sales building, to cost about $115,000 with equipment.

C. H. Dexter & Sons, Inc., Windsor Locks, Conn., manufacturer of paper goods, has purchased, for expansion, local mill of American Writing Paper Co., closed for several months. Some new equipment will be purchased.

Sinclair Refining Co., 205 East Forty-second Street, New York, will begin construction of oil storage and distributing plant at Hartford, to cost over $75,000 with equipment.

Buffalo

BUFFALO, July 22.—Plans have been filed by Trico Products Corporation, 817 Washington Street, Buffalo, manufacturer of automobile equipment and accessories, for one-story addition, to cost about $60,000 with equipment.

Charles Cory & Son, Inc., 183 Varick Street, New York, manufacturer of marine equipment, bells, etc., has acquired plant and business of Tucker Foundry Co., Medina, N. Y., manufacturer of cast iron pipe and fittings, and will take possession Aug. 1. New owner will operate plant as branch and plans expansion.

Buffalo General Electric Co., Electric Building, Buffalo, has plans for new steam-operated electric generating plant adjoining present Huntley station. Initial installation will provide for capacity of 80,000 kw., to be increased later. Project is reported to cost more than $2,000,000 with transmission lines.

Spriesch Tool & Mfg. Co., Buffalo, has been organized by James Spriesch, 179 Keystone Street, and associates, with capital of $40,000, to manufacture tools, dies and kindred products. New company will be affiliated with business heretofore operated under name of Joseph Spriesch, 183 South Elmwood Avenue, manufacturer of similar specialties, and it is understood will succeed to that organization. Thomas F. Morrissey, 135 Winspear Avenue, is also interested in new company.

Board of Education, Little Falls, N. Y., is considering installation of manual training equipment in new two-story junior high school to cost $300,000, for which bids will soon be asked on general contract. C. W. Clark, Savings Bank Building, Cortland, N. Y., is architect; A. R. Acheson, Eckel Building, Syracuse, N. Y., is mechanical engineer.

Airport Advisory Board of City Council, Buffalo, has plans for new marine airport, including two hangars, 125 x 150 ft., with repair facilities, to cost about $135,000 with equipment and other buildings. Nat E. Duffy, director of Genesee Street municipal airport, is in charge.

Fladd-Luig Co., Inc., 213 Central Avenue, Rochester, N. Y., is a jobber of plumbing and heating supplies and is not going into manufacture of machinery, as erroneously stated recently in these columns.

Syracuse Ornamental Co., 581 South Clinton Street, manufacturer of metal specialties, has awarded general contract to Dawson Brothers, Union Building, for extensions to cost about $30,000 with equipment.

Pittsburgh

PITTSBURGH, July 22.—Business in this district continues moderately active. A number of small orders have been placed the past week and new inquiries are appearing regularly. Railroad business, which has not been active since the recent placing of large lists by the Chesapeake & Ohio, has been revived slightly by small inquiries from the Baltimore & Ohio and the Pennsylvania. The Westinghouse Electric & Mfg. Co. has begun to make awards against its third quarter list, but buying by the United States Aluminum Co. for its plant extensions at New Kensington, Pa., is not expected for at least two weeks.

Deliveries have had little opportunity for improvement since the heavy buying movement of the spring and many dealers in this territory are still unable to quote on much business in which they would normally be interested. Local offices are busy preparing estimates on some of the larger prospects pending in the district and there is little prospect of any marked falling off in orders during the remainder of summer and early fall.

Standard Underground Cable Co., Seventeenth and Pike Streets, Pittsburgh, has plans for one-story addition to works at Perth Amboy, N. J., to cost about $200,000 with equipment. Part of Pittsburgh plant will be removed to that location when new unit is completed.

Standard Oil Co. of Pennsylvania, Ledger Building, Philadelphia, is planning an expansion at plant of Pennsylvania Lubricating Co., Lawrenceville, near Pittsburgh, including storage and distributing facilities, to cost more than $500,000 with equipment.

Aluminum Co. of America, Inc., Oliver Building, Pittsburgh, has acquired plant and business of Modern Foundry & Pattern Works, Inc., Oakland, Cal., manufacturer of aluminum castings, etc., and will operate as unit of organization. J. F. Russell and Peter Caird, president and vice-president of Modern Foundry company, will continue in present positions.

Romeson Mfg. Co., Titusville, Pa., recently organized by Gray I. Morriss, Beaver Falls, Pa., and associates, with capital of $150,000, to manufacture iron and steel products, has taken over Titusville plant of American Radiator Co., closed for about two years, and will remodel for early occupancy.

Continental Refining Co., Oil City, Pa., is planning to rebuild part of oil refinery destroyed by fire July 18.

City Council, Wheeling, W. Va., is planning establishment of municipal airport, including hangars, repair shops, oil storage and other buildings, to cost about $650,000. A bond issue will soon be voted.

Detroit

DETROIT, July 22.—Plans are under way by Hancock Iron Works, Pontiac, Mich., for one-story addition, to cost about $35,000 with equipment. R. O. Derrick, Pontiac Savings Bank Building, is architect.

Detroit Steel Products Co., 2250 East Grand Boulevard, Detroit, manufacturer of steel sash and kindred products, has plans for first unit of new plant, totaling 125,000 sq. ft. floor space, to cost more than $300,000 with equipment. Smith, Hinchman & Grylls, Marquette Building, are architects.

In connection with expansion program following acquisition of controlling interest in Lockheed Aircraft Corporation, Los Angeles, mentioned last week, Detroit Aircraft Corporation, Detroit, has leased part of former local plant of Studebaker Corporation, and will equip for manufacture of airplanes, including parts manufacture and assembling.

Old Dutch Refining Co., Muskegon, Mich., has broken ground for a new oil refinery near city, to cost more than $100,000 with machinery.

A. J. Bopp, General Motors Building, Detroit, formerly local district sales manager for Weirton Steel Co., is organizing Bopp Steel Corporation, to construct local plant to manufacture cold rolled steel products. Site has been purchased, and plans for initial unit will be drawn soon, to cost over $100,000 with equipment.

Board of Education, Flint, Mich., plans installation of manual training equipment in new two-story junior high school to cost $550,000, for which bids will soon be asked on general contract. Malcolmson & Higginbotham, 1219 Griswold Street, Detroit, are architects; McColl, Snyder & McLean, Penobscot Building, Detroit, are mechanical engineers.

Following recent purchase of controlling interest in American Cirrus Engines, Inc., 740 Washington Avenue, Belleville, N. J., manufacturer of aircraft engines, by Allied Motor Industries, Inc., Chicago, plans are being arranged for establishment of new plant in part of former works of Wills Motor Car Co., Marysville, Mich., lately taken over by Allied organization. Work will include establishment of two divisions, one for development of new aircraft engine for use by United States Navy, and other for expansion in assembling operations of present engines, now being conducted at Belleville plant, to cost more than $90,000.

Leonard Refrigerator Co., Clyde Park, S. W., Grand Rapids, Mich., has plans for an addition and improvements in present plant, to cost more than $40,000 with equipment.

Michigan Bell Telephone Co., 1365 Cass Avenue, Detroit, has plans for a six-story equipment storage and distributing plant, 340 x 505 ft., with mechanical and electrical repair and service divisions, to cost $1,400,000 with machinery. Smith, Hinchman & Grylls, Marquette Building, are architects.

Chicago

CHICAGO, July 22.—The machine tool market is becoming more active as the end of July approaches. Orders are scattered and usually for small numbers of tools, but many purchases are for large machines so that in point of value, many sellers' current business is more impressive than at the beginning of the month. The used tool market is less active, although the supply is still short of demand.

The Santa Fe has ordered a 600-ton hydraulic wheel press. Other than this purchases by the railroads are quiet. Farm implement manufacturers are showing less interest, although it is not unlikely that a sizable list will be issued early in August. Demand for presses, after having lagged for a time, during which deliveries improved, is brisk and comes from a wide diversity of users.

Prices have been advanced about 10 per cent on one line of lathes and a line of milling machines.

Blackhawk Foundry & Machine Co., Davenport, Iowa, is planning erection of a molding department, 122 x 164 ft.

Oil Products Appliance Co., Maywood, Ill., is erecting a second story to its plant which will provide 19,500 sq. ft. of additional floor space.

American Brake Shoe & Foundry Co., Maywood, Ill., is building an addition to its local machine shop.

Contract has been let by Chicago, Rock Island & Pacific Railroad Co., 139 West Van Buren Street, Chicago, to T. S. Leake Construction Co., 608 South Dearborn Street, for extensions and improvements in engine house and repair shops on Forty-seventh Street, to cost $350,000 with equipment. C. A. Morse is chief engineer.

Electrical Research Laboratories, Inc., 2500 Cottage Grove Avenue, Chicago, manufacturer of radio equipment and devices, has acquired plant of Cable Piano Co., for expansion.

J. E. Decker & Sons, 320 Fifteenth Street, N. W., Mason City, Iowa, have plans for new six-story addition to meat-packing plant and lard refinery, to cost $300,000 with equipment. H. Peter Henschien, 1637 Prairie Avenue, Chicago, is architect and engineer.

W. F. & John Barnes Co., Rockford, Ill., manufacturer of drills, drilling machinery and other machine tools, has plans for new two or three-story unit, to cost more than $70,000 with equipment. A. Eliel, Stewart Building, is architect.

Western Screw Mfg. Co., 4413 West Kinzie Street, Chicago, has awarded general contract to Anderson & Winblad, 6235 Michigan Avenue, for two-story plant, 170 x 322 ft., to cost $100,000 with equipment. A. Epstein, 2001 West Pershing Road, is architect and engineer.

Colorado Fuel & Iron Co., Pueblo, Colo., plans early rebuilding of portion of coal mining plant at Segunda, Colo., recently destroyed by fire, including tipples and equipment.

Onsrud Machine Co., 3910 Palmer Street, Chicago, has awarded general contract to Austin Co., for one-story addition, 80 x 100 ft., to cost about $35,000 with equipment.

Thomas Kelly & Brothers, 3424 West Lake Street, Chicago, manufacturers of plumbing equipment, brass goods, etc., have leased space in building at 4442 West Roosevelt Road, 75 x 125 ft., for expansion.

Midwest Carbide Corporation has recently been organized by National Lead Co. and Shawinigan Products Corporation, New York, a subsidiary of the Shawinigan Water & Power Co. of Canada, to carry on manufacture of calcium carbide at Keokuk, Iowa, heretofore conducted by United Lead Co., subsidiary of National Lead Co. Officers of new company will be supplied from staffs of owning interests, E. J. Cornish, president, National Lead Co., becoming president; L. F. Loutrel, vice-president of Shawinigan Products Corporation, vice-president and general manager of new company, and T. F. Wettstein, formerly of United Lead Co., vice-president, and continuing in charge of manufacture.

Biflex Products Corporation, Decatur, Ill., is erecting an addition, 150 x 160 ft., and is moving machinery and business of its bumper plant at Waukegan to local works. About $100,000 will be spent on new equipment.

Fisher Governor Co., Marshalltown, Iowa, has purchased Apex Regulator Co., Decatur, Ill. Apex products are closely allied with those of purchasing company, which manufactures automatic pressure control specialties for steam, water, air and oil and gas industries. Equipment of Apex company will be removed to Marshalltown, where Fisher Governor Co. will operate Apex company as a separate unit.

Indiana

INDIANAPOLIS, July 22.—E. L. Cord, president of Auburn Automobile Co., Auburn, and associates have organized Corman Aircraft Corporation, with capital of $50,000 and headquarters at Connersville. New company is said to be planning establishment of local factory, including departments for parts production and assembling. Mr. Cord and associates are now operating an experimental aircraft plant at Dayton, and it is understood that this will be consolidated with new company later. L. E. Manning and Raymond S. Pruditt are interested in new concern.

Board of Education, 150 North Meridian Street, Indianapolis, is said to be planning installation of manual training school in new three-story and basement junior high school to cost $600,000, for which bids are being asked on general contract until Aug. 1. McGuire & Shook, 941 North Meridian Street, are architects.

United States Corrugated Fibre Box Co., 1315 Martindale Avenue, Indianapolis, has asked bids on general contract for one and two-story and basement plant, to cost about $200,000 with machinery. Charles E. Bacon, Odd Fellows Building, is architect.

Glascock Brothers Mfg. Co., 1515 West Fifteenth Street, Muncie, manufacturer of bottle coolers, dispensers and similar equipment, has awarded general contract to G. W. Ewing & Son., 1919 West Eighth Street, for three one-story additions, to cost about $45,000 with equipment.

Kunkle Valve Co., Fort Wayne, has awarded general contract to Bueshing & Hagerman Co., 402 East Superior Street, for two-story service building, 60 x 150 ft., to cost about $40,000 with equipment.

L. S. Guetti Tool Co., 113 North New Jersey Street, Indianapolis, has been organized to manufacture special tools and gages. Company is in operation.

Cincinnati

CINCINNATI, July 22.—New machine tool business in this district is in good volume for this season of the year, and plants are maintaining capacity production to clean up unfilled orders. Inquiry, although for only one or two machines at a time, is sufficiently brisk to give promise of a steady volume of fresh bookings. Among new orders the past week were two from automobile manufacturers and one from a tool maker for medium sized planers. A French Commission, which has established headquarters at Cleveland, has requested information on automatic lathes for boring airplane engine cylinders.

Bids will soon be asked by Dayton Rubber Mfg. Co., West Riverview Avenue, Dayton, Ohio, for a two-story addition, to cost about $150,000 with equipment. Schenck & Williams, Third National Bank Building, are architects. J. A. McMillan is president.

Ovens, power equipment, conveying and other machinery will be installed by General Baking Corporation, 420 Lexington Avenue, New York, in extensions to plants at Columbus, Ohio, Louisville and Indianapolis, including improvements in present units. Expansion at Columbus plant will cost about $600,000, and at other two bakeries $350,000 each, for completion by close of year.

City Council, Nashville, Tenn., is arranging fund of $250,000 for extensions and improvements at McConnell airport, to be used as a municipal field, including new hangar units, repair and reconditioning shops, and other buildings.

City Council, Tippecanoe, Ohio, is said to be planning early call for bids for extensions and improvements in municipal electric light and power plant, including installation of additional equipment, to cost $100,000. Collins H. Wight, Dayton Savings & Trust Building, Dayton, Ohio, is engineer.

Knoxville Structural Steel Co., Knoxville, Tenn., recently organized by H. R. Adams, Knoxville, and associates, with capital of $100,000 has acquired property on Central Avenue as site for new steel fabricating plant, with main unit, 60 x 100 ft., to cost about $75,000 with equipment.

City Council, Kingsport, Tenn., is considering establishment of municipal airport on Reedy Creek, where site has been selected, to include hangar, repair shop, oil storage and other units, to cost more than $50,000.

Board of Education, Springfield, Ohio, is planning installation of manual training equipment in new junior high school to cost $250,000, for which bids are being asked on general contract until Aug. 2. Eastman & Budke, First National Bank Building, are architects.

City Council, Jackson, Tenn., is arranging bond issue of $750,000, for a municipal electric light and power plant,

to include either purchase of existing local central station with expansion program, or construction of new plant.

Wyatt C. Hedrick, Inc., First National Bank Building, Forth Worth, Tex., plans construction of six-story automobile service, repair and garage building at Memphis, Tenn., 148 x 150 ft., to cost more than $400,000 with equipment.

Milwaukee

MILWAUKEE, July 22.—Although inquiries are in large volume, there are signs of easier tendencies in the equipment markets, with relief in tension especially noticeable in machine tools. Prosperity among the machine manufacturers is inducing many to undertake expansions which indicate good fall and winter demand for equipment.

Glancy Malleable Iron Corporation, 840 Wisconsin Central Street, Waukesha, Wis., has begun work on a foundry addition, 118 x 208 ft., to be followed by another unit for shipping department. Plans are by A. A. Wickland & Co., consulting engineers, 205 West Wacker Drive, Chicago. Worden-Allen Co., Milwaukee, is general contractor.

Giddings & Lewis Machine Tool Co., Fond du Lac, Wis., is building an addition for assembling and erecting to cost $100,000, and will install 20-ton electric crane, Austin Co., Cleveland, Ohio, designers; Immel Construction Co., Fond du Lac, has general contract.

Wisconsin Valley Electric Co., Wausau, Wis., has started reconstruction of its hydroelectric power plant on Wisconsin River, near Tomahawk, Wis., at cost of $140,000.

City of West Allis, Wis., is taking bids until July 30 for furnishing and installing a 1,000,000-gal. elevated steel tank for water supply extension. William Darby is city engineer.

St. Louis

ST. LOUIS, July 22.—Contract has been let by Marquette Cement Mfg. Co., 401 Louderman Building, St. Louis, to Gamble Construction Co., 620 Chestnut Street, for storage and distributing plant to cost about $90,000 with equipment. L. E. Ritter, 140 South Dearborn Street, Chicago, is architect.

Mack International Motor Truck Corporation, 2804 Pine Street, St. Louis, manufacturer of motor trucks, with headquarters at 25 Broadway, New York, will soon take bids for a one-story service, repair and sales building, to cost $230,000 with equipment. H. E. Foster, 400 West Madison Street, Chicago, is architect.

City Council, Kansas City, Mo., is arranging fund of $500,000 for establishment of new municipal airport, consisting of hangars, repair shops and other units. Main structures will have total floor space of 160,000 sq. ft. City engineering department, City Hall, will be in charge.

Missouri Power & Light Co., Board of Trade Building, Kansas City, Mo., is planning extensions in power plant at Jefferson City, Mo., and installation of additional equipment. Work will be carried out in connection with new transmission line between Jefferson City and Mexico, Mo., with power switching stations and other structures, entire project to cost more than $300,000.

Seven-in-One Brake Co., 1430 Baltimore Avenue, Kansas City, Mo., automobile brakes and equipment, has leased one-story and basement building to be erected at 3222 Gillham Plaza, for new service and repair works, to cost about $40,000 with equipment. Hoit, Price & Barnes, Telephone Building, are architects.

International Agricultural Corporation, 61 Broadway, New York, has purchased 20-acre tract in College Hill section, Texarkana, Ark., as site for new one-story plant 140 x 300 ft., to manufacture commercial fertilizers to cost about $140,000 with machinery.

American Eagle Aircraft Corporation, Kansas City, Mo., manufacturer of airplanes and parts, has purchased Wallace Aircraft Co., Chicago, manufacturer of a special three-piece folding wing monoplane, and will consolidate. Chicago plant, which has capacity for about one complete plane unit per week, will be removed to Kansas City, where increased production will be developed. With this acquisition, purchasing company will produce seven different types of aircraft. E. E. Porterfield, Jr., is president.

Charles F. Haller, Parsons, Kan., is at head of project to construct a new plant to manufacture aluminum products. Negotiations are under way with Chamber of Commerce, Fulton, Mo., for suitable site.

Midwest Stove & Enameling Co., 1100 South Charles Street, Belleville, Ill., has leased 5,000 sq. ft. of floor space from C. Heinz Stove Co., Second and Chestnut Streets, St. Louis, for manufacture of sheet iron heaters.

Cleveland

CLEVELAND, July 22.—Contract has been let by Reliance Electric & Engineering Co., 1088 Ivanhoe Road, Cleveland, manufacturer of electric motors, generators, etc., to J. L. Hunting Co., Guarantee Title Building, for one-story addition, 150 x 175 ft., to cost about $115,000 with equipment.

Patterson Foundry & Machine Co., East Liverpool, Ohio, manufacturer of pottery machinery, etc., has awarded a general contract to Potters' Lumber Co., East Liverpool, and Hiner Structural Steel Co., Canton, Ohio, for one-story machine shop, to cost $135,000 with equipment.

Electric Auto-Lite Co., Toledo, Ohio, manufacturer of automobile starting and lighting equipment, etc., has purchased John W. Brown Mfg. Co., Martin Road, Columbus, Ohio, manufacturer of automobile lamps, headlights and kindred products, and will consolidate. Expansion in output is planned.

White Motor Co., East Seventieth Street and St. Clair Avenue, Cleveland, manufacturer of motor trucks, has plans for one-story service, repair and sales building, to cost $200,000 including equipment. Hadlow, Hughes, Hick & Conrad, 819 Euclid Avenue, are architects.

Ford Motor Co., Detroit, has awarded general contract to Krebay Construction Co., New City Trust Building, Indianapolis, for extensions and improvements in branch assembling plant at Cleveland, to cost $200,000 with equipment.

Mohawk Rubber Co., Akron, Ohio, has asked bids on general contract for a three-story and basement addition, 75 x 100 ft., to cost about $135,000 with equipment. Henry & Murphy, Second National Bank Building, are architects.

Logan Gear Co., Toledo, Ohio, and Bingham Stamping Co., with local plant for manufacture of sheet metal stampings, have arranged for a consolidation. New company will have a capital of 190,000 shares of stock, no par value, with assets totaling $2,000,000. Expansion in output is planned.

Gulf States

BIRMINGHAM, July 22.—Plans are in progress by Brown Paper Mill Co., Monroe, La., for additions to mill at West Monroe to double present capacity, and to cost more than $4,000,000. George F. Hardy, 309 Broadway, New York, is consulting engineer.

Phillips Petroleum Co., Bartlesville, Okla., has authorized enlargements in oil refinery at Borger, Tex., to cost more than $100,000 with machinery.

Dallas Power & Light Co., Dallas Tex., has work under way on addition to steam-operated electric generating plant, making a total output of 100,000 hp., for station. Extensions will be made in transmission lines and power switching facilities. Entire project will cost about $3,000,000 and is scheduled for completion by end of year.

City Council, Beaumont, Tex., has plans for establishment of municipal airport, including steel hangars, oil storage and distributing building, repair and reconditioning shops, to cost more than $65,000 wth equipment. R. C. Black, city engineer, in charge.

Linde Air Products Co., 30 East Forty-second Street, New York, manufacturer of commercial oxygen, welding apparatus, etc., has awarded contract to J. M. Brown, Shreveport, La., for one-story and basement plant at Agurs, to cost $50,000 with equipment.

International Lubricant Corporation, Canal Bank Building, New Orleans, has plans for new two-story plan, 60 x 100 ft., to manufacture lubricating specialties, to cost about $30,000 with equipment.

T. A. T. Flying Service, Inc., Fort Worth, Tex., a subsidiary of Southern Air Transport, Inc., same address, has purchased 380-acre tract near Wichita Highway, about six miles from city, for establishment of commercial airport, including steel hangars, repair shops, and other mechanical units, to cost about $200,000 with field development. T. A. T. Flying School, Inc., will establish buildings and headquarters at new location, while another subsidiary, Southern Aeromotive Service, Inc., will construct main repair and service works there for concentration of operations.

Board of Education, Greenville, Miss., is considering installation of manual training equipment in two and one-half story junior high school to cost $220,000, for which bids will soon be asked on general contract. N. W. Overstreet, Mississippi Fire Insurance Building, Jackson, is architect.

East Bank Water District No. 1, Jefferson Park, Kenner, La., plans early call for bids for steel water tank and elevated steel tower, pumping machinery, and auxiliary equipment for waterworks project to cost $1,250,000. Bond issue in amount noted has been voted. Henry A. Mentz & Co., Hammond, La., are engineers.

Texas Air Transport Flying Service, Inc., Fort Worth National Bank Building, Fort Worth, Tex., is planning hangar, with machine and repair shop at municipal airport at El Paso, Tex., to cost about $50,000 with equipment.

Pacific Coast

SAN FRANCISCO, July 18.—Miller-Schofield, Inc., Los Angeles, recently organized with capital of $5,000,000 by officials of Harry Miller Mfg. Co., and Schofield, Inc., both of same city, to manufacture engines for motor boats, airplanes and automobiles, is said to be completing plans for establishment of local plant, to cost more than $200,000 with equipment.

Boeing Air Transport Co., Inc., Balboa Building, San Francisco, with headquarters at Seattle, has awarded general contract to Austin Co. of California, San Francisco, for aircraft manufacturing plant on 10-acre tract near municipal airport at Oakland, Cal., to cost more than $300,000 with equipment. Company also has another plant in progress at Los Angeles, to cost about $400,000 with machinery.

Angelus Oil Tool Corporation, Los Angeles, has plans for one-story plant, 35 x 115 ft., to manufacture oil well drilling tools and equipment, to cost about $25,000 with equipment. Lawrence Nowell, 4814 Loma Vista Street, is architect.

Mine & Smelter Supply Co., Salt Lake City, Utah, has purchased local property as site for new three-story storage and distributing plant, with heavy hardware and machinery departments, to cost $130,000 with equipment. Main plant is at Denver.

Marchant Calculating Machine Co., Emeryville, Cal., manufacturer of computing machines and parts, has plans for a one and two-story addition, to cost $60,000 with equipment. Miller & Warnecke, 1404 Franklin Street, Oakland, Cal., are architects.

Phoenix Aircraft Corporation, Phoenix, Ariz., Floyd Stahl, secretary, in charge, has plans for airplane manufacturing plant, one story, with departments for parts production and assembling, to cost about $65,000 with equipment.

Southern Pacific Co., 500 South Central Avenue, Los Angeles, has plans for new locomotive and car repair shops on San Fernando Road, consisting of engine house, $140,000; one-story machine shop, 74 x 225 ft., $100,000; power house, 50 x 55 ft., and other buildings, to cost $275,000 with equipment.

Pacific Coast Pulp & Paper Co., Richvale, Cal., has awarded general contract to Charles S. Mabrey Co., Inc., Fourth and J Streets, Sacramento, Cal., for new units, comprising machine room, 60 x 225 ft.; two-story beater room, 75 x 120 ft.; boiler plant, 50 x 90 ft., and other structures, to cost $400,000 with machinery.

Axelson Airplane Engine Co., recently formed as a subsidiary by Axelson Machine Co., 6160 South Boyle Avenue, Los Angeles, has awarded general contract to Consolidated Steel Corporation, Los Angeles, for new one-story plant, 120 x 220 ft., at Huntington Park, for parts production and assembling, to cost $90,000 with equipment.

Archer Blower & Pipe Co., 641 East Sixty-first Street, Los Angeles, Cal., has been incorporated to succeed Archer Blower & Pipe Co. Company will manufacture blowers, piping systems and inhibitors, chiefly for industrial plants. Jules F. Archer is president.

Claggett Overhead Irrigation & Lawn Sprinkler Co. has been organized as subsidiary of Claggett Pipe & Supply Co., 2834 Sunset Boulevard, Los Angeles, Cal. Former company will manufacture general sprinkler equipment, pipe and irrigation supplies. Walter Meek is manager.

Southern California Gas Co., Los Angeles, has applied for permission to construct and operate a natural gas pipe line from Kettleman Hills section to points in San Joaquin Valley, totaling about 150 miles, with booster stations, etc., to cost $1,400,000. It is also proposed to build a line for similar service from Huntington Beach to La Jolla, to cost more than $250,000.

City Council, Mount Pleasant, Utah, is planning construction of municipal electric light and power plant, to cost $40,000 with equipment. A bond issue will be voted.

Foreign

OFFICIALS of Torrington Co., Torrington, Conn., manufacturer of metal specialties, swaging machinery, bicycle parts, etc., have organized a subsidiary to operate in Great Britain, under name of Torrington Co., Ltd., capitalized at £5000 (about $25,000), and is said to be planning establishment of plant facilities.

General Electric Co., Schenectady, N. Y., is said to be planning construction of new plant at Monterrey, State of Neuvo Leon, Mexico, for manufacture of electric lamps, to cost more than $500,000 with equipment.

Berlin Electric Co., Berlin, Germany, has arranged for loan of $3,000,000 in United States, considerable part of proceeds to be used for expansion.

Chinese Nationalist Government, Peking, through National Council of Reconstruction in China, has authorized construction of two radio broadcasting stations, and equipment will be purchased in United States, including steel towers, power station apparatus and broadcasting equipment for short-wave operation.

Municipalities and Local Commissions Section, Ministry of the Interior, Cairo, Egypt, is asking bids until Aug. 13 for an electric power plant, including equipment, with underground and overhead transmission and distributing lines for town of Maghagha in Minieh Province.

American Smelting & Refining Co., 120 Broadway, New York, has expansion program under way at plant in northern Peru, to include installation of sintering machines and auxiliary equipment to cost over $750,000. Work is scheduled for completion late in fall.

N. I. Stamatiu, Bulevardul Basarab 17, Bucharest, Roumania, desires to receive drawings and descriptions, together with prices in lei, of snow plows of American type for use on Roumanian railroads. Price is to be named c.i.f. Port Roumain, Braila, Galatzi or Constanta. Tenders are to be addressed to N. I. Stamatiu for transmission to "Administration Generale des Chemins de Fer de Roumanie."

Aeronautics Bureau, Government of Japan, Tokyo, is arranging an appropriation of 3,845,292 yen ($1,768,834) to be expended for new civil airports at Tokyo, Fukuoka and Tsushima, along line of new international airway from Tokyo to Seoul in Korea, during 1929, '30 and '31, including hangars, repair and reconditioning shops and other mechanical buildings.

Fabrica Nacional de Automoviles, S. A., Barcelona, Spain, recently organized with capital of 16,000,000 pesetas to manufacture automobiles, is planning construction of plant near city noted, where headquarters will be maintained, including parts manufacture and assembling. Branch plants and service branches will also be established in different parts of country.

Canada

TORONTO, July 22.—The machine tool market in this territory is beginning to show more life. Inquiries, while mostly for single tools, are improving and a few lists are appearing for a half dozen tools. Some good purchases have been made the past week for plants under construction. Mining development work has stimulated demand for equipment in Ontario, Quebec, Manitoba and Saskatchewan, and some good-sized orders are expected within the next few weeks. Small tools are moving freely.

City of Edmundston, N. B., will start work soon on construction of a power house and dam which, with equipment, will represent an expenditure of $200,000. Thomas Gwerette is clerk. H. G. Acres & Co., Ltd., Ferry Street, Niagara Falls, Ont., is consulting engineer.

Several contracts have been awarded for a $500,000 foundry at St. Laurent, Que., for Robert Mitchell Co., Ltd., 750 Belair Street. Anglin-Norcross, Ltd., is general contractor.

Hull Iron & Steel Foundries, Ltd., Montcalm Street, Hull, Que., has awarded general contract to Gordon Black, Leaside Avenue, for an addition to cost $200,000.

Hamilton Boiler Works, 925 King Street West, Hamilton, Ont., will build a one-story factory to cost $20,000.

Ontario Refinery Co., in which Consolidated Mining & Smelting Co., and International Nickel Co. are interested, has awarded the general contract to Fraser Brace, Ltd., 107 Craig Street, Montreal, for a copper refinery at Copper Cliff, Ont., to include an electrolytic tank house, 300 x 400 ft., and two casting buildings, each 200 x 300 ft.

Southern Canada Power Co., will start work immediately on a 2000-hp. electric development plant at Burroughs Falls, near Drummondville, Que.

Fairchild Aircraft, Ltd., recently incorporated with a capital stock of $2,000,000, has purchased 265 acres near Montreal, and will establish an airport, build hangars and erect a plant to manufacture airplanes.

Skinner Co., Ltd., Oshawa, Ont., has plans for an automobile bumper manufacturing plant.

New Trade Publications

Refractories for Power Plants.—Charles Taylor Sons Co., Cincinnati. An eight-page booklet, contains information of a technical and practical nature in regard to fireclay brick for boiler settings. After discussing refractoriness, shrinkage, slag erosion, spalling, joints and chemical analysis, the booklet describes Taylor-made fire brick.

Manganese Steel.—American Manganese Steel Co., Chicago Heights, Ill. An eight-page pamphlet illustrating and describing new applications and unusual uses for manganese steel, for Fahralloy, and Amsco products.

Heat Treatment of Gray Iron.—Whiting Corporation, Harvey, Ill. An eight-page pamphlet entitled, "Heat Treatment of Gray Cast Iron" is a reprint of an article by Dr. Edward E. Marbaker, director of foundry research department of the Whiting Corporation, published in the interest of the foundry industry by that company. It is a reprint of an article in THE IRON AGE of Aug. 2, 1928.

Two Weeks War Against Waste

Whirlwind Campaign Among Employees of Pontiac Plant Brought 3558 Suggestions, a Third of Them of Value and Pointing to Annual Savings of $542,000

A WAR against waste in a whirlwind campaign lasting two weeks was made recently by the Oakland Motor Car Co., Pontiac, Mich. Ammunition employed included forceful speaking by plant executives, posters and display boards galore, a special daily newspaper as well as machine guns, martial music and other means of arousing a waste prevention spirit among the workers and of bringing out suggestions of ways to cut production costs and eliminating waste.

As an incentive, $1,247 in prizes were offered. The intensive campaign brought out 3558 suggestions for stopping waste and improving production methods. When a start was made in checking over the suggestions, it was felt that if 3 per cent of the suggestions proved of tangible value the campaign would have proved successful. However, about 35 per cent of the suggestions were found to be valuable, and these, it is claimed, will result in an annual saving of $542,000.

Numerous other suggestions have not yet been definitely passed on, having been referred to the engineering department to determine whether they are practical. The company spent approximately $16,000 in conducting its war against waste and regards this as a very profitable investment.

The prize money was divided into about 100 individual prizes. A grand prize of $100 was offered the employee who sent in the best suggestion. In addition, the plant was divided into five sectors and 19 prizes aggregating $220 were offered in each sector, ranging from a $50 first prize down to ten sixth prizes of $5 each.

To increase interest in eliminating waste and in the contest, numerous display boards, for which prizes were offered, were placed throughout the plant, illustrating graphically loss due to waste. At the top of the display boards were effective slogans. Posters in color were placed in all departments and for these prizes were given as well as a prize for the best 500-word article on waste elimination.

The campaign against waste was led by Gordon Lefebvre, vice-president in charge of operations and chairman of the Permanent Waste Committee of the Oakland company. Mr. Lefebvre sounded the call to arms in a declaration of war here reproduced.

Extensive preparations were made for the campaign by various committees. A member of the general committee made a trip to Washington to confer with the Department of Commerce officials and to secure suggestions as to the best method of conducting the campaign. Assistance was rendered by the Committee on Elimination of Waste in Industry of the Federated American Engineering Societies, and companies that had conducted similar campaigns were asked to give their experiences and make recommendations.

The intensive campaign continued for two weeks. Noonday meetings were held in the plant cafeteria, during which short talks were made by various executives. Alfred P. Sloan,

Declaration of War

WHEREAS:—There have grown up with this industry, and entrenched themselves firmly within its lawful domains, certain lawless and disturbing elements; and

WHEREAS:—Said elements are in continual and persistent conflict with our march of progress, and

WHEREAS:—Said elements having flourished undisturbed have grown to the point where they now threaten the peace and security of our business, the successful and orderly pursuit of our labors, and have constituted themselves a menace to our future prosperity, and

WHEREAS:—They have established themselves in defiance of all regular and authorized laws governing the conduct of the business of which we are a part

WHEREFORE, Be It Resolved:—That we, the officers and employees of the Oakland Motor Car Company, this sixth day of May, nineteen hundred twenty-nine, through our regularly constituted representatives in convention duly assembled, do hereby declare war upon the aforesaid offenders—Namely, Extravagance, Inefficiency and Waste; and do pledge all our physical, and such financial resources as may be necessary to wage to successful conclusion this war against them, to the end that we may again be free and undisturbed in the happy pursuit of our labors, and the permanent possession of the benefits which must acrue from a successful prosecution of this war.

Signed:

G. LEFEBVRE,
General Chairman

Jr., president of the General Motors Corporation, in a letter commending the Oakland company for its campaign, said: "I know that the major items of expense in our corporation are well controlled, but I also feel that there remains a wonderful opportunity in scientifically regulating the minor items. The cumulative total waste of small material items reaches an enormous sum."

At the start of the campaign suggestion blanks were distributed to the workmen. Mr. Lefebvre issued a bulletin in which he listed subjects for consideration in preparing suggestions.

The campaign aroused considerable interest among executives of other General Motors units and a party of the higher executives, including President Sloan and various officers of different units, spent a day visiting the plant and seeing how the campaign was being conducted. These visitors were greatly impressed.

A military demonstration was the feature during another day, when a squad of machine gunners of the 125th Infantry visited the plant and blasted the enemy—Waste—with machine gun fire, bugles and martial music.

The publication of a newspaper, the "Reflector," was one of the effective features of the campaign. This was issued daily for the two weeks, and a few additional issues were published later to announce the results. This four-page paper covered from day to day the various activities in connection with the campaign and contained articles on waste prevention by executives and department heads. It also carried numerous illustrations, including reproductions of photographs taken in the plant showing waste in different departments, photographs of posters and of many of the leaders in the campaign, as well as numerous cartoons.

The suggestion that won the first prize was a plan to use Philfuel for the block test of motors in place of gasoline or city gas. This suggestion contained full details as to the cost of installing the equipment necessary for

KEEP SENDING IN WASTE SUGGESTIONS, FITCH URGES

By BURR FITCH

A few weeks ago an appeal was made to you men to use your heads, your heads and your practices in the manner best suited so as to bring about a reduction in the expenditure of wasted effort, expense materials and your own lost time that is drilled, reamed or otherwise machined into every scrapped part.

The Exhibit boards, as made by you, have strikingly illustrated to every person in this organization the extent and thoroughness with which this common enemy Waste has permeated the business.

A suggestion sent in and carrying in its written ideas an idea for Waste Elimination classified the signer as a thinker as well as a worker, as a constructive rather than a destructive unit of the Oakland Organization.

To the hundreds of you who have responded to this appeal we thank you, and we are sincere in the hope that you will be glad in the thought that you are one of the family—proud of the suggestion you have sent in and of the opportunity to serve.

Oakland has many hard tasks she wants to get done this year, next year, and years to come. Knowing that so many men seek, naturally, the easiest way, she attaches great importance to the suggestion method of discovering those men in the ranks who do care and are thinking of three tasks.

The man who throws his better self into his job seems to draw new strength and energy that sustain him in the difficult climb to advancement.

Take it from me, the fellow who persists in doing his job better may be trampled on by others who don't care, but to endure with patience and self control is no bad element in the preparation of a man for the great number of things, in the Oakland Family, that must somehow someway be done better.

You are now provided with the permanent form of Suggestion Blank and through the Reflector acquainted with details of the permanent plan.

We want one or more suggestions from every employe. We want you to feel free to express yourself without fear that you will incur the displeasure of someone of greater authority.

Your suggestions will be treated strictly confidential by the Suggestion Committee. Each suggestion will be given a number which will be its only identity to the various people who may investigate your recommendations and put them in operation.

We believe there are thousands of men in Oakland employ who are in possession of a great many ideas valuable to them and to the Company. Believing that you are willing to advance those ideas in the form of suggestions we are giving you a permanent, convenient means to express yourself and a way to pass it on directly to the Suggestion Committee.

FOUR BOARDS GIVEN HONORS

(Continued from Page One)

will be necessary for Mr. Lefebvre to present more special loving cups than he had at first intended to give. The groups which worked on the winning boards will be Mr. Lefebvre's guests at a jolly and exclusive picnic expedition into the wild woods. The date of the outdoor party will be announced as soon as Mr. Lefebvre completes arrangements to obtain the loving cups.

The boards are so good that it is intended to retain them permanently. Detailed information regarding their future disposition will be printed in an early issue of the Reflector.

A repair job TODAY Keeps the junk man AWAY

MANY MORE PRIZES T NEW WASTE ELIMI

Until the winners in the War campaign are chosen and announced, don't mark time or let up in your efforts toward eliminating Waste.

Regular awards will vary in amount from $2.50 and upwards, depending upon the value of the suggestions to the company. An award of $5.00 in addition to the regular awards will be paid, upon

Poor Way to Be 'Taken fo

WAR ATTRACTS MUCH INTEREST

(Continued from Page One)

ment of the Westinghouse Electric and Manufacturing company, who is vice-chairman of the Engineers' Waste Elimination Committee.

Westinghouse Also Active

Westinghouse, which also is active in matters of waste elimination, learned of Oakland's campaign and obtained copies of War literature of which the following letter of May 13 is an acknowledgment:

Dear Mr. Chalmers: It was

SPECIAL BATTLE SERIES

REFLECTOR

PUBLISHED FOR OAKLAND PONTIAC EMPLOYEES

WAR ON WASTE

VOL. 2—NO 3 — OAKLAND MOTOR CAR CO., PONTIAC, MICH. — TUESDAY, JUNE 25, 1929

WAR WINNERS NAMED

Campaign Nets Half Million

C. J. Flynn of Standards Dept. Wins High Award

Given Grand Prize For Recommending Substitution Of G-4 Philfuels For Gasoline On Block Test

SAVING EACH YEAR TO RUN TO HUGE SUM

35% of Suggestions Point Ways to Gain $542,000 Annually

3658 PLANS RECEIVED

Oakland's War on Waste cost approximately $16,000. From concrete evidence of the waste prevention spirit demonstrated by the volunteers, this will be only a small proportion of the intangible returns which will accrue from the War.

According to Gordon Lefebvre, about 35 per cent of the suggestions received will effect a projected saving of $542,000, while a like amount may be expected from the balance of the suggestions which were set aside for further investigation by the Permanent Committee.

Everybody Happy

Add to this the intangible values accruing from the extra care and pains taken throughout the plant during the campaign to fling the Demon Waste, and you get into important money—so important in fact that the Management is tickled pink with the way the volunteers came through.

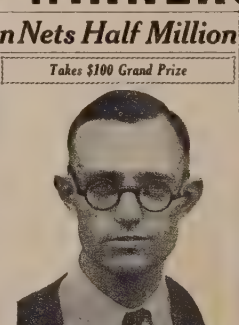
"In launching the Waste War," said Mr Lefebvre "we felt that if three per cent of the suggestions received were of tangible value the War would be a success.

"Yet, when we began checking over the heaps of suggestions received, we found that instead of three per cent being good, the average was nearer 35 per cent.

"This fact demonstrates the high type of constructive thinking our men are capable of doing and shows me in a very forcible manner the unusual standard of the men whom we are glad to have connected with Oakland.

"In all 3358 suggestions came in up to the deadline set at the end of the two weeks' campaign. However, 300 additional ones arrived the first of the following week and were counted in with

Takes $100 Grand Prize



Chester J. Flynn

ANTI-WASTE IDEAS NEED BE ONLY SIMPLE AND PRACTICAL

A reading of Mr. Flynn's numbered among those in the prize money were comparatively simple—just sound constructive ideas plainly presented on the suggestion blank.

Don't get the idea, after reading the best plan, that you have to be as detailed as Mr. Flynn was in order to qualify for a prize from the Permanent Suggestion committee. Remember the men who first thought of putting creases on the ends of pencils, and the wiggle in a hairpin, the hump in a hook and eye, and the fortunes they accumulated.

Often the simplest things are best. If you feel you have a hot idea, get it down on paper as quickly and as clearly as you know how, and shoot it in. The competitive War is over. Every practical plan now wins a prize

What Ho! Lads, Listen To This

Attention, all you prize winners! Wednesday night June 26 is the big night.

That night promptly at 7:00 P. M. you are to report at the Old Mill Tavern at Waterford for such a feast and entertainment as would repay you for all the effort put into winning the prizes. In addition the Big Shots will be on hand to present you with your cash money.

Every one of the 96 men listed in the tables as a winner is to be on deck. The general Committee and subcommittees also will be there, as well as the Superintendents.

It's your hour in the spotlight, so be on hand tomorrow at 7 p. m. sharp.

THANKS FOR YOUR HELP

As this issue winds up the special battle series of the War Reflector, the staff takes this opportunity to thank the entire Oakland organization for the fine cooperative spirit shown in contributing solicited and unsolicited articles. The staff regrets that many of you contributed worthy articles and poems which space did not permit to be used.

Judges Have Tough Job

Choosing the best plans from the 3,558 suggestions received proved by far the hardest task yet encountered in connection with the campaign. To assure a fair distribution of prizes the judges: Gordon Lefebvre, L. A. Blackburn, Walter Rea, Burr Fitch and Wayne Eddy—had to read and re-read the entire group of plans and then check back to determine the accuracy of claims made by the suggestors.

So outstanding was Mr Flynn's grand prize suggestion that the Judges issued the following statement:

Committee Pleased

"It is with great pleasure that the General Committee for the "War on Waste" Campaign, after many days and nights of studying the many suggestions submitted by employes of the Oakland Motor Car Company, announces Chester J Flynn for the Grand Prize, on the suggestion of using Philfuel for Block Test, as compared with Gasoline or City Gas.

"The selection of Mr. Flynn's suggestion for the Grand Prize was unanimous. In addition Mr. Flynn has made numerous other suggestions, which project almost as much as the returns on the Philfuel suggestion.

"Mr. Flynn, in making this study, left nothing for the General Committee to investigate. He developed all of the costs.

CARNEGIE LIBRARY OF ATLANTA

Waste Eliminating Suggestions Offered at Outset of Campaign

ELECTRIC lights and gas fires burning needlessly (gas fires could in many cases be equipped with pilot lights).

* * *

Motors and tools running idly.

* * *

Leaky air hose, water and steam pipes.

* * *

Acetylene torches burning needlessly (could in some cases be equipped with automatic shut-off).

* * *

Scrapping of good material (work with inspection).

* * *

Excessive amounts of tools in workmen's drawers.

* * *

Use of high-priced expense materials for low-priced.

* * *

Wrong use of mallets, files, high-speed steel, carbon steel, etc.

* * *

Excessive consumption of waste and other expense materials.

* * *

Accumulation of unnecessary or excessive amounts of materials, which should be credited back to stores.

* * *

Defective workmanship.

* * *

Removal of unused equipment of all kinds.

* * *

Repair of cracks and crevices in benches, floors, etc., which form receptacles for holding small items such as screws, nuts, washers, etc.

the use of this gaseous fuel. The estimate showed a saving of 6½ cents per motor tested or $2,597 per month based on a production of 1600 motors per day. The cost of the equipment required was placed at $32,943, which would be amortized in about 12½ months.

In the display board contest there were 115 entries. The winning board on one side bore the slogan, "Not a part of the car, but a part of the cost," below which were displayed various small parts that had been scrapped because of defects. On the other side was the slogan, "Use it right—stop the waste." Below this were listed various supplies, such as tools, emery cloth, lamps, belting, grease, fittings, babbitt, etc.

Some of the saving that has been accomplished by the General Motors Corporation by standardization and simplification was referred to in one of the articles in the war campaign publication. This stated that in 1925 the executives of the corporation, realizing that 70 per cent of an automobile is composed of minor parts, instituted a study of the additional savings that might be accomplished through further reduction in the variety of these parts. At that time the average automobile built by General Motors contained 13,000 different parts. One type of bolt was used for one purpose and a slightly different type for another. Different threads were used on different screws. As a result of this investigation the General Motors Corporation in one year reduced the average number of parts in a car from 13,000 to 2110.

Bearing Bronzes Best Suited to Lack of Lubricant

RESEARCH paper No. 68 of the United States Bureau of Standards deals with bearing bronzes made with and without zinc. It was written by H. J. French and E. M. Staples of the bureau. It includes a study of the wearing properties, hardness, structure, toughness and resistance to deformation at temperatures up to 600 deg. Fahr. Based on this study, the bronzes in the copper corner of the copper-tin-lead system have been classified according to the character of service for which they seem best adapted.

Bronzes with less than 4 per cent tin were considered unsuitable for general bearing service. They have low resistance to deformation and wear rapidly in the absence of lubrication. Bronzes with less than about 5 per cent lead seem to be suited only for such service as has the lubrication maintained. Bronzes containing more than 5 per cent lead were found best able, of any of the groups, to operate for short periods without lubricant. With increasing lead percentages, up to 15, the bronzes showed bettering characteristics in this respect, but no appreciable advantages appear in raising lead above 15 per cent.

Addition of 4 per cent of zinc to the copper-tin-lead alloys had, in general, a good influence upon the properties of the bronze. The changes observed included a tendency toward higher hardness and resistance to deformation under repeated blows, to lower friction and lower wear in the absence of oil. However, the effects of zinc additions up to 4 per cent are small and may be insignificant in comparison with changes in properties readily produced from variations in foundry practice.

"Don'ts" for Chain Users

A folder on welded chain recently issued by American Chain Co., Inc., Bridgeport, Conn., contains the following advice on things to avoid:

Don't load a chain above its rated capacity.
Don't subject a chain to jerky loads.
Don't use a chain that appears defective.
Don't fasten chain over sharp corners.
Don't save money by making "home made" slings.
Don't use slings at acute angles if avoidable.
Don't think annealing is a "cure all" for chain ills.
Don't buy chain of doubtful quality.
Don't tie knots in chains or allow them to become twisted.

High-Speed Strip

ROLLS on Continuous Principle Up to 2400 Ft. a Minute and In Coils Up to 2000 Lb. in Weight

ROLLING of long lengths of hot strip at high delivery speeds and in a range of sizes and gages not ordinarily produced on a single mill has been achieved in a unit recently placed in operation at the Sharon, Pa., plant of the Sharon Steel Hoop Co. It rolls strip 2½ x 0.028 in.; 6 x 0.035 in.; 8 x 0.049 in., and 10 x 0.065 in. at speeds up to 2400 ft. per min. and in coils from 150 lb. to 2000 lb. All strip sizes are produced from 30-ft. billets.

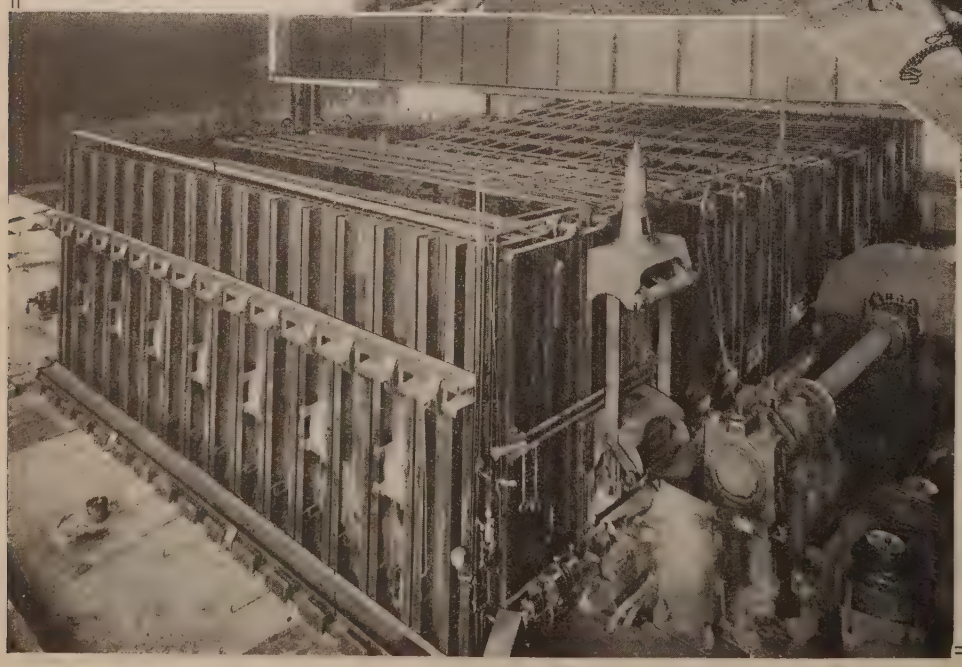
The mill and handling equipment are located in two parallel buildings about 500 ft. in length, which extend from the billet storage transcept to the hot warehouse loading transcept buildings. The billets are delivered to the furnace from a mechanical billet platform by a motor-driven roller table through a pinch roller located in the corner of the furnace.

The furnace is 32 ft. wide by 47 ft. long on the hearth, and is completely inclosed on the sides and ends with rolled steel plates. Between the brick walls and the steel plates insulating material has been placed to conserve the heat. The furnace is equipped with a Morgan special metal pipe recuperator stove. A double pusher, electrically driven, is installed for pushing billets through the furnace, and a Morgan-Hawthorne pushout for discharging the billets. A flat roof furnished by the American Arch Co. is used on this furnace. The furnace is fired with producer gas from a Morgan new type producer located near the furnace. The producer, it has been proved, may be depended on to gasify 6000 lb. of coal per hr. The furnace has a capacity of 60 tons of 2-in. thick billets or slabs per hr.

A Morgan up-and-down cut shear is placed between the furnace and the roughing mill. This shear is fed by a set of motor-driven pinch rolls when it is necessary to cut the billets into short lengths; otherwise, the billets are pushed from the furnace directly into the roughing mill.

The roughing mill consists of five trains of 18-in.

THERE Are Six Trains of 14-in. Rolls in the Finishing Mill. The strip is delivered on edge. In the background are the roughing mill and the furnace



PINCH Rolls and An Up-and-Down Shear May Be Seen (view at left) At the Discharge End of the Furnace Which is Enclosed on Sides and Ends with Rolled Steel Plates

Mill at Sharon, Pa.

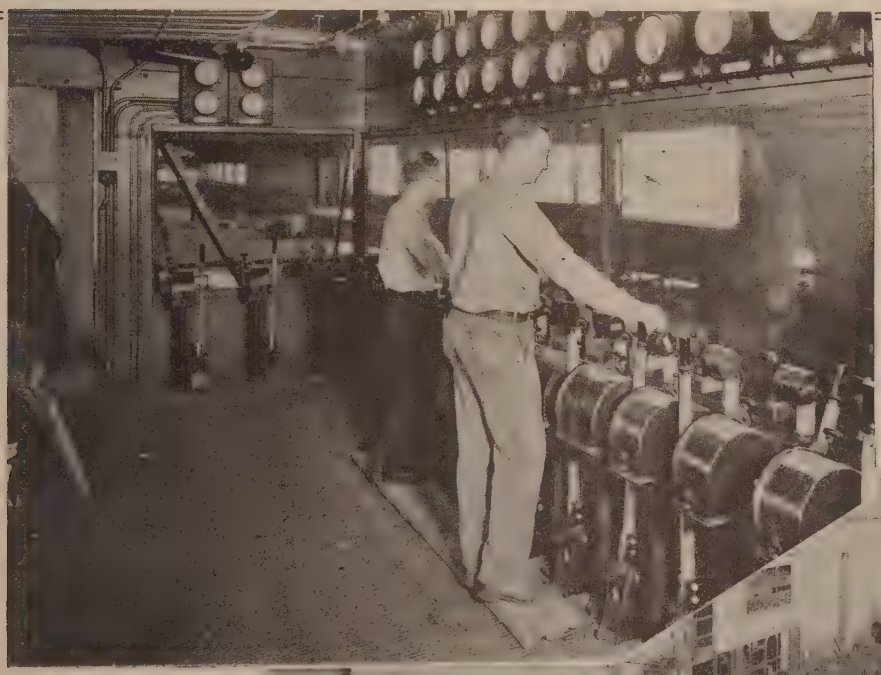
REGULATION of Driving Motors and Means to Prevent Scratching the Product Among the Features

rolls, which are driven by a variable-speed direct-current motor through reducing and helical bevel gears. The bevel gears are inclosed in oil-tight welded steel bases and covers. In the roughing group, four Morgan edging mills with 16-in. and 12-in. rolls are installed. All edging mills are driven by separate motors. Hydraulic water sprays of 1000 lb. pressure are employed in the roughing mill for the removal of all furnace scale and to insure a good surface. After the roughing mill a Morgan steam flying shear is installed for cropping the front ends of the strip.

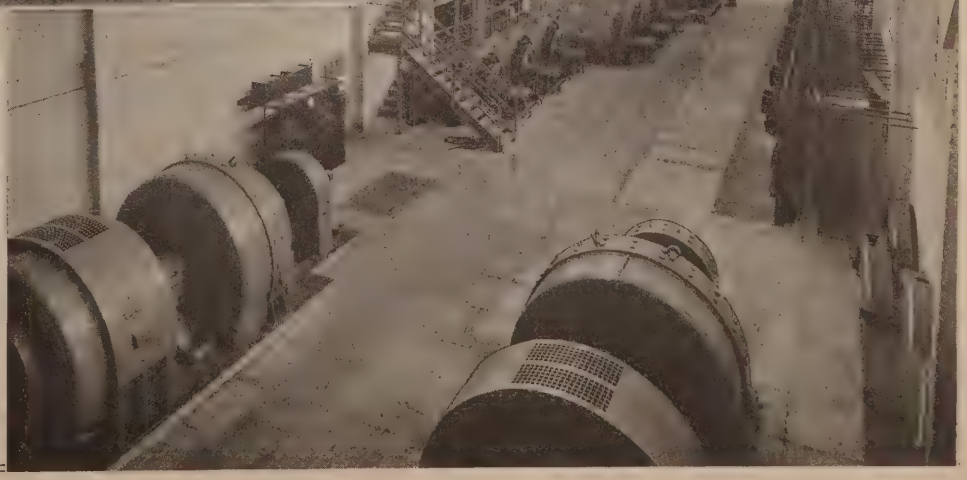
The finishing mill consists of six trains of 14-in. rolls. Each of these is driven by an individual variable-speed direct-current motor. Double armature motors are used on the first three trains. The six motors are mounted on one large bed plate. Novel features are employed in handling the strip, and in the guides and looping devices, to prevent scratching the product during the rolling operations and afterward when being delivered to the loading and pickling departments.

The strip is delivered from the last finishing mill through a twisted trough to either of two vibrators, which in turn deliver the strip on edge in serpentine form upon slowly moving conveyors. The front end of the piece is then placed in motor-driven pinch rolls that feed it into a shear for cropping, and then into the reel for coiling. The cropping shear may also be used for dividing the strip so that light weight coils may be made without reshearing. When the coil is completed, a motor-driven pulloff places the coil on a conveyor which carries the coils into the loading building where they are assembled on trucks. There are two complete sets of vibrators, conveyors, shears, coilers and delivery conveyors.

The power for this mill is received at 2300 volts, 60 cycles, 3-phase, and is converted to direct current of 600 volts in two 4500-kw. motor-generator sets with a 250-kw. 250-volt direct-connected exciter on each set. One exciter is used for excitation and control purposes, and the



ON the Control Platform Are the Motor Controllers, Meters and Speed Indicators. The roller on mill floor gives orders through a microphone and loud speaker



MOTOR-GENERATOR Set Is in Foreground, Finishing Mill Motors in Left Center and Roughing Mill Motor and Gear Drive in Background

other exciter is used for the auxiliary motors required for the mill. There is also a 250-volt plant service line available for emergency. The roughing mill motor, being of wider spread range than customary, a Ward-Leonard control is employed, using one of the direct-current generators for this service. This arrangement is separately controlled so that it does not interfere with the operation of the other motors. The finishing and edging mill motors are equipped with magnetic control, dynamic braking and emergency reversing.

Operator Gets Instructions through Loud Speaker

In the operating pulpit the following devices are mounted so that the operator has complete control of the motors at this point:—Master switch for starting, stopping and reversing each drive; spring return master switch for the motor-operated coarse adjustment field rheostat for each drive; lever-operated field rheostat for fine speed adjustment for each drive; speed indicators for each drive, and ammeters for each drive. The operators in the pulpit receive instructions regarding operations and speed changes from a loud speaker mounted in the pulpit, the roller talking into a microphone located on the operating floor.

All the mill motors are equipped with speed regulating equipment that holds the speeds of the different motors constant regardless of the load being carried by the different motors. The speed regulators for the edging mill motors are regulated in conjunction with the roughing mill motor, so that as the speed of the roughing mill is changed the speed of the edging mill motor is automatically changed. This avoids separate adjustment of the edging mill motors every time there is a change of speed required for the roughing mill. The speed of each edging mill can, however, be adjusted separately when required. The vibrator motors are also equipped with speed regulators.

The mill was designed and built by the Morgan Construction Co., Worcester, Mass. The electrical equipment was furnished by the General Electric Co., Schenectady, N. Y. The Sharon company's construction force took care of the erection of buildings, the installation of foundations for the machinery, and the mounting of the machinery in place.

German Views on Use of Open-Hearth Decarburizers

TWO articles have recently appeared in issues of *Stahl und Eisen* discussing the use of different decarburizing agents in the open-hearth process, one by S. Schleicher, in the issue of April 4, 1929, pages 458 to 462, and the other by E. Killing, in the issue of April 18, 1929, pages 527 to 531.

In the first article on the general subject of "Comparative Economy of Various Decarburizers," Mr. Schleicher says:

> Trials were made in an open-hearth furnace with various decarburizers with the object of discovering the effect of these on the cost of the process. Rolling mill scale proves to be the most economical, the value of the iron gained being slightly in excess of the cost of the scale and lime added. With pure Swedish ore, after balancing gains and losses, the cost works out at 2.46 shillings per 100 kg. of carbon requiring to be burned. Using siliceous hematite (with Fe_2O_3 57.71, and SiO_2 40.8 per cent.), the cost becomes 10.84 shillings per 100 kg. of carbon burned, the reason for the much higher cost being the increased quantity of lime added and the higher loss of iron by burning.
>
> The quantity of oxygen in the decarburizer does not in the least affect the speed of decarburization, but it does determine the amount of decarburizer required. The decarburizer should be added in a quantity corresponding to the rate of combustion of the carbon in the bath. If added in excess of that rate, the excess iron of the ore used is slagged, instead of going into the bath.

In the second article under the general heading "Conditions on Which the Effects of Decarburizing Agents Depend," E. Killing says in substance:

> The chief factors to consider in choosing a decarburizer are the iron content, the quantity and form of combination of the oxygen, the degree of acidity or basicity, the amount of injurious constituents, the mechanical condition and the moisture, free or combined. The effect of the decarburizer is mainly influenced by the time at which it is added, the bath temperature, the composition of the charge and of the slag, the composition of the gas and quantity of air for combustion, and the hearth area.
>
> The kind of ore chosen may have quite an appreciable effect on the cost of production. The theoretical calculations concerning the advantage of ferric oxide as compared with ferrous have proved true in practice. A high silica content in a decarburizer greatly reduces its efficiency.

Temperature Measurement by Means of Color Transition

WHAT appears to be a new principle in optical pyrometry is incorporated in an instrument recently described by Dr. G. Naeser.*

As is well known, the radiation from a "black body" is composed of the various primary colors, the relative amounts of each depending on the temperature of the radiator. This is the basis for the conventional scheme of "color temperatures."

The new pyrometer contains first a filter which transmits only two wavelengths—such as red and green. The light is then passed through a wedge-shaped filter in which one wavelength—the green—is absorbed more completely with increasing thickness than the other. As a result part of the wedge appears green and part red. At the division between the two colors a line of white appears, due to the equal absorption of red and green. A change in temperature produces a change in the relative amounts of red and green in the radiation, with consequent lateral shift of the white line along the wedge.

It is claimed that an accuracy of plus or minus 13 deg. C. is obtained between 900 and 2000 deg. This could doubtless be increased considerably. One possible difficulty is that of partial color-blindness of the operator—if the eye is more sensitive to red than to green, the white will apparently be displaced toward the green end of the wedge. This may be taken care of, says Dr. Naeser, by sighting first with one eye and then with the other.

Stahl und Eisen, April 4, 1929.

Edgar Allen Steel Co., Inc., 741 Washington Street, New York, exclusive representative in the United States of Edgar Allen & Co., Ltd., Sheffield, England, has opened an office at 704 Fisher Building, Detroit, and will carry complete stocks of Allen tool steels in that city.

Conveyors Reduce Assembly Costs

Studebaker Corporation Cuts Labor Expense 15 Per Cent and Doubles Output by Using Conveyors for Sub-Assembly and Final Assembly Operations

IN doubling its capacity for producing automobiles, the Studebaker Corporation has rearranged its plant at South Bend, Ind., so that the major part of the sub-assembly and final assembly work is done on conveyors. While mechanical handling of materials has become the rule rather than the exception in the automobile industry, chief interest lies in the new uses and the increasing flexibility of the systems which are installed to meet the special needs of each manufacturer.

At the Studebaker plant there are innovations in handling parts which should attract more than passing attention. Motors, for example, are carried on an overhead conveyor 2810 ft. from the motor building to the final assembly lines, where they are lowered into the chassis. This conveyor is capable of handling 177,000 lb. of work at one time and of delivering 100 motors an hour to four final assembly lines, motors being distributed along the conveyor at 10-ft. intervals.

Another unusual installation is an overhead chain conveyor for transporting all chassis sheet metal parts from the enameling and lacquer departments through three floors of three buildings to the final assembly lines. This conveyor is 2200 ft. long.

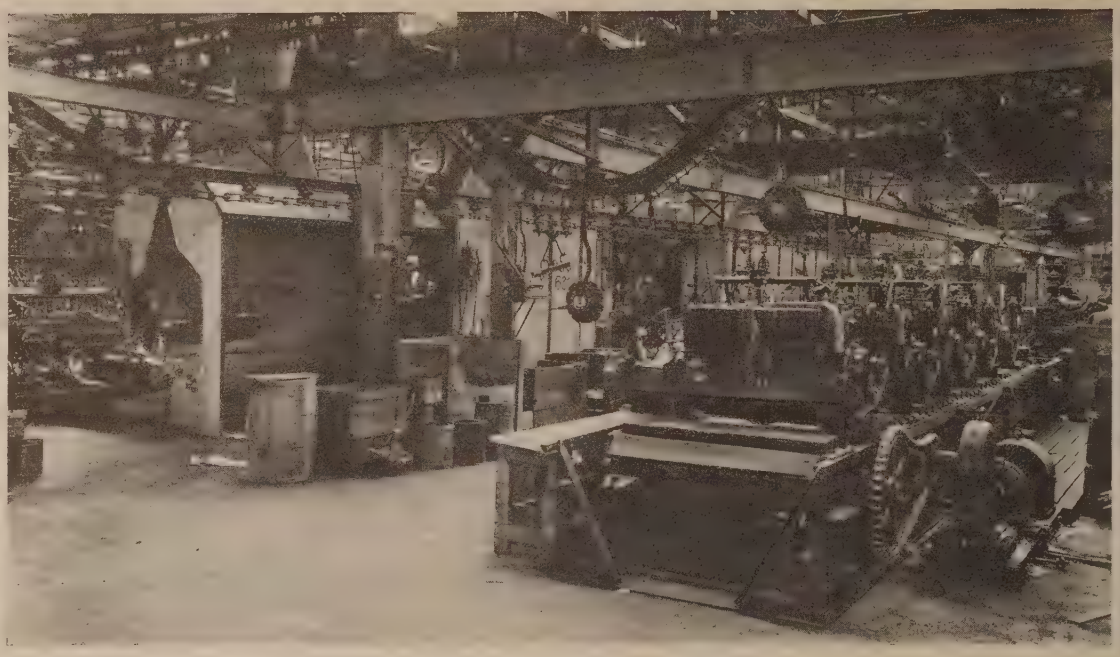
There are many other features indicating increased skill and efficiency with which mechanical conveyors are being used. Where space is needed for manufacturing operations, overhead conveyors are raised to a point which does not interfere with the operation of machine tools or other equipment. At other points, where material carried by the conveyor must be within reach of workmen or where conveyors cross one another, the monorail carrier dips conveniently.

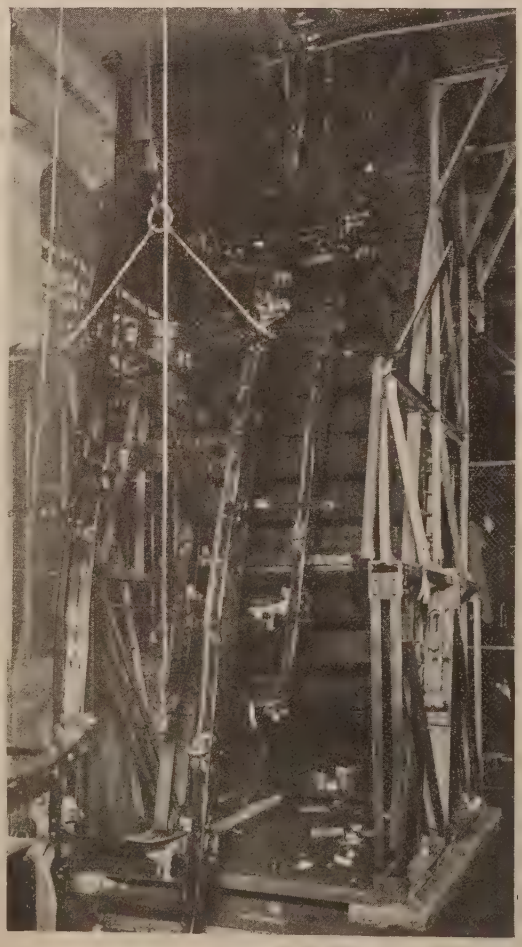
Versatility Shown in Design of Hooks

Aside from the flexibility of the conveyors, great versatility has been shown in the design of special hooks and carriers on which parts are placed for movement along the conveyor line. These hooks have been made so that parts can be attached to them with a minimum of time and effort and can be transported without damage.

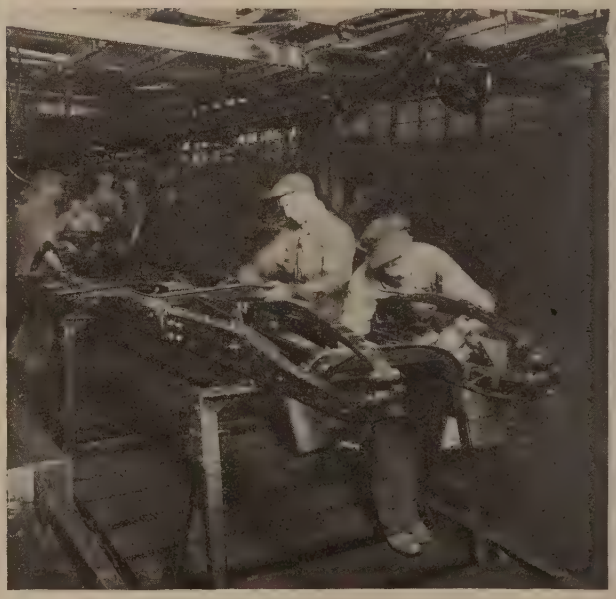
The conveying system is by no means confined to overhead conveyors, for the roller type also has been installed in connection with certain operations. Cylinder blocks, for example, are machined on tools adjoining four parallel roller conveyors 800 ft. long. Differing from the practice in some other automobile plants, Studebaker

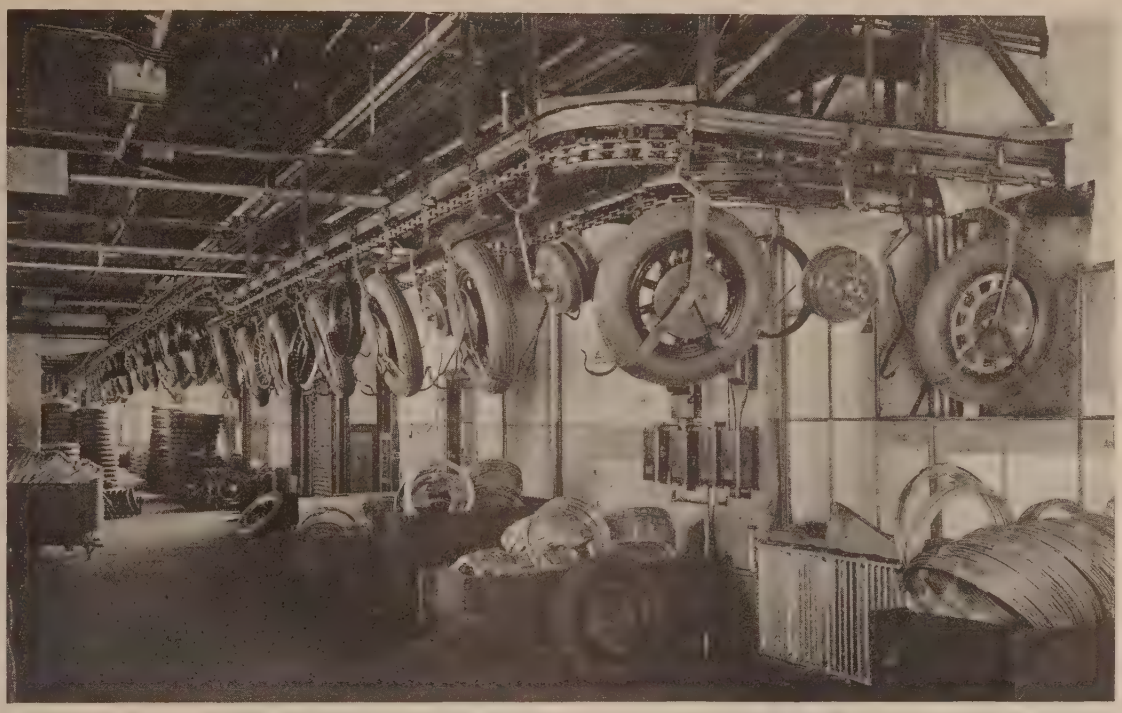
TO Avoid Interfering with Manufacturing Operations, Motors Being Carried by Overhead Chain Conveyor to Main Car Assembly Lines Move From One Floor to Another Along Wall Just Outside Building. Protection against accidental fall is afforded by metal screen running beneath conveyor





MOTORS Are Set Crosswise on Short Slat Conveyor with Flywheel End Overhanging So That Transmission Can Be Assembled (Above). Frames are carried at 15-deg. angle from first to second floor of assembly building on double-chain slat type conveyor (left). Springs and axles are added (below) while frame is in upside down position on slat conveyor with structural uprights 30-in. high





WHEELS Are Carried on Special Racks on Overhead Chain Conveyor to Assembly Line (above). Garnish moldings and instrument boards (below) are delivered to body assembly line by overhead conveyor

engineers have not routed conveyors under machine tools in order to have machining done without removing the cylinder blocks from the conveyors; instead a rope hoist is employed to lift cylinder blocks from conveyors on to machine tools, and in this way delays are avoided when tools are being repaired.

Running at right angles to the cylinder machining lines and connected to them are four roller conveyors on which motors are assembled. It is here that connecting rods, valves, camshafts, pistons and crankshafts are added to the cylinder block. During their progress along the line, motors are upside down for part of the journey, but are righted in a "barrel turnover." For boring the face of the flywheel housing, motors are taken off the conveyor by crane and are set in a specially-designed boring stand.

At the end of the assembly line, motors are placed by crane on a chain conveyor equipped with steel plate carriers, which carry motors at a 30-deg. angle. The framework of this conveyor is narrow so that operators can get at the motors easily. The use of the conveyor has eliminated the necessity of constructing rotating stands for the motors and has proved economical. It is here that the flywheel, clutch, cylinder head, timing gear, timing gear cover, starter, generator, water pump, ignition system, manifolding and carburetor are assembled.

Motors Transferred to Run-In Stands

Motors are transferred from the chain conveyor to run-in stands by crane, where they are cleaned and driven with kerosene, and from there to dynamometer stands for a dynamometer test. From the dynamometer stands motors are picked up by crane and set crosswise on a short slat conveyor with the flywheel end overhanging so that the transmission can be assembled. Transmissions come to the assembly line on an overhead chain conveyor, which crosses all four main motor assembly lines. The slat conveyor runs to the edge of the crane bay, where motors are removed by crane and hung on the motor delivery conveyor, which carries them to the main assembly lines. The transfer work is done while the motor delivery conveyor is in motion.

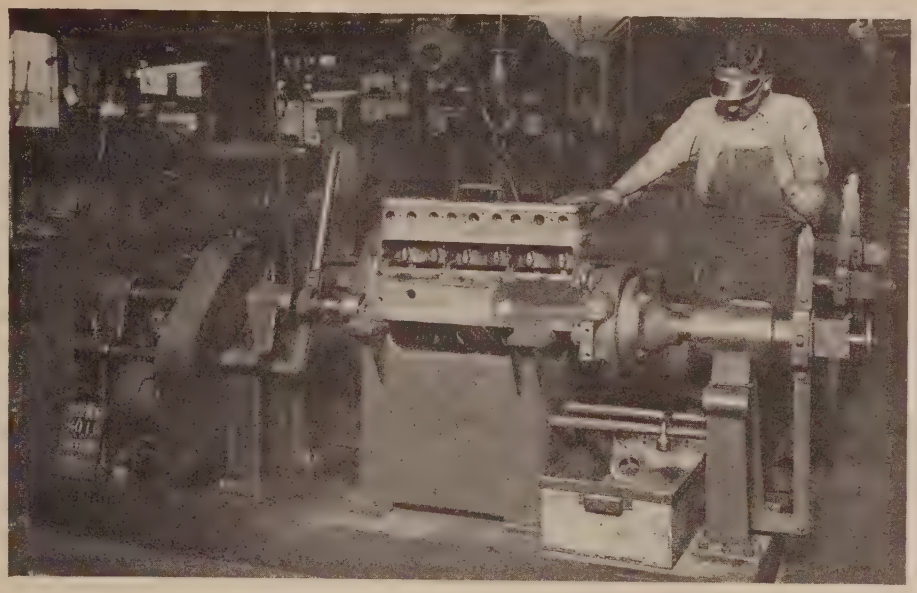
Motors on the delivery conveyor go through a paint spray booth, where they receive a coat of paint, and then begin the journey to the main car assembly lines. During this trip they are routed so as to avoid interfering with manufacturing operations. At some points they move from one floor to another on the overhead conveyor along the wall just outside the building. In such cases protection against accidental fall is afforded by means of a metal screen running beneath the conveyor. This conveyor carries eight-cylinder motors weighing 1200 lb. including transmission, at a speed ranging from 4.16 ft. to 16.6 ft. a min. It is operated by a 5-hp. motor and has a dual mechanical drive.

TO Save Floor Space in Assembly Building, Bodies Are "Nosed" by a Specially Designed Mechanical Device and Are Stored in That Position to Await Movement to Main Assembly Lines

In the piston department, pistons are handled on a roller conveyor which in every respect, except size, resembles a standard roller conveyor. It is just wide enough to accommodate a piston, and its rollers are made of ¾-in. standard pipe. It was designed and built by the company. Crankshafts are delivered from the machining department to the motor assembly lines on an overhead chain conveyor on which they are hung endwise.

All Conveyors Lead to Main Assembly Lines

The main car assembly lines are the central point to which all parts are delivered, and consequently all conveyors used for carrying these parts have the assembly lines as their destination. Front axles are machined on the fourth floor of the machine department building, the work flowing from the west to the east end, while rear axles are machined on the third floor. At the east end



FOR Boring Face of Flywheel Housing, Motors Are Taken Off Conveyor by Crane and Are Set in Special Boring Stand

of the fourth floor, front axles are hung on an overhead conveyor which passes down to the third floor, where rear axles are added. The conveyor then goes through a spray booth and axles receive a prime coat of paint. From the spray booth the conveyor travels down a bridge to the second floor, where it serves the axle storage department, and thence moves to the four final assembly lines.

Tire rims, tires and wheels are handled by overhead chain conveyor from storage through assembly, and finished wheels are carried to the final car assembly lines on another overhead conveyor 840 ft. long moving at a rate of 24 ft. a min. At the end of the lacquer department, finished hoods are hung endwise from the inside of the louver on an overhead chain conveyor and thence are delivered to the proper point along the final car assembly lines.

The conveyor for chassis sheet metal parts, already referred to, transports front and rear fenders, side splash guards, radiator dust pans, gas tank covers and trunk racks from the enameling department or the lacquer department through the storage department on the third floor to the final car assembly lines on the second floor. In the course of its journey it travels in three floors of three buildings. Passage through the storage department makes possible the removal there of rejected parts and the substitution in the blank spaces of new parts taken from storage. If the conveyor is delivering material to the assembly lines too rapidly, parts are taken off in the storage department to await demand.

Frames Assembled on Slat Type Conveyor

On the first floor of the final car assembly building, automobile frames, which are purchased from an outside source, move by hand along a metal table where running board brackets are fastened to the frames. At the end of the table the frames are lifted by an electric hoist on to a conveyor, which carries them at an angle of

PISTONS Are Handled on Roller Conveyor Just Wide Enough to Accommodate a Piston. Rollers are made of ¾-in. standard pipe

15 deg. to the second floor. Here springs and axles are added while the frames are upside down and the conveyor passes through a spray booth where the frames are given a coat of paint. At the end of the conveyor, frames are turned over into an upright position by means of a mechanically-operated hook. The frame conveyor is of the double-chain slat type with structural uprights 30 in. high to carry the frames.

There are four parallel final assembly lines, which are served by conveyors somewhat similar in construction to the frame conveyor. These conveyors have chassis stations between which are steel flights where operators can work. They are designed to accommodate any length chassis having a wheel base ranging from 109 in. to 135 in. It is along these two final assembly lines that the body, wheels, sheet metal parts, bumpers, and other small parts are added. Cars move down the first two lines and back along the third and fourth, actually being carried backward in the latter case. During the last 50 ft. along the third and fourth lines, the motor of the car is started and it is backed under its own power off the conveyor and on to an automatic elevator, which lowers it to the first floor. At the point where cars move under their own power, an overhead exhaust system has been provided to remove fumes.

Cars Move Down "Doll-Up Line"

On the first floor the cars are towed on a "doll-up" conveyor by drag chain, where they are rigidly inspected and polished and where any minor blemishes are removed.

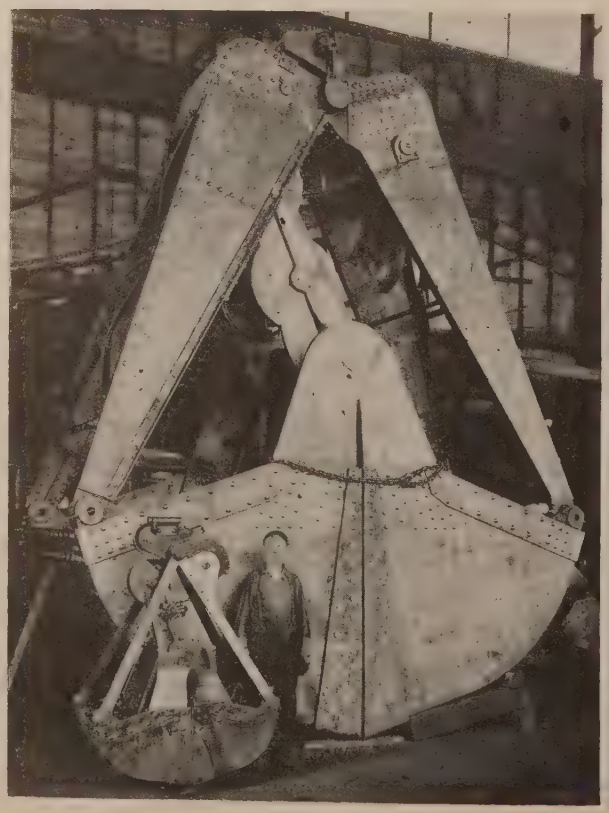
Installation of conveyors has resulted in expanding the use of old buildings and in concentrating manufacturing operations in a floor space in which heretofore it was impossible to produce more than 400 instead of the present 900 cars a day. Moreover, labor costs have been cut down about 15 per cent.

The conveyors on which motors are assembled and then are transported to the final assembly lines were designed and installed by the Jervis B. Webb Co., Detroit. The frame conveyor and the conveyors for the final assembly lines are the products of Mechanical Handling Systems, Inc., Detroit, while the conveyor delivering sheet metal parts from the enameling and lacquer departments to the final assembly lines was built by the Anchor Steel & Engineering Co., Detroit.

Action of Inhibitors in Pickling Solutions

CERTAIN inhibitors reduce the rate of solution of metals in acid solutions. F. N. Speller, metallurgical engineer, National Tube Co., in an address Dec. 28, 1928, before the American Association for the Advancement of Science said that this is due to an increase in the hydrogen overpotential, which is generally assumed to be due to formation of a film of discharged inhibitor substances adsorbed on the cathodic areas. The theory of inhibitor action has been well stated as follows:

When immersed in acid, iron goes into solution at the anode areas, forming ions and discharging hydrogen ions at the cathode areas. These cathode areas may be said to occur principally in the narrow spaces of the grain boundaries in steel, or between the metal and slag in wrought iron. Most inhibitors are either bases, such as quinoline, or positively charged colloids, and when these are present they travel to the cathode areas with the hydrogen. When the positively charged heavy particles are discharged, they cannot escape by gaseous evolution and accordingly are adsorbed on the surface, building up a protective layer.



Clamshell Bucket Takes 10 Tons of Coal at a Time

A CLAMSHELL bucket of 16½-yd. capacity has been shipped by the G. H. Williams Co., Erie, Pa., to the Donner Steel Co., Buffalo. At one grab it picks up 10 gross tons of coal. Alongside it, in the picture, is shown a Williams ⅜-yd. clamshell.

From the bottom of the scoop to the top of the head, the big coal bucket measures 18 ft. 9 in. in height. When it is lowered, open, upon a pile of coal, its scoops have a spread of 19 ft. The area covered by the spreading scoops is 133 sq. ft.

It was designed especially to increase the capacity of a crane already in use on the docks of the Donner Steel Co. The designers are proud of the fact that it weighs only 28,000 lb.

The bucket is of the four-rope type, which gives the operator positive control, even on a high bridge crane, where the bucket must be lowered a considerable distance. The twin-power-arm design serves to prevent cable twisting, and also eliminates "side leads" of closing cable. The closing line sheaves on each of the twin-power arms work always in the one plane, giving a straight-line pull. This is calculated to save wear on sheaves, flanges and bearings, as well as cable.

Assessing Obsolescence of Patterns

Methods of Determining When They Are No Longer Likely to Be Required —Periodic Survey Suggested

PERHAPS the most common procedure has been to cull out obsolete patterns whenever the storage space has become cramped. This method does not provide an efficient solution to the problem. A review of the more effective methods reported by some of the companies cooperating in this survey may be helpful.

Drives to Eliminate Patterns

Falk Corporation has on occasions made periodic drives to eliminate some of its patterns. It found that invariably after this procedure it ran into difficulties, as its customers shortly afterward ordered castings from the patterns which were discarded.

De Laval Steam Turbine Co., on its last drive to eliminate some of its obsolete patterns, destroyed a large pattern. Six months later this pattern was called for and had to be replaced at a cost of $1,500.

National Cash Register Co. disposes of its obsolete patterns, because the company finds that the cost of remaking the few patterns which may be called for later is less than the storage costs would be if all were retained.

One of the plants of Ingersoll-Rand Co. has found it better business occasionally to replace a pattern which has been destroyed than to invest thousands of dollars in storage facilities for patterns that are not moving. The greatest care is exercised before any pattern is destroyed, and it has been found necessary to replace only a few.

Definite Time Interval

Some companies have adopted a definite time interval of inactivity of the pattern before it is to be destroyed. This procedure is rather precarious, although it has proved a satisfactory solution to the problem in individual instances.

E. W. Bliss Co. destroys all patterns which have not been used in five years. The company also gives consideration to the advisability of destroying some which there is reason to believe will not be used again, even though they may not be five years old.

R. D. Nuttall Co. disposes of all patterns not used by it for ten years. Before destroying a pattern, however, the company makes a careful study to ascertain if there is not a possibility of revising it to meet later requirements.

I. P. Morris Corporation recently established the ruling that patterns not used for five years are to be destroyed. On some of the largest of its turbines, on which the pattern cost is relatively small as compared with the ultimate cost of the product, and for which there is not likely to be any demand for duplication or replacement for at least two years, the patterns are destroyed as soon as all castings made therefrom are machined and tested. The firm has found, after a period of six months in which this ruling has been in effect, that there has resulted a reduction in pattern storage area of 75 to 80 per cent.

This is the concluding installment of the article "Obsolete and Inactive Patterns," the first portion of which appeared in THE IRON AGE of July 25, page 215.

Another method is to have the engineering department or the sales department make the final decision as to the disposition of the patterns. Every ten years the Brown & Sharpe Mfg. Co. reviews all of its patterns which have been inactive during that period, and destroys those decided upon after proper consideration by its engineering department.

Builders Iron Foundry examines its patterns at least once a year, at which time it discards all those which are obsolete. In this process, the salesmen are consulted on those patterns in which they may be most interested. The effort is on the side of having too few rather than two many patterns, but in practice the firm has found a good many that do not pay by their use for the space occupied.

Sometimes there are in an organization one or two members fully qualified to take action on the patterns; where such is the case, their decision is final. An example of this may be found in the practice of a large mid-western company which goes over its patterns annually; all obsolete patterns are immediately scrapped. The responsibility for the decision is left to the man in charge of patterns and the assistant to the president, who is thoroughly conversant with the sales and service needs.

Retaining All Patterns

There are instances where, because of the nature of a product or the policy of a company, all patterns are retained, even though they would ordinarily be classed as obsolete. Skinner Engine Co. has found it has to supply repair parts for engines which it built 25 to 30 years ago. It feels, therefore, obliged to keep all its patterns, and no obsolete classification is attempted.

Busch-Sulzer Brothers Diesel Engine Co. maintains patterns for its commercial product as long as the engines are in service. This necessitates extensive pattern storage. But since the longer a machine is in service the more likely replacement parts will become necessary, the company does not believe it is advisable for it to destroy patterns even 25 years old.

Riley Stoker Corporation has been engaged in the stoker business for almost 50 years, and has in that time accumulated a great many patterns. As long as a stoker of the firm's manufacture is in service, it feels duty bound to supply renewal parts whenever required.

Waterbury Tool Co. keeps the patterns of its regular product indefinitely, as do both Murray Iron Works Co. and De La Vergne Machine Co., since they believe it is to their advantage to be able to supply repair parts for their respective machines whenever called upon to do so.

Some firms retain certain classes of patterns, but destroy others, the procedure depending, as before suggested, upon the nature of the product. There are many instances where only specific parts of a unit would under ordinary circumstances need replacement within the life of the unit. In these cases, it would obviously be of no particular advantage to retain and store all the patterns for the complete unit.

United States Radiator Corporation, for instance,

finds it necessary to keep only the patterns of parts of its various products which are subject to wear. Years after a heating boiler is installed in a residence, an owner would resent being put to a heavy expense to replace his entire boiler simply because the manufacturer was unable to furnish a grate bar which had burned out. A grate bar of obsolete pattern, even at what appears to be an exorbitant price per pound, is an economical repair.

Buckwalter Stove Co. has found it good practice to destroy, after a reasonable period of time, all patterns for its stoves with the exception of the fireboxes and the firebox parts. B. F. Sturtevant Company destroys all patterns of any special designs which have not worked out to be salable in any volume. This aids in keeping the pattern storage space free of unproductive patterns.

When a large part of a piece of equipment fails after a number of years of service, the cost of the repair usually approaches closely the cost of a new unit. With a little calculation of obsolescence, a new sale often can be made, and the manufacturer is money ahead to encourage this transaction by making a scrap value allowance for the old unit.

Several Jobbing Foundry Methods

Several methods are pursued by jobbing foundries. One is to keep all customers' patterns until called for. This may work a hardship on the foundry, and often necessitates the foundry's requesting the customer to give permission for the return of certain patterns, which permission may or may not be given. In one such case a foundry, after the first request was unanswered, asked its customer again, this time stating that if the patterns in question were not removed by a specified date, they would be put outside. This method obviously is poor practice. It not only causes the foundry to stand a large share of the burden of storage but also presents possibilities of unpleasantness with customers.

Another method adopted by some foundries is to have an understanding with the customer that all patterns not active will be retained without charge for a definite period of time only. After the expiration of this time, and upon notification by the foundry, storage charges are made to the customer for retaining his pattern. This system is found more equitable for both the foundry and the customer, and precludes the possibility of difficulties which may arise when no time limit is placed upon the storage of customers' patterns.

Reclassification

The practice of the Barber-Colman Co. gives an interesting example of the reclassification system for the handling of obsolete patterns. In its pattern storage the company has reserved certain shelves for obsolete patterns. At intervals of three years these patterns are checked by the engineers interested, who decide which patterns are entirely useless and those that may be needed at some future date for making castings for repairs.

Patterns which are found to be entirely useless are destroyed, and patterns which there may be occasion to use are packed in large boxes and the boxes stored in a space in the warehouse assigned for this purpose. Each box of patterns is given a number and a complete record of its contents is made and kept for reference, so that whenever need for one of these patterns develops, it can readily be located and used, after which it is returned to its box.

George D. Roper Corporation classifies its patterns as (1) Active; (2) Inactive; and (3) Obsolete. The inactive patterns are stored with the active patterns and occupy about twice as much space. They are considered inactive because they are used only for furnishing repairs, and some of them are almost 20 years old. The obsolete patterns are stocked in a separate space and kept for their salvage value. This space occupies about one-fifth the space required for the active patterns.

Fairbanks, Morse & Co. remove their patterns to their service department pattern storage as soon as a product is discontinued. The warehouse is checked two or three times a year, and as many patterns are disposed of as possible.

Card System

A system which has many valuable features is a card index of all patterns. When properly applied, this is reported to be of inestimable value in solving the obsolete pattern problem. Allis-Chalmers Mfg. Co. maintains in its pattern shop a card index of all patterns. On each card it posts the date the pattern is taken out of storage and used in the foundry, as well as the date it is returned to storage. The cards act as a guide to the activity of the patterns, and lists are prepared several times during the year, showing patterns which have not been used during a period of approximately five years. These lists are then forwarded to the various engineering departments for their recommendations as to whether the patterns are to be retained in storage or destroyed.

It does not necessarily follow that any pattern which has not been used during a period of five years is to be destroyed, as the engineers who make the decision may consider the pattern to have sufficient prospective value to justify the expense of continued storage. The period of inactivity, therefore, is not the sole consideration, as the engineers, familiar with all the factors involved, must weigh the going value of the pattern against the cost of storage, as well as the company's obligation to its customers in furnishing repair parts.

Link-Belt Co. also has inaugurated a card system for use in its pattern vaults. The form of card which this company uses is shown in Fig 1. It will be noted that this card carries a full description of the pattern, covers the question as to whether it is wood or metal, and lists all core boxes and loose parts. It also gives data as to the location of the pattern, so that anyone wishing to use the pattern can readily find it by referring to this card. At the bottom of the card is a record which indicates not only the location of the pattern at all times, but also how often the pattern has been used over a given period of time. Thus at the end of any interval, the cards can be reviewed and decisions made as to which patterns to retain, and which ones can be scrapped.

Isbell-Porter Co. maintains a somewhat similar system, using the information contained on the cards in much the same manner as above. The card used by Isbell-Porter Co. is illustrated in Fig. 2.

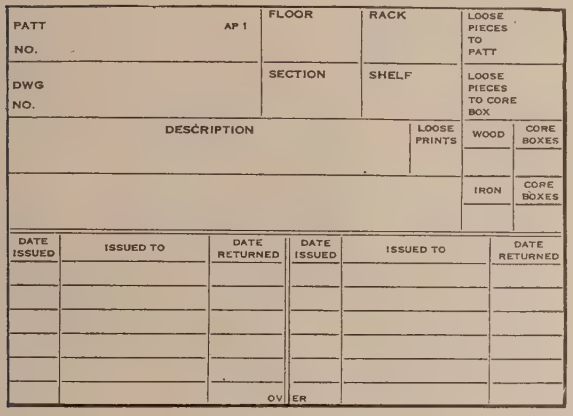
Periodic Survey

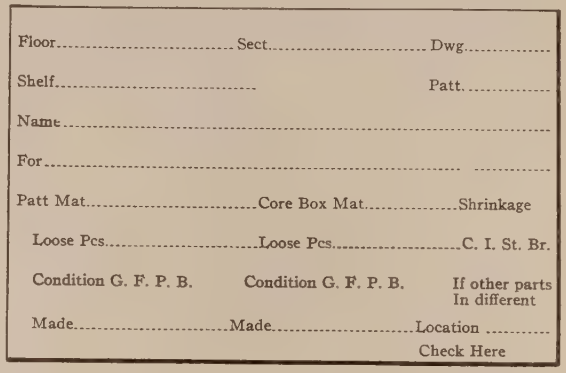
Numerous companies make periodic surveys of their patterns in storage, to determine which are obsolete and can be destroyed. Several methods are in use. One is to review the records of the various patterns to ascertain their activity. This is usually done either by a special representative who is familiar with the patterns, sales and production, or jointly by members of the sales and engineering departments who are fully acquainted with all the factors involved.

National Cash Register Co. makes semi-annual inspections of all its patterns not in actual use, and which have not been used during the previous six months. These are then laid aside, and all patterns for which there has been no call during the year are passed upon by the Inspection Committee. This committee consists of the men in charge of the pattern, foundry, general machine, tool room and tool supply departments. They are familiar with the requirements and are in a position to determine whether the patterns will be used in the future. The pattern is scrapped when the committee so decides.

The procedure followed by Morgan Construction Co. presents an interesting example of the application of this method, used in conjunction with a card system. The company places full responsibility for its pattern policy in its Pattern Committee, which is composed of the general superintendent, chief draftsman, a designer, pattern shop foreman, pattern records and storage man, and the treasurer of the company. The committee meets at least once a month. It takes into consideration three factors in determining the obsolescence of the patterns:

1. Notification by the engineering department of a change in design.
2. Inactivity of a pattern for five years. This is determined by reference to the pattern record cards.





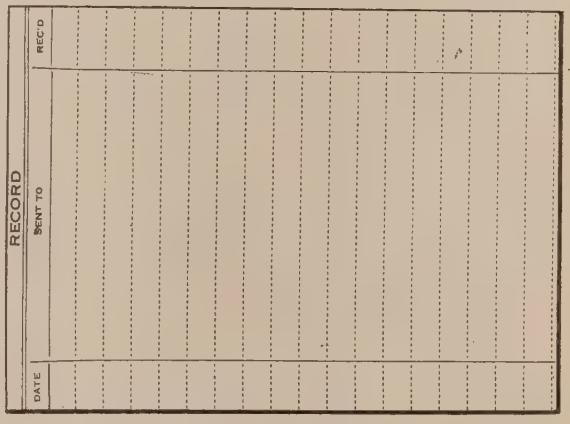


FIG. 1—Link-Belt Co. Card (Above) for Patterns in Storage. The back of the card duplicates the lower half of the front (here shown), thus providing space for recording many instances of use

FIG. 2—Isbell-Porter Co. Uses This Card (at right) to Keep Records of Stored Patterns

3. Notification from pattern storage department of irreparably poor condition of a pattern.

Pattern record cards covering about 200 patterns are reviewed by the Pattern Committee. Notations are made on the cards through the use of two rubber stamps, one reading "Scrapped" and the other "Reviewed." The latter stamp indicates the decision of the committee to withhold scrapping the pattern until a later date. In every case where a pattern comes before the committee for consideration, dating stamp bearing the meeting date is imprinted next to the stamp showing the committee's decision.

Following the meeting, the record cards of patterns which have been declared obsolete by the Pattern Committee are turned over to a secretary, who prepares notices to be sent to all customers who have previously had castings made from the patterns in question. These are sent out with a statement that the patterns have been declared obsolete, and giving the customers an opportunity to purchase spares or castings from the patterns within 30 days after the date of notice. This procedure avoids in large measure the possibility of scrapping a pattern one day, and receiving an order on the following day for a casting from the pattern. Records of the Pattern Committee from 1924 to May 18, 1928, indicate a total of 8959 patterns scrapped during that period.

Rare Metal Columbium Now Available

At the recent Exposition of Chemical Industries in New York, the first metallic columbium made in the United States was exhibited by Dr. C. W. Balke, chemical director of Fansteel Products Co., North Chicago, Ill. Columbium, it will be remembered, is a rare metal similar in many ways to tantalum, which also was first produced in America by Dr. Balke.

Like tantalum, columbium is inert to practically all chemical action, and is soluble only in a mixture of nitric and hydrofluoric acids. In electrolytes the metal is unidirectional. It readily absorbs gases by occlusion, and has been patented as a "getter" in vacuum tubes. Columbium is very ductile and is easily worked cold. It may be rolled, drawn, hammered, formed or cut with ordinary metal-working tools. It welds readily to itself and other metals by the spot welding process. However, the metal must not be subjected to any great amount of heat in atmosphere, or it will become brittle.

Except for about a half-ounce made by Siemens in 1906, the Fansteel exhibit represented, it is asserted, all the metallic columbium in the world. The exhibit consisted of several pounds of the metal in sheets, bars, rods and wire.

There are workable deposits of columbite in the black hills of South Dakota, and the ore is also found in several other places on the North American Continent. In value, the metal is about one-seventh the price of platinum, and about half the price of gold.

Building Machines of Welded Steel

Has Advantages for Equipment Infrequently Ordered, and as Step in Developing New Lines—Cast Construction Economical for Machines Produced in Quantity

BY D. M. LUEHRS*

A GREAT deal has been published in the technical press relating to the substitution of welded-steel for cast-iron and cast-steel construction. Much of the work described, such as shears, concrete mixers, cranes and crane runways, has been of comparatively simple design and has involved very little attempt, even by the designer in cast metals, to produce really pleasing looking as well as highly efficient equipment. The majority of machine designers are perhaps unaware that welded steel can be embodied in the construction of machine tools and still produce a machine of pleasing appearance, eliminating square corners and brackets upon which workmen may accumulate waste, oil cans, etc.

*President, Luehrs Co., designer and builder of automatic machinery, Fostoria, Ohio.

Attempts have been made by some promoters of welding to substitute welded-steel construction wherever cast metal is used. That is an impractical proposition. The company with which the writer is connected has been building machine tools and other machinery of welded steel since 1914 and has had numerous opportunities to determine where welded steel leaves off and cast construction begins.

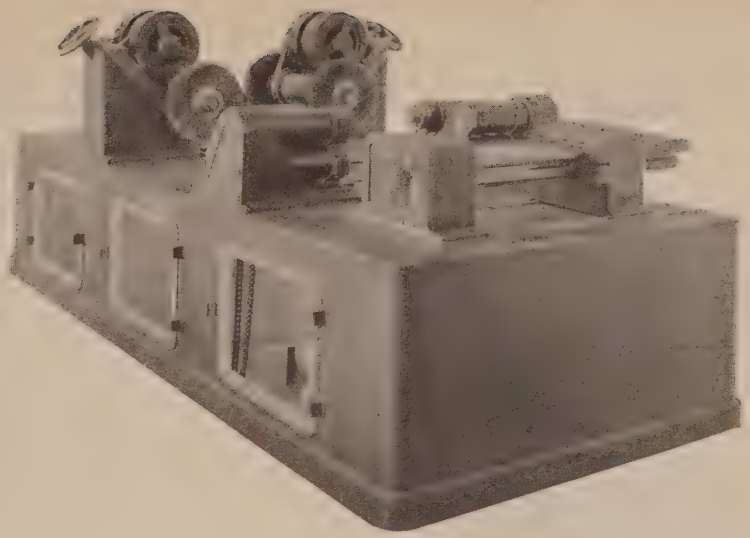
Welded steel construction is ideal for special machines, only one or two of which are to be built. It is also of advantage in building the first standard machine of a new design, or for building standard equipment, especially of large size, for which orders are received only once or twice a year.

In the case of the special machine there is always more or less development work during the entire construction period. Machine designers are not infallible and numerous alterations usually have to be made in the design. It costs practically as much to build a set of

FIG. 1.—Welded Steel Was Used in Building This 8-Ft. Diameter Indexing Table Designed to Carry Jigs for Work Done at Three Different Stations. Production of six pieces a minute is required and so the table must be indexed 18 times a minute. To get the necessary stiffness and sufficient wall thickness, this table, if of cast construction, would be too heavy to index at the speed required without the use of accessory equipment to accelerate and decelerate. Built of welded steel, thoroughly braced and ribbed, and carried by a Timken precision roller bearing, the table can be turned readily with one finger

FIG. 2.—This Special Milling Machine Combines Welded and Cast Construction. The base, hydraulic platen or table, hydraulic vises, hold-downs and milling arbors are of welded steel, but because the same set of patterns could be used for both the right and left-hand head and tailstocks, steel castings were used for those parts. The tailstock castings are electrically welded to the tubular overarms that tie the head and tailstock together

FIG. 3.—(Below) Welded Steel Was Used Economically in This Machine, Especially for the Overarm Supporting the Wire Straightener, the Rack Frame Guides and Gear Boxes. The machine was designed for feeding wire, straightening and cutting it to length and welding it to form the rectangular oven rack for gas ranges. The door frames and doors and the two handwheels shown on the machine are castings



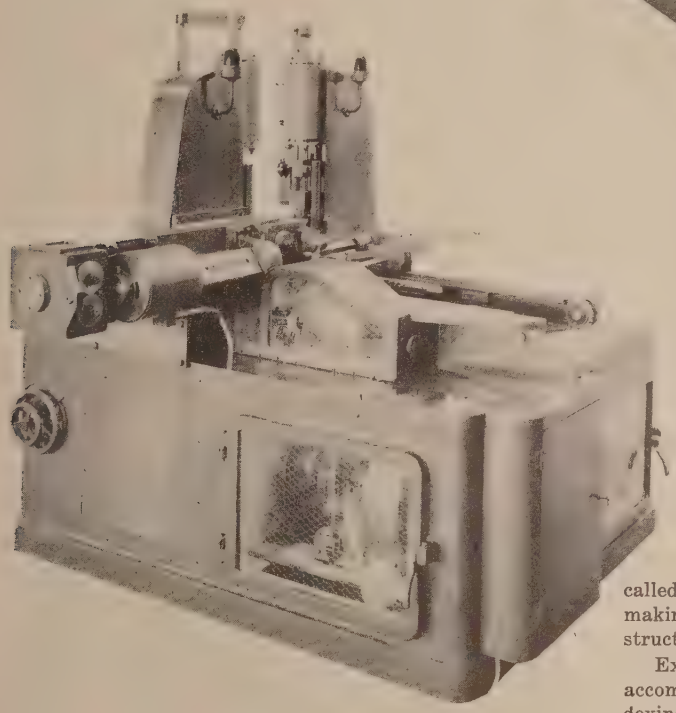


FIG. 4.—(Above) The Welded Steel Base of This Machine, for Finishing Operations on the Gas Range Oven Racks, is 5-Ft. Wide and 12-Ft. Long. Of welded steel also are the gear boxes that support the roll straightener, the housings and parts, and the rotary shear. The two triangular base supports for the wire brushes are identical in design and were therefore made of castings. The door frames being of standard size are of cast steel, welded into holes burned into the steel plates

patterns and core boxes as it does to perform the welding operations on the machine itself. Patterns deteriorate rapidly, require fire-proof storage, and unless another machine is going to be built from the same pattern within six or eight months, patterns can be eliminated with considerable speeding up in production and a reduction in the weight and cost of the material. Other advantages include increased stiffness and strength, smoother finish, requiring less paint, and the elimination of the necessity for "aging" the material.

In developing a standard machine of new design, welded-steel construction offers the same advantages. In addition, it permits the welding on of brackets and pads and the making of changes without scrapping and remaking the patterns and castings. Having completed the development work and having determined just how the proposed machine will function, it is, of course, more economical to put the machine into patterns and get the castings in the regular way. Modern heat-treating largely takes care of the aging problem.

When a large machine tool is to be built only two or three times a year, deterioration and repairs to patterns become quite costly. Large castings are relatively hard to handle and of necessity must be thicker, hence heavier and more costly, in order to obtain the same strength as with the steel construction. With very large equipment of this class, changes in design are frequently called for to fit the machine to particular requirements making it necessary to add considerable pattern construction to the job.

Examples of welded-steel construction are shown in the accompanying illustrations. Fig. 1 is an 8-ft. diameter indexing table; Fig. 2, a special milling machine representing a combination of cast and welded-construction; and Fig. 3 is a machine for feeding wire, straightening and cutting it to length and finally welding it into a rectangular gas range oven rack. Fig 4 is a machine for finishing operations on the gas stove oven-racks. The captions for these illustrations give further data on each machine.

In building these machine bases, the plates are planed and scarfed on a plate planer. The molding around the base is also planed and one edge rounded, on the plate planer. All welds are caulked immediately after welding to remove any strains that may be set up by the welding heat. We find no difficulty in obtaining welds free from porosity, and have never had a weld fail.

Proper equipment, proper welding wire and a high-grade experienced welder are the prime essentials to success in obtaining good welded steel construction.

A directory of mine operators and statistical data pertaining to shipments of iron ore are contained in a booklet published by the Lake Superior Iron Ore Association, Cleveland. Included in the data are annual shipments from each mine in the period 1909-1928 inclusive, annual receipts at lake ports, ore on dock at Lake Erie ports, annual shipments from other than Lake Superior mines and annual imports by countries.

New Low-Sulphur Iron for Ingot Molds

Effort to Avoid Cracking of Molds from Sudden Expansion and Slower Contraction—Oxides Blamed for Permanent Growth

DEVELOPMENT of an ingot mold iron to resist, as much as possible, the failure of molds through heat checking and cracking has been the purpose of the Vulcan Mold & Iron Co., Latrobe, Pa., in bringing out a new metal which is designated as Vulc-Iron. Specializing particularly in the ingot mold requirements of tool, alloy and other high-grade steel producers, the company has used cupola-melted, rather than direct-metal, iron in casting its molds, to obtain a smooth surface and also to minimize cracking from the wide temperature fluctuations during the early life of the mold.

Development of Vulc-Iron is the culmination of several years of experimenting to determine the cause of heat-checking in ingot molds, and the entire output of the company is now being made of this metal.

Causes of Heat-Checking

Cast iron, as is now generally known, is made up of steel matrices interspersed with graphite flakes. During the heating and cooling that an ingot mold undergoes in service, the cast iron expands and contracts according to the heat laws. As the coefficient of expansion of the steel matrix is higher than that of the graphite, the steel expands more rapidly, leaving a cavity around each graphite flake. Near the surface of the mold these cavities will permit oxygen and other gases to penetrate and oxidation takes place at or near the surface of the mold.

Photomicrographs clearly show evidence of oxides surrounding the graphite flakes. These oxides, being of greater volume than the elements oxidized, partially fill the cavity formed during the expansion that takes place when the hot metal is poured into the mold; when the mold cools and contraction occurs, the metal cannot shrink back to the original volume. A permanent growth of the iron is recorded, this apparently being the cause of a large percentage of the failures in molds.

Controls Size and Distribution of Graphite

Checking of this growth of the ingot mold metal during cooling has been attempted in Vulc-Iron by reducing the number of graphite flakes in the iron and by making them smaller and more rounded in form. This would also bring about a lessening of the distance between the graphite flakes and reduce the penetration of oxygen by stopping the open paths used by the gases.

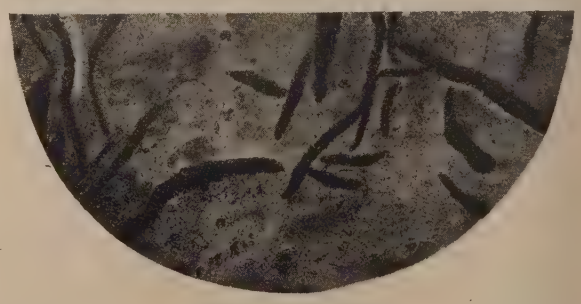
Accompanying photomicrographs show the difference in structure between Vulc-Iron and ordinary cupola cast iron. Tests of molds in service have shown the growth-resisting qualities of the former and the consequent reduced fire cracking.

High percentages of sulphur in cast iron tend to increase its brittleness and lead to cracking at both high and low temperatures. Hence, Vulc-Iron is treated to reduce its sulphur content. It averages 0.035 per cent sulphur, and is guaranteed under 0.05 per cent sulphur. Only Bessemer iron is used in the cupola, with a percentage of low-phosphorous steel scrap and of cast iron scrap, the latter entirely of the company's old molds, returned for this purpose. Washed coke is burned in the cupola and desulphurizer is used freely.

Improved Service Demonstrated

Tests of the molds in plants show an average improvement in service of about 25 per cent over regular or direct metal ingot mold iron. In a number of cases it has been found practical to reduce the wall thicknesses of molds by the use of this metal, without allowing them to fail by breaking or cracking. As a good many molds in use today have a greater wall thickness than is necessary to produce the required amount of chill on the ingots, the excess thickness being required to prevent cracking or breaking, efforts are being made to develop the po-

DIFFERENCE in Structure of Vulc-Iron (upper) and Ordinary Cupola Cast Iron (lower) Is Shown in the Photomicrographs, Magnified 100 Times. In the Vulc-Iron, the graphite flakes are greatly reduced in size, providing a much finer granular structure



tentialities of Vulc-Iron to the fullest extent in this direction.

It is believed also that this metal may provide sufficient strength in the mold wall to resist cracking without a redesigning of molds in cases when molds are not strong enough to withstand the sudden expansion occasioned by the pouring of the steel.

New All-Metal Construction Principle

Portable Buildings Put Together With Special Key Device—Some Electric Welding Done

BY R. A. DADISMAN*

IN the wake of the all-metal house movement comes a new development in portable all-metal building construction, conceived and designed for the White Castle System, Inc., Wichita, Kan., by Lloyd W. Ray of their construction department. This suggests the possible application of the idea to other types of commercial and industrial buildings.

No rivets are used in the construction of the supporting structure or the inside or outside surface joints, and yet the building can be knocked down and reassembled in a few days, with no tools except a pair of pliers, a wrench and a screw driver. The entire structure with interior fixtures in place weighs about 8000 lb.

The White Castles are fireproof, are protected inside and out from deteriorating weather conditions, and can be initially built for about one-fourth less cost than the glazed brick buildings formerly used by this company. So versatile is this new type of construction that the building will fit a variety of corner sites. This is because the doorways and doors are interchangeable, so that the door may be placed at the end or the side, and it can swing open to the right or left, without any change in specifications.

For several years the White Castle System had been searching for a movable, attractive and sturdy type of all-metal construction which would replace the brick structures in use for the company's chain of stands. The only thing to be had was constructed in the traditional manner, riveted together, so that it was practically impossible to move it economically. And there were exposed rivet and bolt heads, and it could not take the attractive finish so much desired. The key to the problem was really a mechanical key—a locking device which eliminated the use of rivets or bolts, and was completely hidden from view. And yet it bound together the proposed all-metal building as solidly as the best hammered rivet might have done.

Since there were no dies in existence for making the steel studding to meet the specifications, the entire job had to be done from the ground up. In Fig. 1, showing the assembled superstructure, the eight sections composing this framework are indicated by vertical lines on both the lower and the upper track. Each corner is a section, with an intermediate section in the front, at the rear, and at each end. Each section is built up by welding the studding into the upper and lower track. Only two sizes of steel studding are used.

Frames for windows, doors and transoms are bolted in and easily removable, so as to fit the specific needs of the ultimate location of the building. The only wood used is a "breaker" of wood strips on the inside of the studding. This serves as an insulator between the two sheetings, eliminating actual metal contact between exterior and interior of the building, further insulating against the weather and preventing the possibility of "sweating."

How the interior and exterior porcelain-enameled Armco ingot iron sheets are secured without the use of

*American Rolling Mill Co., Middletown, Ohio.

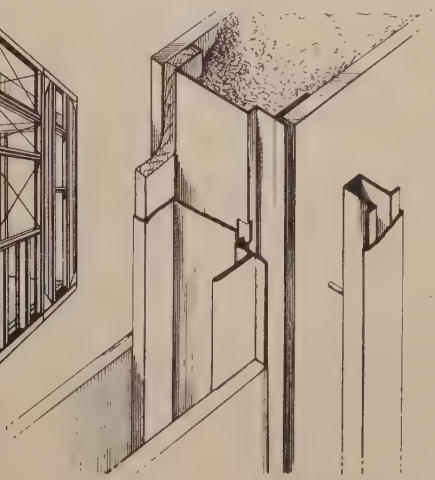

FIG. 2

FIG. 3

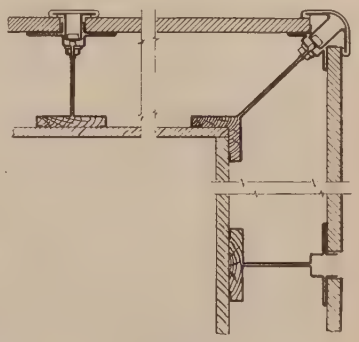

FIG. 4

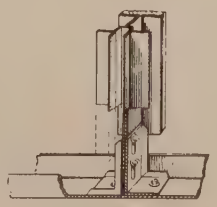

FIG. 5

rivets, bolts or other methods commonly used in metal construction is shown in the cross-section view of studding, Fig. 2. Exterior sheets are secured to the studding by a locking key as shown at right in Fig. 2. The key cover, built to fit snugly over the flanges of the key, is also porcelain enameled, leaving the exterior of the building without any evidence of the manner of fastening the sheets to the framework.

Interior sheets are cut so that they meet at the wood strips inserted in the studding, and are secured by screws directly into the wood. Joints between sheets are then covered with a nickel molding strip, also screwed into the wood. Insulation in the 4-in. space between exterior and interior walls, shown in Fig. 2, is asbestos rock wool.

Final assembly of all these units of construction is shown in the cross section view, Fig. 3. How the key appears when set in place is shown in the upper left and at the corner section in this drawing. Fig. 4 shows the method of securing the movable and interchangeable framework for doors, windows and transoms.

Ascendency of Alloy Iron Castings

Automobile Companies the Largest Users—Great Deal Made from Mayari Pig Iron—Output in 1928 Over 700,000 Tons

BY EDWIN F. CONE

IN a survey of the alloy iron casting industry of the United States, entitled "Ascendency of Alloy Iron Castings," published in THE IRON AGE, March 28, pages 861 to 863 and 924, it was promised that a brief supplementary article would be published later because further returns from the questionnaire were expected. In the following paragraphs some pertinent facts, not ascertained up to the time the earlier data were analyzed, have been furnished by a few other producers of alloy gray iron castings.

The original questionnaire had been sent to 3813 foundries. At the time that article was written, replies had been received from about 1900 producers, or nearly one-half of all of them. Since then the number has expanded to 1988. It is assumed that practically none of the 1825 silent foundries make alloy gray iron.

Large Tonnage Used by Automobiles

An interesting feature of the use of alloy gray iron castings is their application to automobiles. Nearly 30 leading automobile makers were canvassed and of these 22 were heard from directly. Fifteen manufacturers do not make their own iron castings. One automobile maker who uses nickel-chromium cylinder heads and other castings on a large scale did not reply. Estimating that company's production and adding it to the output of the companies which gave their production, there was produced in 1928, by automobile companies having their own foundries, approximately 200,000 tons of alloy gray iron castings, containing either nickel alone or nickel and chromium. The large part of this total was made by the use of Mayari pig iron. It is of interest to note that one maker of a leading high-priced automobile made over 14,000 tons of semi-steel castings, principally cylinder blocks and cylinder heads.

Another large outlet for alloy iron castings is in the form of rolls for various types of rolling mills. Replies from seven companies producing such rolls containing nickel, chromium or molybdenum, or combinations of these, indicate that about 15,000 tons was made in 1928 by these companies.

Wide Use of Mayari Pig Iron

Due to some misunderstanding of the original questionnaire, a large number of makers of nickel-chromium castings did not report the sources of the nickel and chromium. It develops that a larger proportion of this grade of iron castings is made by the use of Mayari pig iron than was at first suspected. According to data furnished by the Bethlehem Steel Corporation, approximately 600,000 tons of gray iron castings were made from Mayari pig iron sold by that company in 1928, the castings containing widely varying percentages of nickel and chromium and the uses to which they are put being also very much diversified.

In this connection attention is called to the fact that the use of nickel in cast iron was suggested as early as 1858 by Sir William Fairbairn. Its essential benefits to gray iron were described by Guillet in 1907. No industrial development, however, took place based upon the experiments of these two pioneers, on account of the high cost.

Early in 1912 the Pennsylvania Steel Co. experimented with a Cuban ore and made a number of tests of iron containing varying amounts of nickel and chromium. In the same year the Reading Iron Co., Reading, Pa., purchased some Mayari pig iron for pipe balls. Attention was attracted to the wear-resisting properties of these balls. Other tests were made by S. Jarvis Adams, and in 1913 J. Ramsay Spear was granted a patent covering the use of these alloys. Mayari pig iron was coming into use in the making of rolls for steel mills at that time.

Purchase of the Pennsylvania Steel Co. by the Bethlehem Steel Co., in July, 1916, placed the Mayari properties in the latter's possession. The Bethlehem company began actively to develop this special grade of pig iron into a commercial product. Up to that time only six or seven firms were using it and only in the low-silicon grades for wear-resisting uses; it was during the post-war depression, or from 1919 to 1921, before the commercial application of nickel was advised for use in gray iron castings. Mayari pig iron, by this time, it is stated, had been used by many foundries interested in improving their product, but development was slow until the motor car makers began to use it in quantities in an effort to produce better cylinder blocks. Today, as the above survey indicates, this iron is used by a large number of American automobile manufacturers, and also by European car makers.

Opinions of Foundrymen

Supplementing some of the views of various foundries, given in the original article, the following are important:

One company in the East states that in 1928 it made a large tonnage of vanadium iron castings, for "use in machinery in places where superior tensile strength is required and where a casting has to withstand friction, such

as cams, etc., and for extrusion, tool and die purposes, where it is essential that the metal will not run nor score. Castings are heat treated in such cases where they must be a little softer than in the natural condition."

A large railroad, which has its own foundry, says that its output of over 1150 tons last year was made with a mixture of two grades of pig iron, two grades of scrap iron, four grades of scrap steel, ferromanganese and No. 44 nickel alloy. "Fifty per cent of this tonnage was a high-grade alloyed iron for locomotive cylinders, cylinder bushings, cylinder packings, valve bushings, valve packings, piston heads, valve rings, piston bull rings, and other locomotive parts."

A large foundry and machine company reports that last year it made about 200 tons per month of molybdenum and other alloy iron rolls.

Significant information comes from a producer, on a large scale, of corrosion-resisting cast iron pipe and sections made from nickel-chromium alloy iron, meaning evidently Mayari pig iron. The metal was produced in two cupolas, one of the conventional design and the other fired by powdered coal, the iron being superheated in both units.

A maker of one of the leading high-grade automobiles estimates that he produced, last year, about 5000 tons of cylinder block castings containing from 1.25 to 1.50 per cent nickel, about 1000 tons of pistons containing 1 per cent nickel, and one or two smaller jobs of about 500 tons, in which 1 per cent nickel was used.

A Western company, which produces agricultural implements, offers the following testimony: "We have just recently been experimenting with the use of nickel and chromium in our iron castings. We have not progressed far enough to give any definite information, other than that we receive fairly good results with the use of these two alloys in castings for cylinder heads and gears."

From a company located in the Eastern States, the following experience in making and testing alloy gray iron castings is reported:

From two test pieces that were made in our foundry, using alloys, the piece tested was cast as a riser on a casting. The first castings weighed approximately 500 lb. and were rather chunky. They were cast from a mixture consisting of 20 per cent foundry pig iron (silicon 2.01 per cent), 40 per cent cast scrap and sprues and 40 per cent steel scrap. The analysis was:

Total carbon	3.45	per cent
Phosphorus	0.396	per cent
Manganese	0.58	per cent
Sulphur	0.116	per cent
Silicon	1.43	per cent
Nickel	0.81	per cent
Chromium	0.14	per cent

Nickel and chromium used in ladle.
Tensile strength 36,500 lb. per sq. in.

The second castings weighed approximately 1500 lb. each and were complicated with a lot of cores and sections from ½ in. up to 1¾ in. thick. They were cast from a mixture consisting of 37 per cent foundry pig iron, 3 per cent Mayari pig iron, 50 per cent cast scrap and sprues, and 10 per cent steel scrap; 1 per cent nickel was added in ladle. The analysis was:

Total carbon	2.80	per cent
Phosphorus	0.176	per cent
Manganese	0.62	per cent
Sulphur	0.14	per cent
Silicon	1.40	per cent
Nickel	1.36	per cent
Chromium	0.09	per cent

Tensile strength, 33,800 lb. per sq. in.
Brinell hardness, 90.

This last casting was a lathe bed. The report from the machine shop was that it machined a little hard but always showed up fine.

A revision of the table of output of alloy iron castings, by States, published in the original article, accompanies this article. It shows that reports from 39 States indicated an output in 1928 of about 299,500 gross tons. Added to this an estimated tonnage of 400,000 tons from companies not heard from, and based mainly on the known uses of Mayari pig iron by a diversified number of companies, the total alloy iron output in 1928 was approximately 700,000 tons.

Output of Alloy Gray Iron Castings by States in Tons in 1928

Alabama	1,919	Nebraska	300
California	590	New Jersey	5,171
Colorado	22	New York	5,275
Connecticut	3,410	Ohio	9,283
Delaware	7,500	Oklahoma	150
Florida	2	Oregon	249
Georgia	788	Pennsylvania	36,305
Illinois	7,848	Rhode Island	300
Indiana	19,673	South Carolina	35
Iowa	3,840	South Dakota	5
Kansas	2,500	Tennessee	100
Kentucky	85	Texas	295
Louisiana	20	Utah	70
Maine	78	Vermont	1,200
Maryland	50	Virginia	5
Massachusetts	10,266	West Virginia	1,927
Michigan	158,120	Washington	706
Minnesota	6,575	Wisconsin	9,196
Missouri	1,250		
Montana	4,401	Total	299,509

Total Alloy Iron Output in 1928, 700,000

Large Assortments of Bolts and Nuts Make Warehousing a Difficult Problem

BECAUSE of the multiplicity of sizes and types which must be carried in stock, the warehousing of bolts and nuts is one of the most difficult problems for the manufacturer of these products. At the Lebanon, Pa., plant of the Bethlehem Steel Co., for example, about 12,000 tons of these products and 3000 different items are nearly always carried in stock. These bolts and nuts are stored in bins of varying sizes, some holding as much as 80,000 lb. each. Kegs of bolts and nuts are packed through openings in the bottoms of these bins. Skilled workers assemble as many as 1100 kegs a day, based on standard size No. 12½ keg, which means the handling of more than 15,000 pieces a day. The orderly and convenient arrangement of the Bethlehem bolt and nut warehouse is shown by the illustration of one bay of a building 200 x 675 ft. used for bolts and nuts only.

Hot-Metal Ladle of Spherical Shape

Many Advantages Claimed for New Type of Container—Greater Capacity Without Excessive Weight

REDUCTION to a minimum of radiating surface in a hot-metal ladle is accomplished in a 70-ton spherical-shaped ladle which has been developed by F. F. Kling, chief engineer, Youngstown works, Carnegie Steel Co. It is now being successfully used at that plant in transferring hot metal from the blast furnaces to the mixers. A number of these ladles are being introduced at the Mingo, Ohio, works of the Carnegie company also and others are being built by William B. Pollock Co., Youngstown, for a Canadian steel company.

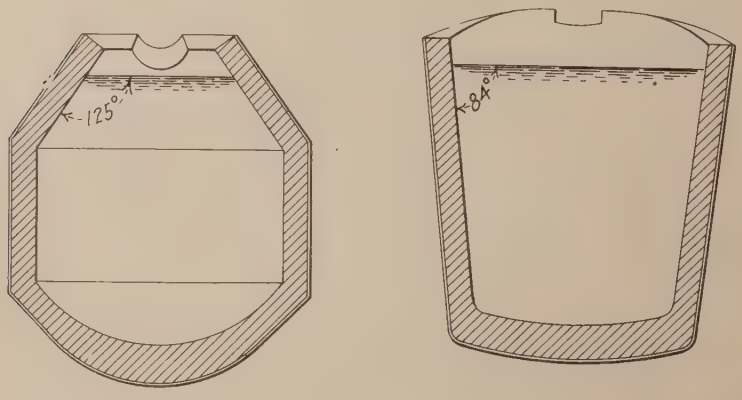
As shown in the illustration, the shape of the ladle represents a decided departure from the usual type, and the center of gravity of the metal is low. Splashing in transit is practically eliminated. The ladle is of strong construction and comparatively light in weight. It can be lifted from the car in pouring, or can be poured directly from the car, and a transfer ladle is unnecessary in pouring the hot metal into the mixer.

Ladle trunnion bushings rotate on the self-lubricating brass sleeves, thus preventing wear on the trunnions, as well as on the crane hooks. Self-lubricating bushings have been provided also on the pin which the auxiliary hook of the crane, or the hook of the pig casting machine hoist, engages when turning the ladle over.

The ladle car is of substantial construction and, because of its shortness in proportion to capacity, requires little track space. The car frames which tie the trucks together are made of 6-in. x 15-in. rolled steel slabs of high tensile strength. Self-lubricating brass washers are used on top of the centerplates of the truck bolsters, reducing wear at this point and enabling the trucks to turn easily when going around curves. The cars are equipped with draft gears and, as a safety measure, heavy safety chains backed up by springs are provided.

The Kling ladle and car may be used satisfactorily on 85-lb. rails, and trestles of usual design are strong enough to support it. Removing kish is accomplished by dumping into a box or cinder pot immediately after the iron has been poured into the mixer; it does not have to be scraped out of ladle. New lining may be put in without the use of arch supports.

In comparison with the old 20-ton ladle, the Kling type keeps the metal hot longer, and runner scrap and used ingot molds can be melted in the ladle. With hotter iron the mixers do not skull, and considerably more scrap can be used in the converters. Skull in the ladle is practically eliminated, with the exception of a small growth of kish in the spout, which is removed twice a week. Fewer men are required in the cast houses and ladle house with the larger ladle, and men are saved in cleaning ladles.



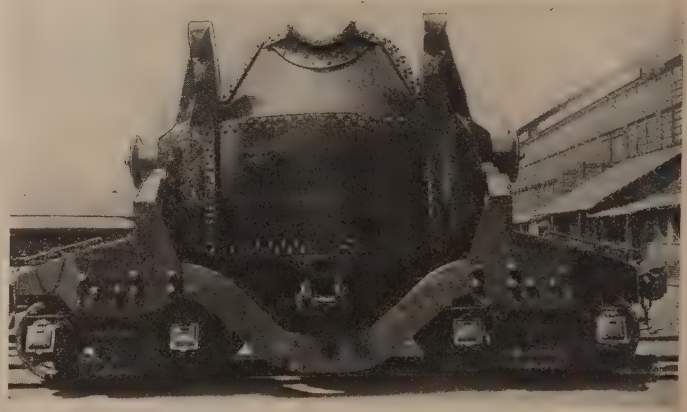
SECTION of the Kling Ladle, Compared with a Ladle of Conventional Design and Same Capacity, Shows Reduction in Exposed Surface of Metal

Range Boilers and Expansion Tanks

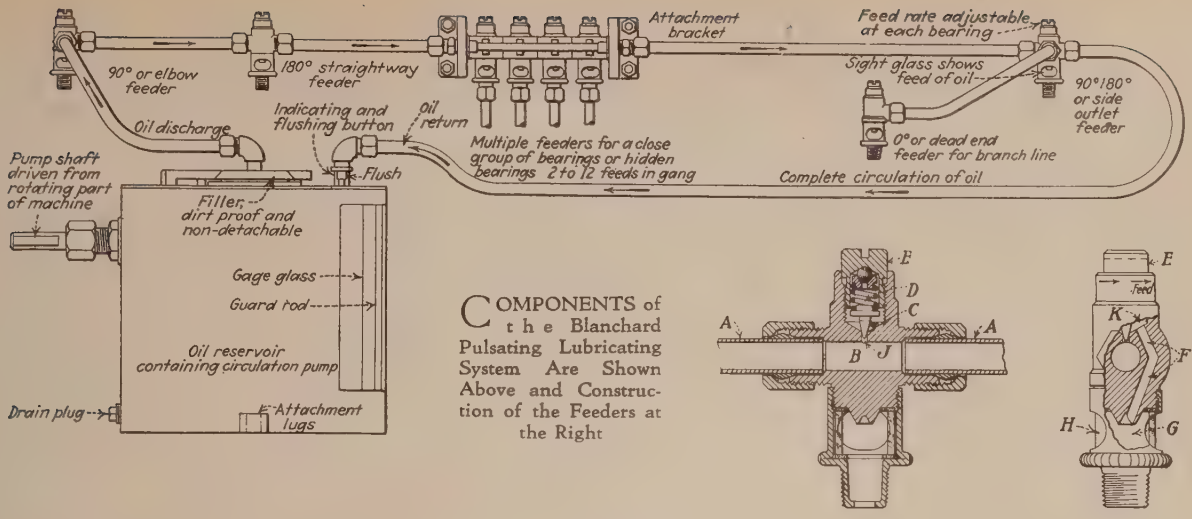
Simplified Practice Recommendation R8-29 relates to range boilers and expansion tanks. This has been put out by the United States Bureau of Standards. It covers 13 sizes of range boilers and six sizes of expansion tanks. The pamphlet describing it gives some details as to both together with illustrations. Copies may be obtained for 10c. from the Government Printing Office, Washington.

Wrought Iron Pipe Nipples

Commercial Standard CS 6-29, covering wrought iron pipe nipples, has been promulgated by the United States Bureau of Standards. It gives tables of the standards adopted for different sizes of pipe, and different weights, including stock lengths and taper thread dimensions. The pamphlet, which may be obtained for 10c. from the Superintendent of Documents, Government Printing Office, Washington, gives details also as to the membership of the conference at which the standards were tentatively adopted.



SHORTNESS for Its Capacity Features This Ladle Car. The tilted ladle (unlined) well shows its shape and other characteristics



Attachment bracket
Feed rate adjustable at each bearing
90° or elbow feeder
180° straightway feeder
Sight glass shows feed of oil
90°180° or side outlet feeder
Oil discharge
Indicating and flushing button
Oil return
Multiple feeders for a close group of bearings or hidden bearings 2 to 12 feeds in gang
0° or dead end feeder for branch line
Pump shaft driven from rotating part of machine
Flush
Complete circulation of oil
Filler, dirt proof and non-detachable
Gage glass
Guard rod
Oil reservoir containing circulation pump
Drain plug
Attachment lugs

COMPONENTS of the Blanchard Pulsating Lubricating System Are Shown Above and Construction of the Feeders at the Right

Lubricating System Provides Wide Range of Feed Rates

FROM five to 100 feeders may be supplied automatically with clean oil in individually predetermined amounts by means of the Blanchard pulsating lubricating system illustrated, which is manufactured by the Rivett Lathe & Grinder Corporation, Boston. In addition to flexibility, simplicity and economy are claimed for this centralized oiling system.

An oil reservoir, pump, pressure control valve, single circuit pipe line and feeders, single or in gang, at each bearing comprise the system. Oil is pumped constantly through the circuit at a pressure of about 10 lb. for 95 per cent of the cycle and at 50 to 60 lb. during the remainder of the cycle. This intermittent stepping-up of pressure, through the pressure control valve, serves to lift the needle of each feeder from its seat and admit oil to the bearings. The feeders are spring loaded and may be adjusted over a wide range to permit a feed as low as two or three drops an hour and as high as a small stream at each pulsation. Visible indication of the working of the entire system is provided through the pulsating action of a flush plunger located on the reservoir and a sight glass on each feeder. Oil supply in the reservoir is indicated by a gage glass.

Pumping of oil begins and stops with the machine and the rate of delivery is proportional to the speed of the machine. When unusually cold starting conditions are encountered, the system may be flushed by pressing down the flush plunger on the reservoir. Light or heavy oil of suitable grades may be used. After the initial adjustments of the feeders, the system requires no further attention other than replenishing the reservoir, which holds 3 qt.

The oil reservoir contains the pump and pressure control valve, and may be mounted on the machine or near it, with the pump shaft belted or geared to any rotating member. It is equipped with a permanently attached filler cap, a screened filler opening and a drain plug at the bottom. The pump is a double-plunger unit with piston valves and can be driven in either direction, or reversing. Neither ball nor check valves are employed. The oil intake to the pump is equipped with an accessible fine-mesh screen, providing double filtering of the oil. The pressure control valve is of rotating-plate type and is driven by worm and gear from the pump shaft. Connected with the moving part of this valve and located above the cover of the reservoir is the flush button, which, in making a jump at each pressure pulsation, gives visible indication of the working of the system.

The individual feeders provided at each lubricating point are made in a variety of external forms to facilitate application and piping arrangements. From the line sketch it will be seen that the passage *B* through the feeder is part of the oil circulation line *A A*. The oil flows through *B* under low pressure except when pulsation occurs, when the momentary kick, acting through the passage *J*, lifts the needle *C* from its seat against the adjustable loading of spring *D*, and admits a particle of oil. When the pulsation ceases the needle instantly reseats.

Oil thus taken from the circulation line collects in the chamber *K*, flows down through the passage *F* and drips off the nozzle *G*, the flow being visible through the glass at *H*. Adjustment of the oil supply to the bearing is made through screw *E*, which when turned to the left increases the rate of feed, and when turned to the right, decreases it.

The jump of the needle overcomes any tendency of the oil to film over the feed opening. This opening is located above the circulation line to obviate entrance of foreign matter; the grit or dirt falls back into the line and is carried by the oil stream to the reservoir to be filtered out.

High-Speed Rotor Grinder for Die and Pattern Work

A DIE grinder that is claimed to develop more than ½ hp. at 13,000 r.p.m., which power and speed adapt the machine for smooth clean work with small wheels and points, is being placed on the market by the Rotor Air Tool Co., Cleveland.

The tool is designed to use 1½-in. vitrified wheels, 2½-in. high-speed wheels and ½-in. pencils. It was developed for grinding dies, metal patterns and for use in brass, bronze and aluminum foundries for finish grinding of castings and for scroll work on ornamental pieces. The machine is of simple design and light in weight. A wheel arbor for wheels having a ⅝-in. hole, ⅝ in. wide, is regularly furnished, but arbors for ¼ and ½-in. holes are available as extras. Accessory equipment includes a collet for holding a ¼-in. shank for mounting small wheels and for holding pencil sticks. The same collet may be used for holding a variety of points for special work.

More Than ½ Hp. Is Developed at 13,000 R.P.M.

Trade Rules for Scrap Industry Approved

Federal Commission Accepts Code With Minor Changes —Scrap Institute Sets Up Bureau to Aid in Enforcing Rules

WASHINGTON, July 30. — Rules of conduct for the scrap iron and steel industry were officially promulgated by the Federal Trade Commission last Friday. They are the outgrowth of rules adopted at a conference held at Pittsburgh on May 23 under the direction of Commissioner Garland S. Ferguson, Jr., assisted by M. Markham Flannery, director of trade practice conferences. Except for the omission of the resolution governing compliance with the rules, one minor amendment and rearrangement of the rules into Groups I and II, those announced by the commission appear in the same form as those adopted by the industry and published in THE IRON AGE of May 30, pages 1497-98. The eliminated resolution provided that all violations of the rules be referred "in the first instance to the Institute of Scrap Iron and Steel, Inc., for investigation and adjustment." The amendment directed by the commission substituted the word "misleading" for the word "indefinite" preceding the word "language" in the rule relating to price quotations.

Group I rules are those affirmatively approved by the commission, while Group II rules are accepted by the commission as expressions of the trade. In Group I the commission has included six rules, covering "top dressing" of cars, defamation of competitors, price quotations, interference with contracts, commercial bribery and fictitious bills of lading. Group II also includes six rules, which concern overbilling of cars, arbitration, cost accounting, overweights, failure to fulfill orders and continuance of conference.

A Trade Relations Bureau has been set up in the Institute of Scrap Iron and Steel, Inc., to investigate complaints and assist in the enforcement of the code of business practices, Benjamin Schwartz, director general of the institute, announced following the action of the Federal Trade Commission. It is planned to have special chapter committees appointed to investigate complaints, in the first instance, in the territories covered by the 12 chapters of the institute. The Trade Relations Bureau will receive reports, will conduct supplementary investigations, if necessary, and will make recommendations as to the disposition of each case. The following statement was issued by the Trade Relations Bureau, with the approval of Mr. Schwartz:

The date on which these resolutions become effective is July 26, on which the commission published its official report. The grouping of the resolutions in two groups is a technical proceeding, and does not affect the merits or the effectiveness of the resolutions. The resolutions that are approved by the commission are binding on the entire industry, whether members sign them or not. It is, however, understood that the Federal Trade Commission requests the business men of an industry to sign the resolutions, as a means of ascertaining who will cooperate with the commission.

The single resolution that was disapproved by the commission does not concern a trade practice, but deals with the matter of enforcement. In view of the policy of the Federal Trade Commission to look to an industry for the enforcement of its own code, a resolution to that effect does not require approval by the commission. In line with this policy, a Trade Relations Bureau has been established by the institute.

The following resolution was adopted by the executive committee of the institute at its last meeting:

Whereas, compliance with these rules is essentially a matter for the industry, itself, and whereas, it is desirable that outside agencies of enforcement should be used as a last resort and that violations be adjusted expeditiously and without notoriety within the industry, therefore be it resolved: that it is the sense of this conference that all violations of these rules be referred in the first instance to the Institute of Scrap Iron and Steel, Inc., for investigation and adjustment.

The Trade Relations Committee is composed of the following: Charles Dreifus, Pittsburgh, chairman; Charles Bock, Buffalo, co-chairman; Joel Claster, Reading, Pa.; Harry Ehrlich, Springfield, Mass.; Joseph G. Hitner, Philadelphia; Herman D. Moskowitz, New York; John R. Briggs, Philadelphia; George B. Doane, Boston; Ben Cohen, Wilkes-Barre, Pa.; Joseph Maher, Buffalo; Carl R. Briggs, Blue Island, Ill.; Samuel N. Summer, Columbus, Ohio, and Morris Speer, Cleveland. Joseph Colvin will be secretary of the Trade Relations Bureau.

Recoveries of Non-Ferrous Metals Larger

WASHINGTON, July 30.—Showing an increase of $21,271,500 over 1927, the value of certain non-ferrous metals recovered from secondary sources in 1928 has been reported to the Bureau of Mines as $277,623,500. According to J. P. Dunlop, who compiled the figures, the increase in total value was due mainly to larger recoveries of copper, brass, lead and nickel and to the higher average price of copper in 1928, for the average prices of lead, zinc, and tin were considerably less in 1928 than in 1927. There were large gains in the quantity of secondary copper, lead and nickel in 1928, small increases in secondary zinc and aluminum and small decreases in tin and antimony. The quantity of copper, including that in brass, increased more than 46,000 tons.

There was a continuation of large shipments of scrap copper and brass to Europe. In 1927 the combined exports were 68,706, net tons and last year they were 70,146 tons. The combined imports of copper scrap and brass scrap in 1928 were about 11,400 tons, mainly from Canada and Latin America. The main increase in lead was in the output of secondary pig lead by smelters which treat mainly ore. The increase at these plants was about 17,500 tons, while at regular secondary plants it was only about 1500 tons. Secondary lead recovered in alloys increased 13,600 tons. Zinc recovered by redistillation increased nearly 6000 tons, while that recovered by sweating and remelting was about the same in 1928 as in 1927. Exports of zinc dross decreased 1300 tons, but the quantity used in zinc dust, lithopone, and zinc chloride increased about 9000 tons.

Detinning plants treated a larger quantity of clean tin plate clippings in 1928 than in 1927, but the recovery from such clippings was less. It is reasonable to assume, according to Mr. Dunlop, that the efficiency of detinning plants has not decreased in the last 10 years, yet the yield of tin per gross ton of tin plate clippings, according to reports filed with the Bureau of Mines, has declined from 36.27 lb. in 1918 to 30.3 lb. in 1928. Only a few old tin coated containers were treated last year, for the much lower prices of tin made the handling of them unprofitable. About two-thirds of the recoveries at detinning plants were as tin content in tin tetrachloride and tin oxide.

The report stated that profits in most lines of secondary metal recovery were larger in 1928 than for several years, and operations were on a sounder and less speculative basis. The range in metal prices was not large and secondary metal dealers and smelters relied more on ordinary profits of buying and selling. Mr. Dunlop said that there seems to be need of improved business methods, since profit in handling certain scrap metals and drosses is said to be very small.

More Coke Ovens in Boston Region

The New England Coal & Coke Co., Everett, Mass., a subsidiary of the Massachusetts Gas Co., has contracted with the Koppers Co. for a battery of 82 Becker type coke ovens to be ready for operation July 1, 1930. With the completion of this battery, the company will have 437 ovens; the new battery will increase the annual production by 500,000 tons of coke. The company is selling coke to the Boston Consolidated Gas Co., for gas making purposes, and has been using high test gas to fire its ovens. With the completion of the new ovens high test gas instead of coke will be sold to the gas company.

Steel Treaters to Discuss Nitriding

A number of papers on the new process of hardening steel at low temperatures by ammonia (the so-called nitriding process) will feature the annual meeting of the American Society for Steel Treating, to be held in Cleveland, Sept. 9 to 13. Ad. Fry, the German inventor of the process, has signified his intention of being present. Papers so far secured for the symposium are:

"A Study of the Nitriding Process," by V. O. Homerberg and J. P. Walsted, Massachusetts Institute of Technology, Cambridge, Mass.

"A Few Fundamentals of the Nitriding Process," by H. W. McQuaid and W. J. Ketcham, Timken Detroit Axle Co., Detroit.

"Researches of Nitriding Steels," by Dr. O. E. Harder, J. T. Gow and L. A. Willey, University of Minnesota, Minneapolis.

"Short Time Nitriding of Steels in Molten Cyanides," by A. B. Kinzel and J. J. Egan, Union Carbide & Carbon Research Laboratories, Long Island City, N. Y.

"Observations upon the Iron-Nitrogen System," by Samuel Epstein, Illinois Steel Co., South Chicago, Ill.

"Investigations in Nitriding," by Robert Sergeson, Central Alloy Steel Corporation, Canton, Ohio.

"The White Layer in Gun Tubes," by H. H. Lester, Watertown Arsenal, Watertown, Mass.

Headquarters for the Steel Treaters will be at the Hotel Cleveland. Other organizations cooperating in the National Metal Congress are the Iron and Steel Division and the Institute of Metals Division of the American Institute of Mining and Metallurgical Engineers (headquarters at Hotel Cleveland), the Iron and Steel Division of the American Society of Mechanical Engineers (headquarters at Hollenden Hotel), and the American Welding Society (headquarters at Statler Hotel).

Gear Manufacturers to Meet in Philadelphia

The fall meeting of the American Gear Manufacturers Association will be held at the Benjamin Franklin Hotel, Philadelphia, Oct. 24, 25 and 26, instead of at Briarcliff, N. Y., as first reported.

In addition to papers and addresses on technical developments and on subjects of general interest, recommended practices will be submitted by the association's technical standardization committees. T. W. Owen, 3608 Euclid Avenue, Cleveland, is secretary of the association.

Announce Aeronautic Meeting Papers

The joint meeting of the Society of Automotive Engineers and the Aeronautical Chamber of Commerce of America, to be held at the Hotel Hollenden, Cleveland, Aug. 26, 27 and 28, will feature papers on a variety of topics, including materials and welding. E. H. Dix, Jr., Aluminum Co. of America, Pittsburgh, will present a paper on the "Characteristics and Prevention of Corrosion of Strong Light Alloys," and H. S. Cooper, Beryllium Corporation of America, will speak on "Beryllium Alloys." A paper on "Welding Aircraft Parts" will be read by R. M. Mock, Bellanca Aircraft Corporation, Wilmington, Del.

Other topics include design of wings, gaging engine performance, high-temperature liquid-cooled engines, geared engines, load factors for aircraft structures, variable pitch propellers, load ratings of commercial airplanes and the selling of airplanes to business houses.

Produces Ball Bearings for Aircraft

Fafnir Bearing Co., New Britain, Conn., to meet the requirements of the aircraft industry, has produced a series of ball bearings of narrow width and dimensioned in inches and major fractions. This so-called "S Series" ranges from ¼ to 1 in. bore by seven steps, and has been designed by its recently organized aeronautical division to fill the needs for more rigid, frictionless and wear-resistant control mechanisms on aircraft.

Strategic Metals and Minerals

The United States Department of Commerce has issued Trade Promotion Series, No. 76, entitled "Mineral Raw Materials" (Price 45c.), a comprehensive survey of the production and consumption of metals and minerals.

This study is divided into two parts. In Part I each country is treated separately to indicate the magnitude of its requirements for each of the minerals and its ability to supply these from within its own borders, followed by a statistical analysis of production, imports, and exports covering the 5-year period 1923-1927.

In Part II each mineral is considered separately in its relation to the general world position of the various minerals and the relative positions occupied by each of the countries under review. Major sources of minerals are indicated.

Decrease in Imports of Pig Iron in June

WASHINGTON, July 26.—Imports of pig iron in June dropped to 11,396 gross tons from 14,393 tons in May. Last year the June total was only slightly heavier than in 1929.

For the six months, imports at 73,461 tons have been slightly less than the 75,295 tons of last year. There has not been much change in the line-up of countries of origin, although a heavy decline in incoming shipments from Great Britain, coupled with a moderate rise in those from India, brought the two close together at the end of June.

UNITED STATES IMPORTS OF PIG IRON BY COUNTRIES OF SHIPMENT

(In Gross Tons)

	June		Six Months Ended June	
	1929	1928	1929	1928

Completing Development of Haystellite Cutting Tools

It is expected that new tungsten carbide cutting tools bearing the name of Haystellite will be placed on the market before the end of the year by the Haynes Stellite Co., Kokomo, Ind.

The material is a modification of the alloy introduced by the company a short time ago for use as a diamond substitute on oil well bits and for drawing dies. It is not to be confused with Stellite, being radically different in composition, and is to be distinguished from most of the tungsten-carbide tools at present on the market in that it is a cast rather than a sintered alloy. Uniformity of product is a feature claimed.

Tests have been under way for several months in large production shops, and the alloy, so far as cutting tools are concerned, is in the final development stage. The company expects to be able to furnish sample tools in the near future.

Farrell-Cheek Expansion

The Farrell-Cheek Steel Foundry Co., Sandusky, Ohio, has found it necessary to make further additions to its foundry building. Construction is now in progress of a new addition that will be 60 x 100 ft. and will be used to house special steel operations. The building, it is expected, will be ready for occupancy by Sept. 1.

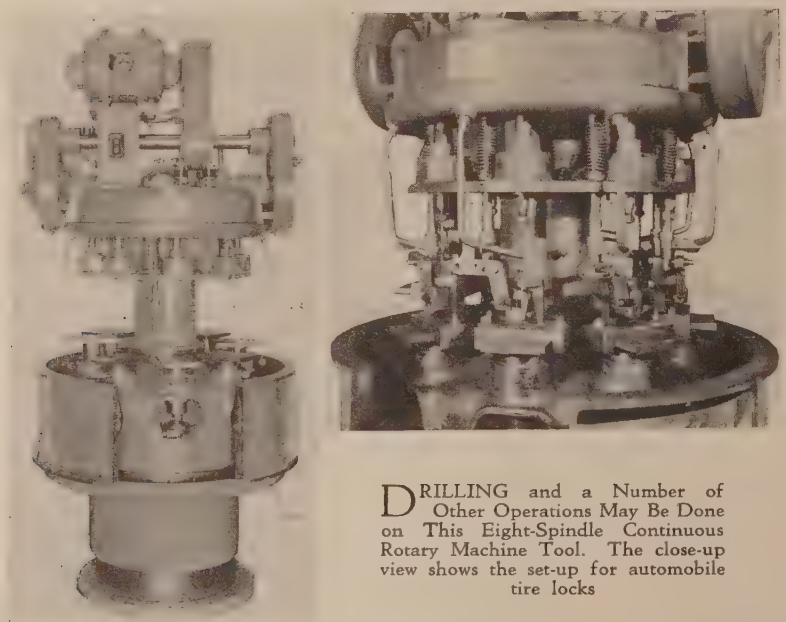
The building runs east and west and is part of the present structure. The core room of the foundry is now three times its former size and the addition now being built was necessary despite the fact that the capacity was doubled only last November.

Plans for other additions are under consideration and may be settled in the near future.

Continuous Type Rotary Machine Has Wide Range

IN drilling, tapping, threading, hollow milling, countersinking, facing and other operations, the eight-spindle continuous rotary machine illustrated is claimed to give high production, with savings in labor and floor space.

When only one operation is performed on the machine, eight pieces are finished at each complete revolution of the carrier, which rotates continuously about the column. A battery of the machines may be synchronized for successive operations, or a single machine may be tooled for drilling, reaming, facing, etc., the same piece. In the latter case the tools are mounted in sequence in the spindles, and the operator advances the piece one spindle each time it comes around to him until the piece is finished, putting a fresh piece under the spindle that performs the first operation. The machine is built by the Enterprise Mfg. Co., Third and Dauphin Streets, Philadelphia.



DRILLING and a Number of Other Operations May Be Done on This Eight-Spindle Continuous Rotary Machine Tool. The close-up view shows the set-up for automobile tire locks

The rotating carrier mounts on its upper part the driving mechanism and the spindles, and on its lower part, the work-tables. There is a table for each spindle, and both move with their centers always in line. The work is fed to the tools, the spindles having no vertical motion. During each revolution of the carrier each table drops clear of the tool and is again raised and fed to the tool, the feed being obtained by a fixed ring cam and a roller at the bottom of each table plunger.

When the machine is on single operation work, the sole duty of the attendant is to unload and reload and clamp the work as it comes to the loading station. When automatic clamping jigs are used his task is reduced to merely moving the work in and out of the jig. Knock-outs, indexing jigs and other devices that can be actuated by a supplementary cam may be employed on the machine.

The machine is of simple design and has no small or delicate parts. It is equipped with motor drive, all-geared head and ball bearings. The spindle drive is through spur and bevel gearing at the right-hand end of the pulley or drive shaft, and variations in spindle speed are obtainable through change gears. The carrier is driven through change gears, planetary and bevel gearing at the left-hand end of the pulley shaft. The smallest member of the planetary gearing is 5 in. in diameter. The carrier drive, as well as each work-table, is protected by a shear key. All gears and other rotating parts are inclosed. Coolant is supplied only while the tools are cutting and chips are disposed of at every revolution of the table.

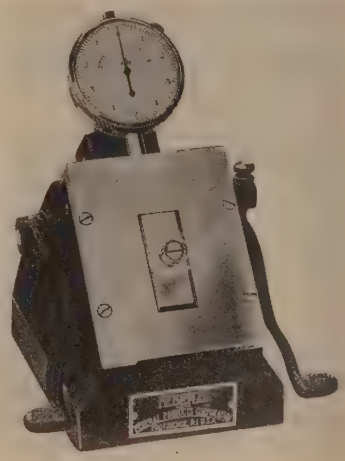
Individual adjustment is provided for each work-table by means of a right and left-stem that extends entirely through both parts of the table plunger. Simultaneous adjustment of all tables is made by rotating the large nut on the column by means of the crank and worm geared to it.

Equipped with the standard cam, the machine has capacity for drilling a ¾-in. hole in cast iron, a ⅝-in. hole in medium carbon steel to a depth of 1¼ in. Facing cuts up to 1/16 in. deep and 1½ in. in diameter may be taken in cast iron and up to 1/16 in. by 1¼ in. in steel. The total movement of the standard cam is 2 in. and of the special cam 3 in. The distance from the spindle to top of the table at highest point of the cam is 16¾ in. maximum and 10 in., minimum. The distance from center to center of spindles in a circle is 9 in. The maximum height of the table from the floor at the loading station is 42 in. The driving motor ranges from 5 to 15 hp. according to character of work. Floor space occupied by the machine is 4 x 4 ft., and the weight is approximately 5000 lb.

# Indicates 0.0001 In. Variations in Size of Small Holes

SIZE variations and amount of out-of-roundness of holes ranging from ⅜ to 1½ in. are determined rapidly by means of the gage illustrated, size variations down to 0.0001 in. being read directly from the dial and roundness checked merely by revolving the work. Long life is also a feature, it being claimed by the maker, the Federal Products Corporation, Providence, R. I., that the instrument has been known to measure more than 1,000,000 holes.

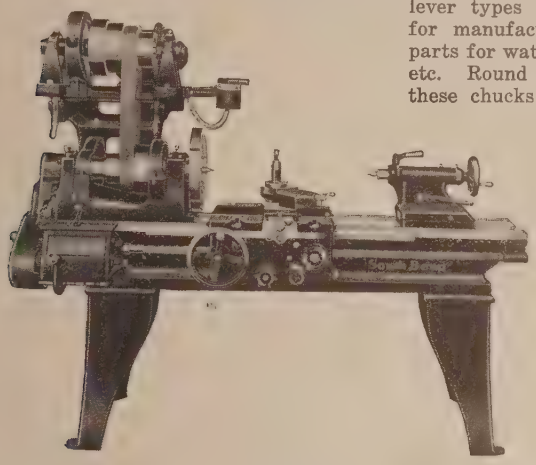
The indicating dial is 2¾ in. in diameter and is graduated in 0.001 and 0.0001 in., the 0.001 in. graduations being ¾ in. apart. The gage may be operated from either side and the parts gaged as rapidly as the operator can place them on the jaws. Setting the gage to measure different sizes of holes is accomplished conveniently by removing the top plate and loosening the screws that clamp the lower jaw in the dovetail, putting a master on the jaws or using a micrometer, as preferred, then setting the jaws so that the indicator registers about 0.001 in. on the minus side of zero. The jaws are then tightened and the gage is ready for use. The small knurled screw on the upper right-hand lever is a stop to adjust the range of the indicator.



Jaws are made in four different sizes: ⅜ to ½ in.; ½ to ¾ in.; ¾ to 1⅛ in.; and 1⅛ to 1½ in. One jaw is regularly furnished with the gage, which is designated as the model 36, other sizes being supplied as extras.

New Line of Motor-Driven Engine Lathes

A NEW model silent-chain motor-driven lathe is being built by the South Bend Lathe Works, South Bend, Ind., in sizes from 9 to 18 in., and in several different types, including bench, tool-room, manufacturing the gap bed, equipped with either standard or quick change gears.



BELT Shifting Is Facilitated by the Tilting Motor Table. The drum type control switch is within easy reach of the operator

The machine is self-contained and requires no more floor space than the countershaft driven lathe. It is equipped with a reversing motor mounted with the driving cone on a table above the machine. This table is supported by a bracket securely fastened to the lathe bed and is arranged so that it may be tilted forward by means of a convenient lever to relieve belt tension and facilitate belt shifting. Independent adjustment is provided for taking up belt slack. From the motor, the drive to the upper cone is by silent chain, which is provided with a felt wick oiler and is entirely inclosed by a guard of improved design. A special guard that covers the driving cone, the belting and the spindle can be furnished if desired. The size of motor varies from ¾ to 3-hp., according to the size of lathe.

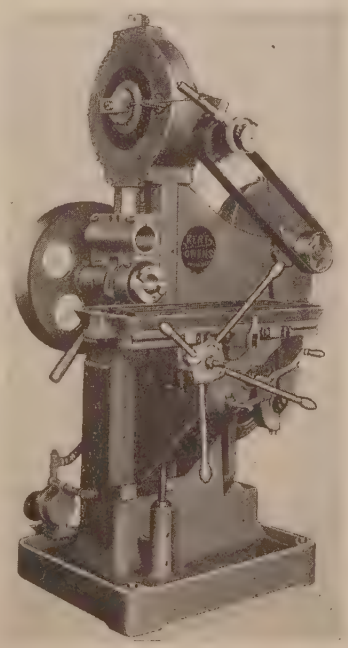
Drum-type reversing control switch is employed, it being considered the most practical for a motor-driven screw-cutting lathe because of the continual starting, stopping and reversing the lathe spindle. Wiring from the motor to the switch is inclosed in flexible metal conduit.

The bronze spindle bearings are lubricated from an oil cup with hinged lid, the oil flowing down around the upper half of the bearing to wicks located in small squares milled out of the lower half of the bearing at the point where it meets the upper half. This system is intended not only to assure adequate supply of oil, but to keep dust and dirt from the bearings. Felt shear wipers are provided for the V-ways of the bed. The machine is equipped with an automatic interlock to prevent simultaneous engagement of the automatic feeds and the half nuts for thread cutting. The tailstock has a set-over for taper turning and a binding lever that locks the spindle without disturbing the alinement. The spindle is graduated in 1/16 in.

Attachments include handwheel and lever types of draw-in collet chuck for manufacture of small precision parts for watches, typewriters, radios, etc. Round split collets for use in these chucks are made in a number of sizes, and square and hexagon types can be furnished. They are hardened and tempered and ground both inside and outside. A spindle nose collet chuck, for large collets, is also made.

Milling Machine With Cam Feed to Head

CAM feed to the head, permitting use of a feed or rate of travel to suit any change in cross section of the cut, thus assuring maximum output, is a feature of a new production milling machine put out by the Kent-Owens Machine Co., Toledo, Ohio. This feed may be operated continuously or disengaged automatically upon completion of the cycle. With continuous operation, the operator simply loads and unloads the work and if an indexing fixture can be used, production may be further increased, one side of the fixture being loaded while the work in the other side is being milled.



Cam-Actuated Head Permits Use of Feeds to Suit Changes in Cross-section of Cut

The machine may be arranged for either countershaft or motor drive. From the motor, which is mounted on the back of the column, the drive is by silent chain to the backshaft, from which the power is transmitted by belts to the vertical feeding mechanism and the spindles. Both the backshaft and the spindle are mounted on Timken roller bearings, and a heavy flywheel is provided on the spindle to prevent chatter and vibration. The spindle is of standardized type. The cam drive is through a hardened steel worm and bronze worm wheel, wear between which is taken up by means of an eccentric bushing. Both the cam and follower are of hardened steel. Cams to suit particular requirements can be furnished.

Conditions In Germany May Widen Machine Tool Market

Changed conditions in Germany that improve the outlook for sales of American machine tools in that and other European countries are pointed out by E. F. Du Brul, general manager of the National Machine Tool Builders Association, in a recent bulletin to member companies.

It seems probable, the bulletin states, that the reparations settlement will do much toward clarifying conditions in Europe and will encourage industrialists to proceed at a more rapid rate than in the immediate past.

"Until recently the German situation, in particular, has been quite discouraging. As recently as the first of March there were in Germany 2,460,000 receiving unemployment dole, but by April 30 this had been reduced to 1,100,000, or to more than one half in less than two months. Part of the unemployment of course was largely influenced by the building trades and other industries which depended on weather conditions. Nevertheless, the change has been quite remarkable.

"It also seems probable that reparations in kind will have a tendency to decrease, and that this will tend to relieve the United States from this type of competition in France."

The Edward G. Budd Mfg. Co., Philadelphia, reports a production of 1,233,323 steel automobile doors for the first six months of 1929. This compares with the production of 1,317,507 doors during the entire year 1928.

Where Steel Exports Went in First Half-Year

Canada Took 393,731 Tons of Nine Leading Items—Japan Retains Second Position with 81,004 Tons, Followed by Argentina, 30,807 Tons; Philippines, 25,019 Tons; Mexico, 20,382 Tons

Exports from United States, by Countries of Destination

Strong Steel Earnings Statements

Quarterly Reports of United States and Bethlehem Steel Corporations and Others

TOTAL earnings of the United States Steel Corporation for the three months ended June 30 amounted to nearly $72,000,000. This compares with $60,105,381 for the first quarter and with $46,932,986 for the corresponding quarter last year. The earnings of the second quarter of 1917, a war year, were $90,579,204.

Income available for common stock dividends and surplus amounted to $47,520,924. The regular common stock dividend of 1¾ per cent was declared on 8,030,304 shares, being 7,116,235 shares previously outstanding plus 914,069 fully paid for under the subscription offer of April 16. Thus there are 102,536 shares under the subscription offer that have not yet been taken or fully paid for. On the basis of the 8,030,304 shares, the net income in this last quarter was at the rate of $5.92 per share, but on the basis of the earlier number of 7,116,235 shares, the income was $6.68 per share and compares with $5.04 for the first quarter.

Total earnings of the first half of this year were $132,100,842 and those for the first half of 1928 were $87,-867,018. The accompanying table gives the principal figures.

May Acquire Columbia Steel Corporation

No official statements have been made with regard to reports that the United States Steel Corporation is negotiating to secure the property of the Columbia Steel Corporation. What it would acquire includes a modern blast furnace near Provo, Utah, with a by-product coke oven plant of 850 tons daily capacity; rolling mills at Pittsburg, Cal., and at Torrance, Los Angeles, making steel bars, sheets, wire and nails; steel casting plants at Pittsburg and Portland, Ore., and raw material properties.

The steel foundry at Pittsburg was described in THE IRON AGE of Jan. 23, 1919, and the rolling mill at Pittsburg, the open-hearth furnaces and 18-in. and 12-in. bar mills, were illustrated in the issue of June 24, 1920. The Torrance plant was originally owned by the Llewellyn Iron Works but has been enlarged in both the steel making and rolling departments. Columbia's entering in the sheet business was the result of the purchase of the plant of the Pacific Sheet Steel Co. in South San Francisco.

Bethlehem Earns $5.33 a Share

THE Bethlehem Steel Corporation reported net income for the second quarter of $11,766,473 after interest, depreciation and depletion charges, which was equal, following the deduction of 7 per cent cumulative preferred dividends, to $5.33 a share on the common stock outstanding. This compares with $9,045,590 in the preceding quarter, or $4.05 a share on a smaller number of shares, an additional 600,000 having been issued as of June 19, 1929. Net income in the second quarter of 1928 was $4,529,328, or $1.57 a share on the common stock then outstanding.

The directors declared a dividend of $1.50 a share on the common stock, placing the common shares on a $6 per year basis, compared with $4 previously. They also declared the regular quarterly dividend on the preferred stock.

In commenting on the report, E. G. Grace, president, stated that billed prices showed an encouraging gain over those of the preceding quarter, as well as the corresponding quarter, last year. Current operations are at approximately 99 per cent of capacity and will remain at about that rate through August. In September, fall demands should make themselves felt, and business throughout the rest of the year, judging from present indications, should be in sustained volume, he declared. Recessions in the consumption of steel in some lines, notably the automobile industry, have been offset in large part by increased requirements in other directions. The outlook in structural steel, he said, is unusually promising, and he expects railroad buying to keep up at a good rate. Exports are the largest the company has made since the war, and the reparations settlement is favorable to a continued high volume of foreign trade.

The company has no outstanding improvement program to announce at this time, Mr. Grace said, but the issuance of 600,000 additional common shares in June was for the purpose of furthering general improvements, which are being made continually. Although it was not many months ago that surplus capacity in steel was regarded as one of the main problems confronting the industry, there is no doubt, he stated, that the country would have suffered great harm in recent months if capacity had not measured up to demand.

The Bethlehem corporation's operations during the second quarter averaged 100.6 per cent of rated capacity, compared with 91.9 per cent in the first quarter and 82.5 per cent during the second quarter of 1928.

The value of orders on hand June 30 was $56,829,800, compared with $62,702,683 at the end of the previous quarter and $51,761,908 on June 30, 1928.

Earnings of Other Steel Companies

The Sharon Steel Hoop Co. reports earnings from operations in the first six months of 1929 of $1,761,-208.23, after full charges for maintenance and repairs to plants. After deducting depreciation charges of $507,791.58, bond interest of $177,-864.54 and government profits tax of $131,001.77, net earnings amounted to $944,550.34, as against $971,853.53 for the entire year 1928. This is equal to $2.63 a share on 359,240 shares of stock. During the past six months the company put into operation its new continuous hot-strip mill and cold-rolled strip mill. It is stated that the new departments should add materially to the company's future earnings.

Net income of the Eastern Rolling Mill Corporation in the second quarter was $252,373, after all charges, compared with $203,396 in the corresponding period of 1928.

The Follansbee Brothers Co. earned a net profit of $999,660 in the six months ended June 30. This is after depreciation, interest and federal taxes, equivalent after preferred dividends to $5.05 a share on 180,000 shares of common stock. For the first quarter of 1929 the company reported a net profit of $402,572, equivalent to $1.98 a share.

In the first six months of the year the Sloss-Sheffield Steel & Iron Co. had a net income of $655,878, after depreciation and depletion, but before interest and federal taxes.

Net profits of the Truscon Steel Co. in the second quarter totaled $1,-

Earnings of Steel Corporation

Earnings for Second Quarter

	Total Earnings
April, 1929	$22,361,428
May, 1929	25,604,641
June, 1929	24,029,392
Total earnings after deducting expenses, taxes and interest	$71,995,461
Less charges and allowances for depletion, depreciation and obsolescence	15,919,386
Net income	$56,076,075

Less provision for depletion, depreciation and obsolescence	3,528,967	3,419,306	3,396,995
Net income for period	$11,766,473	$9,045,590	$4,529,328
Less dividends: Pref. stock	$1,750,000	$1,750,000	$1,697,500
Com. stock.	3,600,000	2,400,000	.....
Total	$5,350,000	$4,150,000*	$1,697,500
Surplus for period	$6,416,473	$4,895,590*	$2,831,828

*Adjusted to reflect dividend payable Aug. 15, 1929, on additional 600,000 shares issued June 18, 1929.

003,494, after depreciation, federal taxes and other charges equivalent to $1.59 a share on 589,036 shares of $10 par value common stock. This compares with $785,143, or $1.22 a share, in the same period of 1928.

Campbell, Wyant & Cannon Co. and its subsidiary, National Motor Castings Co., report net profit in the first quarter of 1929 of $531,379, equal to $1.53 a share on 348,000 shares of stock.

Fabricated Structural Steel

About 60 Per Cent of Awards Were in Canada and Northeastern Part of United States

STRUCTURAL steel awards of 34,000 tons in the past week were about equally divided between railroad and industrial work and non-industrial projects. About 60 per cent of the lettings were in Canada and the northeastern section of the United States. Fresh inquiries, totaling 36,000 tons, were slightly larger than those of the previous week.

Among the larger contracts placed were 6000 tons for an office building at Montreal, Que., 3800 tons for an office building at Newark, N. J., 3000 tons for a Chevrolet assembly plant at Tarrytown, N. Y., and 2200 tons for an aircraft manufacturing plant at East Hartford, Conn. New work on which bids are being asked include 8000 tons for approaches to the McKinley bridge at St. Louis, 6000 tons for a State agricultural building at Harrisburg, Pa., and 2200 tons each for a Chicago school and for a mill building for a copper company in Arizona. Awards follow:

BOSTON & ALBANY RAILROAD, 650 tons, roundhouse in Brighton district, Boston, to unnamed fabricator.

BOSTON & MAINE RAILROAD, 250 tons, roundhouse at Somerville, Mass., to Boston Bridge Works, Inc.

BOSTON & MAINE RAILROAD, 350 tons, three bridges at Lansingburg, N. Y., to Boston Bridge Works, Inc.

MONTREAL, QUE., 6000 tons, office building, to Dominion Bridge Co.
